SHOREDITCH, LONDON, E.**SPHINCTER GRIP GARDEN HOSE**

The Sphincter Grip Spring Steel Galvanised Armoured Hose is the most valuable improvement in Hose since 1840. Its lasting qualities are ten times greater than any Hose not armoured.

Its complete success has caused some parties to infringe the Patents owned and controlled solely by us; and we therefore notify all such that the making, vending, or use of any armoured wire-wound Hose not of our manufacture is an infringement of one or more of our several Patents, any violation of which will be promptly prosecuted. Brass plates set between the Hose and wire denote our Manufacture and the Patents.

For Price Lists and particulars of The Original and Only Genuine Sphincter Grip Armoured Hose, APPLY TO THE

### GARDENING APPOINTMENT.

Mr. M. REED, Head Gardener to A. COOPER, Esq., Quarry Hill, Reigate, has been appointed as Head Gardener to A. COOPER, Esq., at his new residence, The Gables, South Bank, Surbiton.

## WANT PLACES.

Letters addressed "Poste Restante" to initials or to fictitious names are not forwarded, but are at once returned to the writers.

**NOTICE TO ADVERTISERS.**—In many instances Remittances in Payment of Repeat Advertisements are received without name, address, or anything beyond the postmark on envelope by which to identify the sender; this in all cases causes a very great deal of trouble, and frequently the sender cannot be identified at all.

Advertisers are requested when Remitting to give their Names and Addresses, and also a Reference to the Advertisement which they wish repeated.

**POSTAL ORDERS.**—To Advertisers, Subscribers, and Others:—It is very important by Postal Order that it should be filled in payable to No. 42, DRURY LANE, to W. RICHARDS, as, unless the number of a Postal Order is known, and it has been made payable at a particular office, and to a particular person, it is impossible to present any person into whose hands it may fall from negotiating it.

N.B.—The best and safest means of Remitting is by POST-OFFICE ORDER.

### Head Gardeners.

**JOHN LAING AND SONS** can at present recommend with every confidence several energetic and practical MEN of tested ability and first-rate character. Ladies and Gentlemen in want of GARDENERS and BAILIFFS, and HEAD GARDENERS for first-rate Establishments or Single-handed Situations, can be suited and have full particulars by applying at Standish Park and Rutland Park Nurseries, Forest Hill, London, S.E.

**WANTED, A GARDENER!!!**—Having had long experience and an extensive connection we are in a position to RECOMMEND MEN thoroughly capable of filling with credit any situation in the Gardening World. On receipt of full particulars we will recommend a suitable man. Correspondence invited.—R. B. LAIRD AND SONS, Successors to Downie & Laird, Seed Merchants, Edinburgh.

To Noblemen and Gentlemen requiring Land Agents, STEWARDS, BAILIFFS, or GARDENERS.

**JAMES CARTER AND CO.** have at all times upon their Register reliable and competent MEN, several of whom are personally well known to Messrs. Carter, Enquiries should be made to 237 and 238, High Holborn, W.C.

**SHOPMAN, or ASSISTANT.**—Twelve years' experience; thorough knowledge of Farm and Garden Seeds, Bulbs, Sundries. Knows Plants well.—P. INNES, 35, Rose Street, Garneithill, Glasgow.

**SHOPMAN, or ASSISTANT.**—Age 23; seven years' experience in all branches of the trade in first-class tenders. Highest references.—C. B., Mr. Currie, Stationer, Girvan.

**TO THE SEED TRADE.**—Wanted, by a young man (age 24), a situation in either Wholesale or Retail Seed Establishment. Seven years' experience in General Nursery Work.—C. H., The Royal Nurseries, Slough.

**HOLLOWAYS' OINTMENT and PILLS.**—His Consumption prevented.—Influenza, colds, and fever are ever prevailing in our changeable climate. Who does not cure at first, when neglected they frequently induce serious diseases, of which the chief and most fatal is consumption. If Holloway's Pills be resorted to on the first appearance of any of these diseases, and if the symptoms be very urgent, the Ointment should also be well rubbed twice a day on the back and chest; they will cease to cause alarm, and consumptive tendencies will certainly be banished, and the body, freed from all impurities, will be left in a healthier state than it was before the illness. The Pills, being free from noxious ingredients of any kind, the most delicate and timid may harmlessly take them.

## DONATIONS and SUBSCRIPTIONS

## WILL BE THANKFULLY RECEIVED BY

A. F. BARRON, Hon. Sec.,

Royal Horticultural Society's Gardens,

Chiswick, London, W.

## THE GARDENERS' ROYAL

BENEVOLENT INSTITUTION.

NOTICE IS HEREBY GIVEN THAT AN ADDITION will be made to the LIST of PENSIONERS of this Institution in JANUARY NEXT. All Persons desirous of becoming Candidates are required to send in their application to the Committee, with their Testimonials and Certificates, on or before the 5th November next, after which day they will not be received. Preference will be given to those Candidates or their Widows who have been Subscribers for more than four years at least. Should there not be a sufficient number of these candidates to fill the vacancies, then the applications of those who have not subscribed so long or not at all will be considered.

By order, EDWARD CUTLER, Secretary.

50, Parliament Street, London, S.W., October 3, 1888.

P.S.—Printed Forms of Application may be obtained from the Secretary.

## THE PARKS COMMITTEE of the Halifax

Corporation are prepared to RECEIVE TENDERS for the SUPPLY of 100 to 150 feet in height, of any of the following species:—Western Plane, Lime, Sycamore, Wych Elm—delivered at Savile Park, Halifax, before November 30, 1888. Tenders, endorsed "Tender for Trees," must be sent to the undersigned before November 10, 1888.

By order, KEIGHTLEY WALTON, Town Clerk.

Town Hall, Halifax, September 27, 1888.

## Borough of Penzance.

TO LANDSCAPE GARDENERS.

Extension of Time.

THE PENZANCE TOWN COUNCIL invites

PLANS for LAYING OUT as PUBLIC WALKS and FLEETING GROUNDS the Morrell House Property. A Report explanatory of the details of the plan and estimated cost must accompany each design. Premiums of Twenty and Ten Guineas will be given for the best and second best Designs respectively. Should the Author of the Premiated Plan be selected to carry out the work the Premium will merge in the Commission. The Premiated Plans to become the property of the Council. The Grounds to be laid out—4 acres in extent, and having frontage to a southern slope—can be seen on application to the Borough Surveyor, from whom a Plan may be obtained on payment of £1, which will be returned to those forwarding design.

Plans, &c., with distinguishing motto and name in sealed envelope, to be sent to me at my office, Public Buildings, on or before OCTOBER 27 next, instead of 20th instant, as previously advertised.

THOS. CORNISH, Town Clerk.

Penzance, Oct. 9, 1888.

## CLUES BROTHERS,

SEEDSMEN, FLORISTS, & DUTCH BULB IMPORTERS.

In succeeding to the business lately carried on by G. H. HEWSON, at the above address, we wish to intimate to his Customers and the Public generally that their intention is to supply every thing connected with the trade of the purest quality and on the most reasonable terms, trusting thereby to insure the confidence and support so liberally accorded to their predecessor. The experience of W. CLUES (Manager), in some of the leading firms—viz., Messrs. Downie, Laird & Laing, Florists to the Queen, Edinburgh and London; Messrs. James & Co., Sheffield; and Messrs. Edward Webb & Sons, the Queen's Seedsmen, Worsley, Stourbridge, will, we trust, be sufficient guarantee of his efficiency in the trade.—September 25, 1888.

## HELLEBORUS NIGER, OR CHRISTMAS ROSES.

I can offer a magnificent lot of Christmas Roses, probably the finest lot in the Trade, especially of the H. niger major variety, which is the great favourite among market growers. These now offered are home-grown clumps full of flower-buds, and will be ready to lift in October; and I would advise early orders to secure them, as the stock of fine clumps is very limited.

### MAXIMUS.

A robust variety, the largest of the group, and very ornamental as a foliage plant. Its flowers in October and November, the blossoms are large and white, shaded with rose in the exterior, and generally produced in twos, but if shaded or a glass placed over the plants, the flowers are then pure white. By shading the flowers can be retarded even to December. It is the most vigorous of the section, and succeeds where many of the others fail to grow.

### MAJOR.

Although this plant is frequently offered, it is seldom to be obtained true to name, owing to its great value for cutting purposes. The flowers are pure white under glass, but have a slight rosy tinge in the open; it is the greatest favourite among market growers, producing flowers from December to January. It is a grand variety for potting, the foliage is so close and compact, and the flowers abundant.

### RUBRA.

One of the most distinct and novel of this group. The flowers are large, produced about the end of January, and of a lovely colour. It is a robust grower, free blooming, and a decided acquisition for cutting.

### RIVERSTON.

A fine distinct variety, somewhat in the way of H. maxima, but with smaller foliage, yet a strong robust variety. The flowers are produced in pairs, pure white, and blooming in the open at Christmas, a little earlier than major and later than maximus, thus forming a nice succession, and will be found a fine addition to our list of these useful winter-blooming plants.

### COLLECTED PLANTS.

These are far superior to the ordinary stuff generally offered, which are usually dried up and half dead before received, being collected by inexperienced men; those now offered are fine healthy plants, and usually are as fresh as when first lifted, and always do well.

Prices on application.

**THOMAS S. WARE,**  
HALE FARM NURSERIES,  
TOTTENHAM.

## PALMS, FERNS.

**K. DROST** begs to offer to the Trade a very extensive and unusually well-grown stock of Palms for Decorating purposes, for Table Plants (nicely shaped), and for growing on, consisting of KENTIAS, COCOS, LATANIAS, ARECAS, CORYPHAS, PHENIX, BUTTERFLY, &c.; and further, a large quantity of extra good PTERIS TREMULA and DORYOPTERIS PALMATA in 48-pots, ADIANTUM VICTORIAE, in 60-pots, and thousands of SMALL FERNS of the best Market varieties.

AN INSPECTION INVITED.

# CARTER'S CHEAP BULBS.

Why Send to Holland for Bulbs

When Better Quality can be obtained in England at Less Prices? Note the Contents, and compare Carters' Box with others.

**Carters' Guinea Box**  
Contains 1250 Bulbs,

And is sent, PACKING and CARRIAGE FREE to any station in England and Wales on receipt of cheque or postal order for 20s. It comprises the pick of the World, as follows:—

50 Hyacinths, named, in 9 colours	100 Crocus, yellow
50 Tulips, double, early	50 Anemones
50 Tulips, single, early	100 Daffodils
100 Narcissus poeticus	50 Ranunculus, Persian
50 Narcissus biflorus	50 Spanish Iris
25 Scilla sibirica	50 Triteilea uniflora
25 Scilla campaulata	50 Snowdrops
100 Crocus, white	100 Winter Aconites
100 Crocus, purple	36 Star of Bethlehem
100 Crocus, striped	14 Muscari botryoides

Half the Box, 11s. Carriage Free; Quarter, 7s., Carriage Free.

For full particulars of other Boxes, from 5s. upwards, see CARTERS' ILLUSTRATED CATALOGUE OF BULBS, Gratis and Post-free.

Seedsmen by Royal Warrants to H.M. the Queen and H.R.H. the Prince of Wales,

**237 & 238, HIGH HOLBORN, LONDON.**

## "EVERGREENS."

Stock quite UNEQUALLED for superior QUALITY.

IMMENSE variety and great extent.

Inspection earnestly invited.

**DICKSONS Nurseries, Chester.**  
(Limited)

**TEA ROSES:** A grand stock, in 5-in. pots, 12s. & 18s. doz.

**GRAPE VINES:** A grand stock, in 7-in. pots, 24s. & 30s. doz.

Black Hamburg and other varieties. Suitable for fruiting in pots, 10s. 6d. each. Suitable for planting viciaries, 5s. and 7s. 6d. each.

**FERNS:** A fine stock, in 5-inch pots, 12s. per dozen.

A fine stock, in small pots, 4s. per dozen.

Catalogues on application.

## RHODODENDRONS.

An immense Stock. 200 Named Sorts, from 1 foot to 5 feet high, including many varieties of our own raising, in addition to the best varieties of other raisers.

## AZALEAS.

Many thousands of Azalea mollis and other choice varieties, well-budded plants.

Silver-variegated, Hodgins' and other Hollies. Of these we have a surplus stock, and can offer them at low prices.

Priced Descriptive CATALOGUE of the above and General NURSERY STOCK free on application.

ISAAO DAVIES & SON, Nurserymen, ORMSKIRK.

# SUTTON'S

INIMITABLE

## BEDDING HYACINTHS

In distinct shades of colour, and to flower simultaneously.

Scarlet, Dark Rose, Light Rose, Blue, Light Blue, Dark Blue, Pure White, Tinted White.

# SUTTON'S

INIMITABLE

## BEDDING TULIPS.

For simultaneous flowering.

White, Yellow, Scarlet, Rose and White, Crimson, Purple, Lilac, Bright Rose, Crimson and Gold.

Amateurs frequently experience difficulty in choosing exact colours of Hyacinths and Tulips for Bedding. This difficulty is removed by using SUTTON'S INIMITABLE HYACINTHS and TULIPS, from which have resulted some of the most brilliant displays of these charming flowers ever seen in the open ground.

## Gardeners' Chronicle.

SATURDAY, OCTOBER 13, 1888.

## A HERTFORDSHIRE FRUIT NURSERY.

THE goal of the day's excursion was the world-famous nursery of Messrs. Rivers & Son, at Sawbridgeworth—a name which always conjures up pleasant pictures in fruit-growing—an agreeable day, spent, if you are fortunate in the day, with a most genial, and, in fruit-lore, most learned of our nurserymen.

Nowhere in these islands are so many object-lessons in practical fruit-growing to be found as here, for you are not only shown the young trees in every stage of youthful development, as maidens and trained in almost every fashion, but as fully grown, and in quantity from a few rods to several rods. This nursery, it may be stated, is best reached—from London, at least—from the Great Eastern Railway, Cambridge line, at Harlow.

On the present occasion the first visit paid was to a nursery of quite young stuff at the farm—for Mr. Rivers is a farmer as well as nurseryman. Here were found on ten acres of really stiff clay soil Apples, one and two-year old plants, budded on Paradise and Crab, smooth in the skin, and straight as could be wished—precisely the kind to plant before the head is formed—that can come afterwards. By planting young vigorous Apples before the roots have rambed far from home, there is little mutilation of roots in digging out, as is so often, and perforce must be, the case with trees more than two years in the lines after being budded or grafted. From such kind of trees the planter can form whatever form of tree or bush he may wish, as these are in all cases the foundation on which the superstructure—be it round-headed orchard tree with a 6 or 7 foot stem, a bush with lesser-sized head and stem of 2 feet or nothing at all, pyramids, cordons of all kinds, vase, espalier, or fan-trained—is raised. Pears and Plums were likewise found in very

large numbers in these plantations at the farm. Amongst them some are found which do not succeed—make growth weakly or slowly. These are of a certainty marked for extinction; as nothing which must be coddled to make it a tree is tolerated; and it is only when a great number of varieties of any kind of fruit is grown under the same sort of conditions that it is easy to pick out the “weeds.”

A great hedge—or, rather, two hedges—protect this young nursery from the north wind. It is an old English lane, such as all lovers of the picturesque in scenery would admire, which skirts the nursery, and which is bounded on either hand by these old hedges of *Ulmus glabra*, *U. campestris*, Hazel, Holly, and other trees whose seeds, in most instances, have blown thither. It is not neat, it might even be considered but little to the credit of the farmer by one of the modern school, but it is a protection, and a good one, to the nursery of young trees. Time nor space permits us to repeat all the encomiums which were lavished by Mr. Rivers on the lane and its hedges, so we will get on to the main nursery grounds, nearer to the village of Sawbridgeworth.

**Plums.**—The trees were getting somewhat bare so that the fruit still hanging on them was readily seen, especially Plums. Of these fruits were observed Monarch, the late variety of the future—that is if Mr. Rivers' untired products of hybridisation do not excel it in some points. It is an oval purple-skinned fruit for kitchen use, and a very heavy cropper. Young trees of two and three years bore one to one and a half dozen of fine fruits; and as earnest of his faith in the variety, Mr. Rivers has planted it largely for fruiting. There is doubtless money in a Plum which, in ordinary seasons, does not ripen before the first week in October, and in late ones fourteen days later. Plum Pond's Seedling is too well known to need much said about it here; it is simply a late Denyer's Victoria, and a useful kind. Autumn Compote must be classed with Monarch as a valuable late Plum; it is red in colour, of medium size, and is also an excellent and certain bearer. Late Transparent Gage should be planted generally in the milder parts of the country, either as a bush, standard, or pyramid, doing equally well on them all. It is a delicious fruit with a crackly flesh, ripe usually the first or second week of October from free standing trees, but from trees on all walls but those with a northern aspect it is earlier than this.

Some other varieties of the Plum which are much thought of at Sawbridgeworth, are, among early ones, The Czar—large purplish fruit ripening at the end of July: the tree is hardy and vigorous of growth; Early Rivers and Early Favourite, both purple and of medium size. The first is a seedling from Précoce de Tours, and is an enormous bearer. Grand Duke is a very large black Plum. It is a seedling from Autumn Compote, a red Plum, and ripens about the middle of October. The flavour is good and it is a trustworthy variety to plant.

Many seedling Plums are under trial, and in due course some fine things will be distributed from amongst them. This group of Plums is not the produce of chance seedlings, but rather the result of careful, long carried out experiments, many of them having been initiated by the father of the present owner. After years' of waiting some of these varieties have turned out failures, whilst others have immediately met with approval on their being brought into commerce.

In passing, it may be stated that some of the nursery hedges are of Plum seedlings, Portuguese Quince, and Medlar, the latter budded on the original Whitethorn plant of which the hedge consisted, and allowed to grow free with but little trimming. In good years these hedges, which are both tall and thick, are filled with fruit, and the first two afford much food for the birds, to the benefit of the rest of the nursery.

Some espalier trees of various sorts of Plums were

observed, their branches running perpendicularly. These had been planted for many years, and from the first secured to wires stretched horizontally from oaken posts. The trees were still very fruitful, and had become capable of standing in position without the wires, although these remained. Similar fences made with upright or diagonal cordons are of Apples and Pears, and serve as wind-breaks to protect quarters of fruit in the same way as ordinary hedges would do, with the additional advantage that the hedge will bear some fruit in most years, and good crops in favourable years. One pruning in summer (July) is sufficient with the ordinary winter pruning to keep these plants neat in appearance and fruitful.

**Orchard Management.**—As has already been said, various methods of planting trees for profit may be observed in this nursery, and one of these which will appeal to the intending grower of fruit either on a large or small scale is a quarter, it may be less than a rood, of Apple trees standing at a distance of 9 feet between the rows and 6 feet in the rows. The trees, in many cases carrying heavy loads of fruit, were simply medium-sized standards minus the stem, for in no case was this 2 feet in height, and in many less. Thus the trees were close to the ground, sheltering each other better than standards would do, or being sheltered by the hedges before mentioned; moreover, every part of the tree was readily reached for gathering the fruit and pruning the branches; no ladder with a man or two to use it, which is in itself an expense, but the whole work of gathering may be done by a boy or girl instead. This kind of orchard planting is just what the farmer who can come to satisfactory terms with his landlord, if he be not owner of the land, should plant. And if every farmer occupying 100 or more acres of land would carefully prepare a rood or two, and large holders an acre of sheltered or shelterable land of suitable quality, plant it with the right varieties of Plums, Pears, Apples, and chiefly the first and last, a great quantity of fruit would come on to the market in due course. Of course ground game must be kept out with wire netting, and other trespassers by a steel barbed wire or two at the top. Some of Mr. Rivers' experimental plantations of bush, standard, and pyramid trees are intercropped with bush fruit or nursery stock, some—the oldest—do not admit of this being done, and are bare of all other crops. On a farm or allotment no ground would be under the trees, but there would be turf under the standards where there were no bushes, and such would be fed off by sheep, nothing larger; or Strawberries might be grown, but no vegetables of coarse growth which would rob the soil to the detriment of the permanent crop—the trees. Where dwarf trees of any form are grown there could be no feeding off by sheep, but the grass, if any, would have to be mown.

**Trees in Pots.**—In looking through the many houses splendid Pears and Apples were observed on trees growing in 8-inch and 10-inch pots with a surfacing of manure. Pears and Apples were likewise standing in large numbers in the open, their pots partly sunk into the soil—these likewise bore magnificent fruits. As examples of what may be done in this way in a very small space we may mention four Pear trees—General Todtleben, Triomphe de Jodoigne, Nouvelle Fulvie, and Madame André Leroy, which would be standing on a parallelogram of 4 feet  $\times$  4 feet. There were on these pyramid trees about 60 fruits worth, to the grower from 4d. to 6d. each; therefore, at the lesser sum they would be worth in London, or any large town, £1. This speaks well for the profits of fruit-growing when properly done. Another instance of this was a house which had pot-Vines at the sides, but not much foliage on the roof, and was partly filled in the centre at the time of our visit with Peaches in pots. From this house there had been gathered this year 4000 Peaches from several successional groups of trees, besides Grapes from one hundred pot Vines. The Peaches had all been bloomed in the house, then placed out-of-doors when safe, and again transferred to the house to fruit in succession.

Pears and Apples were found in quantity, growing in small pots—nice pyramidal stuff, well loaded with large fruits, to keep which hanging on the trees as long as was necessary for perfect ripening they were slung each in its bag of coarse fish-netting. The pots are partly plunged in the soil and heavily top-dressed with manure in some cases; in others some special manure—Thomson's or Beeson's, probably—was given occasionally. We saw some very fine Pimston Duchess, Souvenir du Congrès, Marie Louise d'Uccle, Doyné du Comice, Beurré Bâlet, a nice fruit, ripening in a large span-house along with late Peaches, Lady Palmerston, Sea Eagle, Salway, Mr. Gladstone, and others.

A very good method of growing cordon Pears was observed on a southerly sloping trellis of laths enclosed by a wall of boards secured to Oak posts. This trellis was about 1 foot from the soil at the front, and 2 feet at the rear. The trees, which are planted on the outside, close to the boards, may stand 2 feet apart, and are bent at an obtuse angle, and made fast to the trellis. There are great advantages obtained in this way; the trees can be easily protected from frost in the blooming period by means of lights, which can be placed at about 8 inches above them. The fruit is fully exposed to the sun, and it is impossible for the wind, however strong, to blow it off. The score of trees would yield on an average twelve fine Pears each, say forty dishes.

The varieties of the Apples in pots were Emperor Alexander, Dumelow's Seedling, Cox's Orange, Warner's King, very large, quite 5 inches in diameter; the scarlet Golden Pippin, a fruit that has a more juicy flesh than the old Golden Pippin; King of Tomkin's County, very fine showy fruit in pots in the open; Lady Henniker, Grimes' (American) Golden Pippin.

In one of the houses a pot-grown tree of a late, showy, scarlet-fruited Cherry was noticed—Tardive de Winkle. It is tender, fleshy, sweet, large, and will hang till the end of October—a great acquisition in sweet dessert Cherries, and should in time run the Morello, with its tart smack, out of the field. The general nursery stock, both out-of-doors and under glass, was abundant and healthy. Maréchal Niel Rose is grown in large numbers, and so well, that the stock is soon bought out. The same holds goods of Vines in pots. Of fruiting Vines, three houses are just now a splendid sight; these consist of Gros Maroc and Madresfield Court in one division, Mrs. Prince and Gros Colmar in another, Muscat of Alexandria in a third. The Vines, notwithstanding the continuous heavy cropping—50 lb. at least to a Vine—show no indications of falling vigour, the bunches and berries being as large and as well coloured as in any previous year. Nothing is done to the borders beyond forking them over once a year, and affording them a dressing of some artificial manure, and perhaps that little is not necessary, the roots being down in the good deep loam overlying the Greensand, the latter affording egress to the surface-water, and also supplying moisture at call to the upper crust.

## NEW OR NOTEWORTHY PLANTS.

### CYPRIPEDIUM CHELSEENSE $\times$ , n. *hyb.*

“I HAVE the pleasure of sending you herewith the flower and leaf of one of my seedling *Cypripediums* now blooming for the first time. As you will see, it is intermediate between the parents, *Cypripedium Loweii* and *Cypripedium barbatum purpureum*. Its habit and style of growth favouring *Cypripedium Loweii*, as also the flower-spike, which I have sent you entire. The leaf is an old one, but the young ones show somewhat the marmoration seen in those of *C. barbatum purpureum*.”

With these very apt remarks Mr. W. Bull has sent me a leaf, much resembling *Cypripedium Loweii*, and a fine two-flowered peduncle. The plant appears to be the inverted male of *Cypripedium calanthum*, a *Sedenian* work at Messrs. J. Veitch & Sons (1876).

That is a descendant from *Cypripedium venustum* biflorum and C. Loweii, while Mr. Bell's plant is derived from C. Loweii and *venustum purpureum*. The chief characteristic lies in the staminode. *Cypripedium calanthum* has that of C. *venustum*, while C. *chelseense* has that of C. Loweii. The colour of the flower is totally distinct. There is a very near ally of those two, *Cypripedium pycnoterum*, one of those Orchids whose parentage is not known. At all events its staminode gives it a full claim for distinction, and, excepting the petals, the whole flower is green. The plant is very beautiful. The leaf at hand is 1 foot long. The brown peduncle is very long, with a shortly hairy surface, and bears two flowers. The bracts are very short, spatheo-ancipitous, semi oblong, acute, greenish, with mauve-purple veins. The dorsal sepal is elliptic acute, with reddish veins. The inferior petal is covered with blackish-brown, the superior is yellowish-green. The petals are very shining, ligulate, broader towards the apex, bent in a revolute manner in the middle, blunt acute at the apex, dark purple on the anterior part, green at the superior part, with small blackish freckles, and ciliate at the superior margin. Lip nearly like that of *Cypripedium Loweii*, with strong lateral horns, brownish, with an inferior, ochre colored midline. Staminode cuneate dilate, as in *Cypripedium Loweii*, forcate at the apex, with a very small median apiculus, light red, with a dark green median tessellation. Dimensions of *Cypripedium Loweii*.

The lover of Orchid hybrids and the Cypripidists will receive this novelty with delight. *H. G. Rehb. f.*

*CYPRIPIEDUM POLYSTIGMATICUM* X (*VENUSTUM* SPICERIANUM), *hyb. Angl. Measures*.

Mr. R. Measures, of The Woodlands, Streatham, begins now to reap the fruits of his cypripidic efforts. Fresh hybrids are now growing in his houses. This one has leaves of the shape of those of *Cypripedium venustum*, lightest green—some with broken transverse stripes. The strong peduncle may become two-flowered. There is a prolongation of the axis next to the flowers. As it is broken off at the top I cannot ascertain more. The peduncle is brownish-red, with short hairs. The wide acute bract is open in a cup-like manner, green, with blackish-red stripes and lines of spots. It is nearly equal to one-third of the length of the ovary, which is very short, hairy, and of a much lighter colour than the peduncle. The dorsal sepal reminds me of *Cypripedium Spicerianum*, both by the shape and by the margins revolute from the middle to the base. The nerves are broad with ramifications of purple. They end in front of a white apical part. The inferior sepal is narrower, oblong apiculate, white, with a lightish ochre hue. Lines of brownish purple spots run over it, chiefly outside. Petals divaricate, ligulate, acute, revolved in the middle, green at the base, light reddish-brown from the superior mid to apex. A dark brownish-purple line runs over the centre vein. Similar spots occur under it, and numerous small blackish spots stand on the basilar green area. The large lip has strong lateral horns, and an almost rectilinear border round the mouth. The colour is light brownish-purple, with an ochre shade on the inferior median area. The staminode is quite transverse elliptic. It has a median, very obscure tooth in the middle of the front side, and a thicker and very short one on each side. The colour is light purple, with some green areoles in the centre.

There can be no doubt about the descent from *Cypripedium Spicerianum*. The leafspeaks of *Cypripedium venustum* or of one of its allies by the dark transverse bars. I cannot, however, account for those little blackish spots on the green base of the petals, which are suggestive of *Cypripedium hirsutissimum*. *H. G. Rehb. f.*

*CYPRIPIEDUM VARIOPICTUM* X (*LAURENCIANUM* SPICERIANUM), *n. hyb., Angl., Measures*.

This mule was raised by Mr. R. Measures, of The Woodlands, Streatham. It is a very effective novelty. The parentage is the same as that of *Cypripedium radiosum* X, *Rehb. f.*, Sept., 1883—*sed quantum dis-*

*tabat ab illo*! It is quite distinct in colour, having the petals of C. *polystigmaticum*, those of C. *radiosum* are green, washed on the borders with sepia. The lip is reddish-purple and ochre, while it is sepia-brown with a greenish border round the mouth in C. *radiosum*. The staminode is mauve with a white border in this plant, purple with a white centre and some green dendritic markings in the middle in C. *variopictum*. If an amateur ordered the one and obtained the other he might—and duly so—get exceedingly cross.

The leaves are shaped like those of *Cypripedium venustum*, in colour green with darker, often flexuose, margin. Peduncle thin, very long, dark purplish-brown. Bracts acuticulus, ligulate-acute, green, with blackish-purple lines and spots; it is altogether much shorter than the reddish-brown ovary. Dorsal sepal elliptic-acute, whitish-green at the base, with radiating veins. Lateral sepals shorter than the lip, whitish-ochre, very pale, with brown veins. Petals deflexed, ligulate-acute, with dark purple mid-line, superior yellowish, partly covered with dark spots; anterior part brownish-purple, superior margin very hairy. Lip light ochre, purple outline. Staminode transverse elliptical, the front having large lateral teeth, with minute central apiculus. The centre is white, with green dendritic marks; sides purple. *H. G. Rehb. f.*

*CYPRIPIEDUM SAYAGANUM, n. hyb.*

A plant of this exceedingly pretty and compact-growing variety, the result of crossing *Cypripedium Harrisonianum* with C. *Spicerianum*, is now in bloom at Messrs. Seeger & Tropp's nursery, Lordship Lane, S.E. The foliage is veined, as in C. *Harrisonianum*, but the leaves are much shorter and the veining closer. The dorsal sepal of the flower is in form much as in C. *Harrisonianum*, one-third of the outer surface being snow-white, within which is a rose-coloured area, the base being emerald-green, the dark line running up the centre is as in C. *Spicerianum*. The petals and pouch are in form near to those organs in C. *Spicerianum*, the petals tinged with rose and having a dark and well defined line up the middle of each. It is a charming flower, and is named in honour of the grower of Mr. Kimball's noted collection at New York. The opposite cross resulted in C. *Seegerianum*, in which, in the resemblance to the parents the features are the opposite to C. *Sayaganum*. *J. O'B.*

*CROCOSMA AUREA* VAR. *MACULATA, Baker.*

This is a fine variety of *Crococoma aurea*, Planchon (*Tritonia aurea*, Pappe), which for garden purposes is well worth distinguishing from the original type as figured *Bot. Mag.*, t. 4335. The bright orange-yellow oblanceolate-unguiculate perianth-segments are above 1 inch long, so that the deflexed expanded limb is  $2\frac{1}{2}$  inches in diameter, and the three inner segments have a blotch of red-brown at the top of the concave claw. The stamens and style are as long as the segments of the perianth. We are indebted for a fine living specimen to Mr. James O'Brien, of Harrow-on-the-Hill. He is not certain as to the exact locality where it was found wild, but thinks it is inland from Algoa Bay. The species has a wide range, as it has been gathered during the last few years on the mountains of East Tropical Africa within 6° of the equator. The Mozambique, *Crococoma mossambicensis* of Klotzsch, is a mere form of the same species. *J. G. Baker.*

## THE BULB GARDEN.

### FREESIAS FROM SEED.

THESE lovely Cape flowers deserve to be grown more extensively than they are. Hitherto the high prices of bulbs have been a great drawback; but at the present time they are within the reach of every one, and can be bought for 1s. per dozen, and much cheaper in larger quantities. About four years ago a friend of mine bought 500, for which he paid £7 10s. A pint measure would have held

the whole of the bulbs. They may be had in bloom from bulbs, and bud nearly the whole year round. Few flowers are more accommodating to the skill and attention of the cultivator, nor are they particular as regards soil—only moderately good free soil will suit them. Bulbs planted in August will, if kept in a warm house, give flowers for Christmas, and a succession of planting will give a succession of blooming. Plants from seed sown in March will bloom the following autumn. I have a bed now in bloom, the seeds of which were sown in the open ground, just as I should have sown Radish seed, the first week in April. They have had no more care than a bed of hardy annuals, not a sheet of glass, nor even a drop of water from the watering can. They have not been moved from the seed-bed. I pulled up one of the blooming plants to examine the bulb, when I found that it was not larger than a Radish seed, but there was a long tap-root. The bulbs increase very rapidly, not only round the base of the parent bulb, but from two or three joints of the blooming stem; they are also good seed bearers. *J. C. Tomkin, Isles of Scilly.*

## A MYCOLOGICAL EXCURSION IN SWEDEN.

THE desire to visit Sweden, the country of the illustrious Fries, is common to all mycologists whose enthusiasm in the pursuit of their favourite study is sufficient to render them worthy of the name. It has been the privilege of the writer during the present autumn to accomplish this wish. As most British mycologists are readers of the *Gardeners' Chronicle* a short account of the excursion will probably be of interest. My object in visiting Sweden was, not so much to find new or rare species of the Hymenomyces as to clear up, if possible, certain difficulties which for many years past have troubled me with regard to several of the commoner species. These difficulties have increased rather than diminished during the past twenty years, in spite of frequent communications with almost all, if not all, our leading mycologists, either personally or by letter, and of visiting every year one or more of our annual fungus forays. I wish to speak for no one but myself; others who have entered upon the study more recently may have been much more successful—to them the Cortinari present no difficulties, the Russulae are simple, and the Lactarii abundantly distinct.

With this object in view I sought to find some mycologist in Sweden who had been personally acquainted with the views of Fries, who had botanised with him, and who knew from actual contact with him his opinions of the species as they occurred in the field. For this purpose no one was, I knew, more able to render me help than his son, Dr. Robert Fries, of Gottenburg, who had not only for many years worked in the field with his father, but who also had been his coadjutor in the *Hymenomyces Europaei* and in the *Icones Selectae Hymenomycetum*. In Dr. Fries I may at once say I found one not only able, but willing, to help. Arriving at Gottenburg on a Monday evening, having secured a good room at the hotel with plenty of light and abundance of table-room I was ready for business. The Swedes are early people, so a preliminary run round the Botanic Garden before breakfast next morning was made; this gave evidence that fungi were to be found, *A. cristatus* and *A. carneus* being abundant on the lawns. Later in the morning Slottsskogen was visited. This is a place of public resort near Gottenburg, a sort of half park, half garden. It was too late in the year for most of the flowering plants, but *Hieracium umbellatum* and *Silene rupestris* were in full blossom. The rocks were covered with lichens, among which *Umbilicaria pustulata* was very conspicuous. Of fungi, *A. fastigiatus*, *Russula integra*, *fellea*, *Lactarius cemicarius*, and *Marsium scorodionis* were gathered. A large bush of *Ribes aureum* was literally covered with *Cronartium ribicola*, one of the *Uredinea* which has not yet crossed the silver streak, although it is abundantly common on

the Continent. Later in the day an excursion was made with Dr. Fries to the Pine forest at Floda. Here mycological treasures came in thick and fast. *Agaricus porphyrius*, *inamemus*, *rosellus*, *zephyrus*, *acervatus*, *astragalinus*, *picreus*, *decorus*, *acerosus*, *Cortinarius traganus*, *limoniis*, *malicorius*, *cinnamomeus* and its variety *semi-sanguineus*, *cinnabarinus*, *sanguineus*, *gentilis*, *malachius*, *Hygrophorus caprinus*, *agathosmus*; *Russula integra*, *Polyporus borealis*, *pinicola*, *Hydnum cyathiforme*, *Rhizopogon luteolus*, and *Helvelia infula*!

Of all these, perhaps, the one which interested me most was *Russula integra*, for I was able to learn the views of Elias Fries with regard to this species. In response to my queries respecting it, Dr. Fries replied, "My father said with regard to *integra*, that—No, my courage fails me; I dare not say what Dr. Fries told me, for some of our English mycologists may have preconceived notions as to what *R. integra* ought to be, and would handle me as roughly as they did last year over *Agaricus russula* and *Hygrophorus erubescens*. For my own part, I should not mind this, but I should not like to see the name of the illustrious Fries dragged through the dirt. At Floda were growing *Calla palustris*, *Goodyera repens*, and *Monotropa hypopitys*, all of them in flower. We also found *Clavaria apiculata* on a Fir stump—a fungus which must surely be British. Such a number of species took most of the next day to examine and sketch, but in the afternoon time was found to visit Rja Skog. Here *A. campanulatus*, *asprellus*, *vitilis*, *escharodes*, and *euchrous* were found. I was taken to an Oak tree, the habitat of *Trametes serpens*. Only one specimen was visible, and that just out of reach. However, it was secured by the assistance of Master Harrold Fries, who, by an acrobatic manoeuvre, succeeded in prising it off with a knife while he stood upon my shoulders. On the following day I took train alone to Jonsder. This little station stands on the margin of a fine lake (Sjon Aspen) surrounded by a forest of Pines. For five hours I wandered in absolute solitude as far as humanity was concerned. A small stream falling into the lake led me through the Pine forest to a charming little lake with Water Lilies upon it—Råfsejon (the Fox's Lake). The forest, with its undergrowth of *Vaccinium vitis idæa*, and *Myrtillus*, mixed with stunted Juniper and *Empetrum*, recalled at every turn our own *Rothiemurchus*, while a large heap of sawdust, with *Lindbladia effusa*, and its accompanying *Stilbum*, served only to heighten the similarity. It was only when here and there a patch of *Cornus suecica*, with its scarlet berries intervened, that one realised the fact of being in Sweden, and not in Scotland. An overflowing vasculum was the result of the morning's walk. The species gathered (which were afterwards examined by Dr. Fries) included *Agaricus flavo-brunneus*, *vaccinus*, *imbricatus*, *strobilinus*, *ptigerinus*, *dryophyllus calamistratus*, *Cortinarius anfractus*, *malachius*, *paleaceus*, *helvolus*, *brunneus*, *anomalous*, *bolaris*, *pholidus*, *limoneus*; *Lactarius ruber*, *viduus*; *Marasmius perforans*, *Polyporus nigricans*, and *radiatus*.

The next day an excursion was made to Torp, where I was highly gratified by making the acquaintance of the true Friesian *Cortinarius triumphans*, a fungus which has often been discussed at Hereford. Of equal interest was it to gather *Lactarius helvus*, which is common enough with us in England, and probably in Scotland, although we have mistaken it for an allied species. *Agaricus pessundatus* also was found, which naturally led to a long conversation on the relative merits of *A. imbricatus*, *flavo-brunneus*, *albo-brunneus*, *vaccinus*, and *ustulalis*. *A. sindonius*, *euthelus*, *columbetta*, and *albus*, were also found, as well as *Cortinarius varicolor*, *evernius*, *armenicus*, and *Boletus cyanescens*. On the following day Floda was again visited, when *Agaricus iterinus* was found growing abundantly in a Potato field. *A. caperatus*, *inopus*, *flammanus*, that "noble species," *A. depilatus*, and magnificent specimens of the exquisite *A. decorus* were gathered.

Of course, during our rambles that mystic trio, *Lactarius quietus*, *subulcis*, and *serifinus*, were men-

tioned, and I was glad to get the views of Dr. Fries on them; but what the views of his illustrious father were upon these three species I dare not say. Lastly, I had the opportunity of submitting to Dr. Fries a specimen of *Agaricus lacrymabundus*, which appears in our flora under another name. What that name is, I must leave my mycological brethren to find out. I dare not tell them, lest Dr. Fries and I should be subjected to a worse flagellation than I received last year over the green gills of *Russula delica*. Personally I could bear even this, for I am not above learning from Teuton or Gaul, Scot or Swede, Dane or Dutchman, but I do not wish to subject any one else to the vials of wrath of those who try to stem the onward march of truth. *Charles B. Plowright.*

## A NEW PALM.

On April 19, 1886, in company with Mr. C. E. Faxon, Mr. A. H. Curtiss, and Lieut. Hubbard, of the United States Navy, I landed from the Light-house tender *Laurel* near the eastern end of Elliott's Key, one of the larger of the Florida Reef Keys, at the house and Pine-apple plantation of Mr. Henry Filer.

Our attention was at once directed to a solitary plant of a small pinnate-leaved Palm, left standing in the clearing, which, at first sight, was mistaken for an *Oreodoxa*, but the large orange-scarlet fruit at once showed that we had stumbled upon a tree unknown before in the North American flora, and quite unlike any of the species of *Palms* known to us. Specimens of the fruit, which was not, unfortunately, fully ripe, were sent to Dr. Wendland, of Hanover, who provisionally pronounced our Palm to be the representative of a new genus, for which he proposed the name of *Pseudophoenix*. A short account of this discovery, with the announcement of Dr. Wendland's new genus, but without characters, was published in the issue of the *Botanical Gazette* for November, 1886, but it was not until a year later that I received through Mr. Curtiss ripe seed of the *Pseudophoenix*, which was sent to Dr. Wendland, who has drawn up from it generic characters.\*

*Pseudophoenix Sargentii* is a slender, low tree, 20–25 feet high, with a trunk 10–12 inches in diameter, and abruptly pinnate leaves 4 or 5 feet long, the pinnae lanceolate-acuminate, 12–16 inches long, bright green above and glaucous on the lower surface. The branching spadix appears from among the leaves; it is (in the only specimen seen by me) 36 inches long by 30 inches broad, the main and secondary branches light yellow-green, flattened, and the latter thickened at the base, especially on the upper side, into an ear-like process. The three-lobed fruit, often one or two-lobed by abortion, is a half to three-quarters of an inch in diameter, bright orange-scarlet, and very showy. Only the withered remnants of the flowers have been collected.

A few individuals were discovered scattered through the woods in the neighbourhood of Mr. Filer's plantation, and late in the year a grove of them was discovered near the east end of Long's Key by a gentleman from Bay Biscayne, whose name I cannot recall. There were about 200 plants, large and small, in this grove, at the time of our visit to Long's Key in the spring of 1887. These are the only stations where *Pseudophoenix* is now known, but as the flora of the Florida Reefs Key is Bahaman in its constitution, and probably in its origin, it would be a singular fact if this tree was not found in the

Bahama group, the plants of which are still very imperfectly known. *C. S. S., in "Garden and Forest."* [The Palm here alluded to was named in honour of Prof. Sargent, the Director of the Arnold Arboretum, Brooklyn, Mass., and Editor of the excellent publication whence our article was taken. Our illustration (fig. 56), was copied from a photograph in the Museum at Kew. Ed.]

## NOTES ON HARDY PLANTS.

Among the first of these to cross the memory is that charming alpine, *Arnebia echioides*, which year by year demonstrates its wonderful profuse blooming propensities. On September 26 it was as finely in flower as one is wont to see it in springtime; and to be able to remark this of so valuable a plant, can only make it still more valuable. It is also worthy of note that its flowering so late is not a mere accident, or occasioned in any way by the remarkable season through which we have passed, for I well remember that when I first made the acquaintance of this gem (nearly nine years ago), it was in full flower in the end of September. There are few plants among the whole army of hardy subjects around which so much interest is centred as in this; while from a decorative point of view it is quite unique. The flowers on first expanding are of a clear canary-yellow, having fine dark spots on each flower; these gradually deepen in colour till nearly black, when a change takes place and the flowers assume a pale straw colour, the spots disappearing at the same time. It is a plant that can safely be recommended to all by reason of its sterling worth, for anyone may grow it perfectly in a rich light fibrous loam, and it is perfectly hardy. When full grown and established it is not more than 18 inches high, consequently is well suited for the rockery or the front row in the border among good things. Its methods of propagation are by division, by seeds, and by root cutting. The first named is best carried out in early spring, and the last in winter-time, when the plants are the least active, detaching the thicker portions of roots, and cutting into lengths of 1 inch or more and placing in gentle heat. Seeds are produced rather sparsely in some seasons, but in others a fair crop may be secured; in either case sow as soon as ripe in very sandy soil. Small groups of this have a marvellous effect when in flower, and I cannot too strongly urge all who have it to endeavour to increase it by all means in their power. It is destined to become one of the most popular of hardy plants, and when sufficiently plentiful, will make a grand plant for spring bedding. Since its introduction the demand has more than equalled the supply, for its cultivation and propagation were not so readily understood as now, so that we may soon expect to hear of it in abundance (see our figure, vol. xxi., 1879, p. 689).

*Hellebores*.—A seasonal reminder with respect to those of the niger section may prove of service. The majority of hardy plants are usually transplanted directly after flowering, and experience has proved this a very satisfactory course to pursue. With the *Hellebores* or Christmas Roses it is not so; particularly is this the case on certain soils—e.g., light sandy or gravelly soils. If any one having plants of these will take the trouble to examine them just now, they will find quantities of large fleshy roots emerging from the base of the newly formed crowns; therefore I consider that if the planting is done just prior to those roots being emitted, you are going a long way towards giving your plant a fair start: and a good start with many things besides *Hellebores* is the secret of success. This season, consequently, doubtless, on the great rainfall which has been so generally felt, this basal root-action is much earlier than usual; and I was surprised to find a few days ago in the varieties major and maximus, new roots fully 8 inches long; last year at the same date the new roots were just issuing from the crowns, thus illustrating the necessity of earlier planting in seasons like the present. Where large clumps exist, and it is desired to increase the stock,

\* *Pseudophoenix*, nov. gen., Herm. Wendl.—Gaussia affinis. Fructus stipitatus drupaceus cernisformis auriculatus, e carpellis 1–3 globosis, stigmatibus residuis basilariis vel in fructibus lobatis lateralibus centralibus, epicarpio coriaceo, mesocarpio gummoso, endocarpio tenuiter vitreo-crustaceo. Semen liberum subglobosum erectum, hilo basilari, raphe ascendente utrinque ramis, 2–3 manifestis curvatis, albumine equisili; embryo basilari. Fl. fem. in fructu; calyx parvus pateriformis leviter 3-dentatus. Petala 3 cordata obtusa, viridia refracta. Stamina 6d 6 manifestia apice atropurpurea.

—Palma medicioris, erecta, foliis pinnatisectis, segmentis duriusculis ima basi valde replicatis. Species 1. *P. Sargentii*, Herm. Wendl. Elliott's Key, Florida.

and retain all flowers possible at the same time, I would advise transplanting a portion of the stock annually, early or late in September, according to the season, till a sufficient quantity was procured.

*Lilies.*—For the great majority of Lilies the present season will be found excellent for making fresh plantings; those of the candidum section should have been planted some weeks ago, but for those even of this section that have been dried for importation it is not too late, though to delay it will not improve matters. All those which belong to the longiflorum, tigrinum, speciosum, pardalinum, auratum, and such groups, could not be

ginalae, and the crimson-banded rubro-vittatum; all these are grand, and when established have no equals among the many gems of which this gorgeous genus is composed; particularly fine have been the spotless forms of virginale and the gaily-coloured rubro-vittatum this season, while of platyphyllum it may be said that we have no nobler or grander Lily extant. J.

### THE GENUS PRIMULA.

A few reasonable cultural remarks may be useful at this time, when the old collection requires overhauling, and a few repotting, before the cold weather

not very successful in cultivating these Primulas, especially some of the smaller species, natives of the European Alps. They do fairly well for a few years after being imported, but gradually degenerate, and in time fail to flower, when they are not worth looking after.

I have tried various compounds of soil in which to grow the whole of the Alpine and Himalaya species of Primula, and find that loam with a little leaf-mould and decayed manure is not sufficiently open; it does very well for a time, but by-and-bye the mass hardens, and the finer hair-like roots perish. I add to the loam about a third part of

FIG. 56.—PSEUDOPHOENIX SARGENTII: A NEW PALM FROM FLORIDA. (SEE P. 408.)

taken in hand at a better time, and among these may be included Szovitzianum, chalconicum pyrenaicum, and many more. For such as Harrisii the best results are obtained when pot-culture is resorted to, and the plants afforded the protection of a house or warm frame or pit. Few plants, perhaps, more quickly resent the use of crude manures than Liliums, and they should never be used; when manure is used at all let it be thoroughly decomposed; in this state the varieties of L. speciosum and longiflorum are benefited by its use; pardalinum, californicum, and superbum, delight in moist sandy peat—in fact, these will endure a considerable amount of moisture at the root, and revel in full sunlight overhead. A light very sandy loam, or loam and peat in equal parts, seems to suit the varieties of auratum, such as platyphyllum, vir-

sets in. I seldom have time to do much to our plants from the time the largest proportion of them go out of bloom in April and May. At that time the plants are placed in a partially shaded position out-of-doors; and they do not require very much attention through the summer months. All that they get is to supply them with water when it is required, and to keep the pots free from weeds. Their natural requirements suggest a free exposure to light and air; ours have sufficient air, as we leave the plants fully exposed out-of-doors up to the beginning of November, when they are placed in glass frames, and they get all the light possible without exposing them to the direct rays of the sun. Even now, when the plants are being repotted, they are again placed in the same position out-of-doors. Many persons are

brown fibrous peat and this is quite sufficient to keep the compost open for twelve months. Broken pieces of limestone rock are excellent for the smaller-growing European species. In some instances, the small species, such as P. Allionii, P. minima, P. Muretiana, &c., do well planted close to a piece of rock projecting from the surface of the soil in the pot or pan in which the plants are placed. A single plant of any of these is too small to occupy a pot by itself. A dozen plants might be put out in a 4 or 5-inch pot.

I find the Auricula aphid attacks nearly the whole of the Primula family; and the smaller alpine species seem to be held in special favour by these troublesome parasites, which cluster thickly amongst the small fibrous roots close to the surface; and it really

does more mischief to the plants to try to wash it off the roots, than the insect itself does if it is left alone. Some varieties of the *Auricula* are attacked by green-fly; others by the red-spider; both can be destroyed by dipping the leaves in a solution of tobacco-water and soft-soap. Use 2 oz. of soft-soap to a gallon of rain-water, and add to each gallon a wineglassful of tobacco liquor.

We have these *Primulas* in flower all the year round now; as some of them flower very early in the year, and others later through the spring and summer months. I fancy there is a great field for the hybridist in the genus *Primula*, and even if no pains are taken to hybridise the seedlings raised from certain species and sub-species they vary considerably from the parent stock; and, further, it is absolutely necessary that seedlings should be raised from some of the species at least biennially; as not only do young plants produce the strongest flower-spikes, but in some cases the old plants have a tendency to die out altogether. The following are a few of the best species and varieties to cultivate to produce a succession of bloom.

*Primula villosa* is one of the oldest cultivated species; and many improved forms of it are in cultivation, which have been produced by natural selection. The true alpine plant was figured in the first volume of the *Botanical Magazine*, t. 14; but previous to this (1787), the white form of it, *P. villosa nivea*, had been cultivated in this country. A specimen of it was obtained and figured later, t. 1161. Even at that time it was grown under the name of *P. nivalis*; but Dr. Sims, the then Editor, pointed out that the plant figured was merely a variety of *P. villosa*, and that the *P. nivalis* of Pallas and Willdenow was the *P. longifolia* of Curtis, figured in *Bot. Mag.*, t. 392. This plant had been sent from Paris to Messrs. Grimwood & Co., nurserymen, Kensington, and the Editor says:—"We have found it very liable to be injured by the aphid plant-louse or blighter." Is this the first notice of the *Trama Auriculæ*? Something like forty species of *Primula* have been figured in the *Botanical Magazine*, nine of them during the last four or five years. The species *P. villosa* is the most useful of all for garden culture if we except the parents of the show *Auriculas*, *P. auricula* and of the alpine, *P. pubescens*. This last species Mr. Baker informs us was introduced into cultivation 200 years ago, by Clusius, as stated in the report of the *Primula Conference*. This ought to read 300 years ago, as we read further on that, "about 1882 Clusius sent from Vienna, to his friend Van der Delft, specimens of *P. auricula* and *P. pubescens*."

*P. marginata* is another species which has been in cultivation in England for more than a century. I obtained from Messrs. Backhouse, of York, many years ago, two distinct forms of it, named *P. marginata grandiflora* and *P. m. corulea*. They are both distinct, and superior to that grown usually as *P. marginata*. It was named by Curtis, and figured in the *Bot. Mag.*, t. 191, and it is stated that it was "received from the Alps in 1761, and has continued in our gardens since unaltered by culture." This it probably would do if no seedlings were raised from it; but I find the seedlings vary considerably, especially in the form of the leaves and density of the marginal farina. It is an easily cultivated species; small plants soon grow into handsome specimens. It does well out-of-doors, on the rock garden, or as a pot plant. The large masses of it in Messrs. Backhouse's rock garden at York have a striking effect when in flower.

Interesting garden plants, too, are the forms of the ordinary garden *Auricula*, found wild in the mountainous districts of Southern Europe. The original plant, pure and simple, has mealed foliage and small trusses of yellow flowers, with a small mealed centre. The variety *Balsilis* is a neater plant, with brighter coloured flowers, but it is not so free in growth. *P. Obriistii* (Stein) is just another form of *P. Auricula*. There is also a pretty little variety of it we have grown for some years under the name of *marginata*. *P. Allionii* of the Mari-

time Alps is one of the most desirable of the small growing species; its flowers are large for the size of the plants. *P. spectabilis* is a useful species, both for growing in pots and planting out in the rock garden; it grows very vigorously, and forms a handsome tuft. The little *P. minima* we always grow, and it sometimes produces its pretty rosy-tinted flowers on the smallest possible plants.

We grow all we can obtain of the Indian *Primroses*. They seem to differ very much more in habit and constitution from each other than the European species do. This may be observed even in the matter of roots. The hardy free-growing *P. rosea* has quite a mass of fibrous roots clustering round the base of the crown, with scarcely any root-stock; while *P. capitata* sends down a Carrot-like root, with a few lateral fibres diverging from it.

One of the earliest introduced Indian *Primulas* is *P. denticulata*. It was first described by Sir James Smith in *Exotic Botany*. It is also figured in the *Botanical Magazine*, from a specimen flowered by Mr. Veitch in March, 1842. The *Primulas* grown as *casmiriana* and *pulcherrima* are merely varieties of this. It grows well in pots, and establishes itself freely in partially shaded places out-of-doors. Sometimes it is grown under the name of *P. purpurea*, but this is a different plant altogether, and is a variety of *P. Stuartii*; we have it in cultivation, but the plant, though a strong one, has not yet made any attempt to flower. The true *purpurea* of Royle has flowered with the Rev. C. Wolley Dod at Malpas, and was figured in the *Gardeners' P. Stuartii* I have not seen, but the foliage resembles Royle's plant as it is figured in the *Botanical Magazine*; the colour is primrose, and the flowers well formed. Royle found *Stuartii* also at an elevation of 9000 feet, and says it gave a rich yellow glow to those regions. It flowered in the Edinburgh Botanic Gardens in the summer of 1847.

*P. rosea* is one of the most desirable of the Indian *Primulas* to cultivate; it grows anywhere, but likes to have the roots always wet. This species might soon be greatly improved by selecting only the very best varieties to save seeds from. It can hold its own with the grass and weeds at the edge of a pond, and is the best *Primula* of this type for semi-wild places. The *Auricula* aphid is a pest to it in pots, but when aphid-infested plants have been put out-of-doors the insect disappears. The lovely deep rose flowers are charming in early spring. *P. prolifera*, with a spike of yellow flowers like *P. japonica*, is not worth growing, except by those who want a complete collection. The best of the recent Indian species are *P. obtusifolia*, with a deep claret-coloured flowers and a yellow eye; *P. Reidii*, with ivory-white flowers. The first-named is a vigorous growing plant, and will, I fancy, succeed as well out-of-doors as *P. denticulata*; it is very correctly figured in the *Botanical Magazine*, t. 6956. It is there stated that a dried specimen in the Kew Herbarium has yellow flowers. This was collected by Dr. Watt, and he also in a manuscript note, gives yellow as the colour of the flower. Royle represents it with a long corolla tube, and the colour of the flowers lilac. Our plants were raised from seeds sent by Dr. King, and have all deep claret or rich purple flowers. *P. Reidii* is quite a distinct and peculiar species. The seeds are very small indeed, the young plants are also remarkably small and move very slowly at first, nor does it seem as if it would make a large plant. I will try both this and *P. obtusifolia* planted out. Mr. Duthie discovered the plant in 1884 on wet rocks in the Ralam valley of the Western Himalayas, near the glacier, at an elevation of 12,000 to 13,000 feet. *P. japonica* should be grown everywhere in the wild garden. A large mass of it in the wood at Kew was a striking sight in its season of bloom.

The vigorous growing *P. sikkimensis* seems to do well out-of-doors, and is distinct and very beautiful; its drooping primrose flowers are very sweet. *Primula Parryi*, a Rocky Mountain species, I cannot praise very highly. I have large plants of it growing in the open garden and in pots, but none of them have

produced trusses anything like the figure in *Bot. Mag.*, t. 6185. It is certainly a very distinct species, but as it does not flower until the end of May, or, as it did this year, in June, it has to compete as a decorative subject with more showy plants. It seems to grow near the snow line of the Colorado district, and flowers in July so plentifully that "it gives the name of Primrose Creek to one of the affluents of the Colorado River." It does well out-of-doors in heavy soil on the edge of a small pond. Jas. Douglas.

## ORCHID NOTES AND GLEANINGS.

### ORCHIDS AT ALLERTON BEECHES.

Quirs recently an opportunity afforded me the pleasure of paying a visit to the garden owned by H. Tate, Esq., an enthusiastic horticulturist, which is situated in Allerton, a delightful suburb of Liverpool. The principal feature of the establishment is the collection of Orchids, which the owner is fast increasing to a rich and extensive one. All were in the best possible condition, and do great credit to Mr. Edwards, the gardener. Just now interest centres in the beautiful *Cattleya Hardyana*, a supposed natural hybrid, supposed to have sprung from *C. aurea* and *C. gigas*. I had an opportunity of comparing a flower from the original plant belonging to G. Hardy, Esq., of Pickering Lodge, Timperley, a figure of which is given in Williams' *Orchid Album*, vol. v., plate 231, and of the two the former is an improvement in regard to size of the flower and the depth of its colour. The plant in question was purchased with others as *C. aurea* from Mr. Sander, St. Albans, and judging from other plants that are pushing flowers through their sheaths, it appears probable that Mr. Tate will be the fortunate possessor of more than one example of this fine species of *Cattleya*. In the same house as the above a very fine form of *C. gigas Sanderiana* was observed. The *Cattleyas* generally are very vigorous and compact, with numerous sheaths, a good number of which, especially the Mendelii section, are as yet unflowered, and, judging from the characteristics observed in pseudobulb and leaf, a rich harvest of blooms in great variety may be expected. A fine plant of *C. Trianae* *nivea* of Backhouse, and *C. Trianae* *Victorie*, are sheathing up well, as also *C. Skinneri* *alba* and other excellent forms too numerous to be mentioned. Two well-flowered plants of *Laelia Dayana* and a very fine form of *L. elegans* were attractive. Amongst other *Laelias* with bloom or coming forward were well-grown specimens of *Perrinii*, *cinnabarina*, *albida*, *autumnalis*. Some fine plants of *L. anceps* *morada* of the Liverpool Horticultural Company were pushing sturdy spikes. This variety is reputed to be darker in shade than the well known variety, *L. Barkeriana*. *L. anceps* *alba* is well done by Mr. Edwards, the newly-made pseudobulbs being very fine, and will, in due time, afford a fine display of flowers. Amongst *Odontoglossums* a fine *O. crispum* var. *gutatum* was noticed in flower. Amongst a group of the favourite *O. grande* some very dark forms likewise. *O. Haryana*, just over, is said to be one of the darkest forms as yet flowered in this country; the plant is in superb condition, as were all the plants grown of this favourite genus. In the warm house a well flowered plant of *Vanda Sanderiana* presented a remarkable sight, and profusely flowered examples of *Oncidium Jonesianum* were observed. The *Phalenopsis* were very striking examples, with some strong spikes pushing up. *Cypripedium Ashburntoniae*, *canthium superbum* (off the original plant from the late Mrs. Morgan's collection), *Harrisianum*, *insigne*, and its var. *violaceum punctatissimum*, with twenty spikes; *villosum Spicerianum*, *Sedeni*, and others were in flower. I may add, in conclusion, that Mr. Edwards is busy hybridising, and that most of the crosses effected (which have flowered) denote the employment for this purpose of the finest forms; therefore it is only reasonable to

expect some valuable results in course of time. *F. Ashton.*

#### PHAIUS BICOLOR.

Flowering, as this species does, from July to October—a time of year when Orchid flowers are least plentiful—and possessing all the good qualities of *P. grandifolius*, both as to easiness in culture and freedom of flowering, it is strange that it does not become more widely cultivated than it is. It was figured in 1844 in the *Botanical Magazine*, and plants have flowered annually at Kew for many years. It is similar to *P. grandifolius* in habit, the leaves being more lanceolate, and of somewhat stiffer texture. The flowers also are similar in character, being produced on long erect spikes, and measuring 4 inches across. In colour, however, they are quite distinct; the sepals and petals are of a bright reddish-brown colour; the side-lobes of the lip are rose-coloured and folded over the column, and the broad front lobe is yellowish-white, flushed with rose.

This Orchid comes from Ceylon, whence it was introduced in 1837; it requires intermediate temperature, and, being terrestrial, should be grown in pots in a compost of fibry loam, leaf-mould, and charcoal. During active growth it may be watered once a week with manure-water, this treatment conducing greatly to strength, both in foliage and flower. Through the winter months it should be kept rather dry at the roots.

#### LÆLIA PURPURATA.

An important item in the cultivation of *Lælia purpurata* is abundance of light, in order to enable the plant to produce robust and well-matured bulbs, without which it will not flower freely. When the growing season is over, the season of growth of this species commences, and if the plants are not carefully attended to failure will creep in. This is the best time to re-pot should it be required, but do not over-pot, as this is dangerous unless the plants are carefully watered, tending to cause a greater quantity of wet soil to lie about them. The plant should be well elevated above the pot in order to allow the roots to spread. The great secret of success in the management of this species is to induce the plant to produce strong roots outside as well as inside the pot. A slight syringing over the roots in the summer months in the afternoon, just as the house is closed, will be found highly beneficial. Slight shade is necessary during the hottest part of the day, but this should not be allowed to cover them at any time when the sun is not shining; indeed, the plants should be subjected to the influence of the sun's rays at all times when not powerful enough to injure the leaves. Thorough drainage is essential to these plants, and the best potting material is good fibrous peat from which all the fine particles have been well shaken; to this add some living sphagnum moss. *B. S. W., in "Orchid Album," September.*

#### ODONTOGLOSSUM VEXILLARIUM ROSEUM.

We have frequently pointed out the fact that this species of *Odontoglossum* requires somewhat different treatment from the majority of the other kinds. It is free in growth, but requires to be constantly watched, in order to prevent the thrips gaining a lodgment in the sheathing portion of the leaves, or these insects speedily cause the leaves to become spotted, or turn black, which by no means improves the appearance of the plants. This species will amply repay any extra care bestowed upon it, as the stronger the growths the greater the amount of blossom; and when the plants are vigorous, they not only produce flowers of larger size and deeper colour, but they remain in perfection a greater length of time. Mr. Vincent grows them in a temperature slightly lower than is given to the Cattleyas; we grow them on one side of the house in which our Cattleyas and other flowering Orchids are arranged. The *Odontoglossums* are placed on one side by themselves, so that as much water as they require can be readily given. These plants should be kept moist at the roots at all seasons, as they require little or no rest, and should never be allowed to get dry; but, as

a matter of course, very much less water is necessary during the dull months of winter. This species requires to be shaded from the strongest sun in summer; but it should be fairly exposed to the light, and, therefore, succeeds best when grown near the glass. Pot cultivation suits it well if the pots are well drained, and the potting material should be good fibrous peat and sphagnum moss. Care must be taken to maintain the soil in perfect order, as we find the plants rapidly melt away if any stagnant material is left about them. The re-potting should be done immediately after the flowering season, which will be just as they begin to make new growth, bearing in mind to keep the bulbs well above the soil. "*Orchid Album," September.*

#### ONCIDIUM INTERMEDIUM

is a distinct and beautiful evergreen plant, compact in growth, producing light green, fleshy leaves, a foot or more in height; the spike is erect, and attains to about 18 inches in length, and bears a much-branched raceme of showy flowers, which are very numerous. The sepals and petals are yellow, distinctly spotted and barred with chestnut-brown. It blooms during the months of May and June, and continues in full beauty for several weeks.

This species requires the heat of the Cattleya-house, and thrives best when placed in a position to obtain all the sun and light possible, just giving it sufficient shade to prevent its leaves burning. Treated in this manner it will be found to grow and flower most freely, and doubtless many other *Oncidiiums* would thrive better under the same conditions than they do at present, as many species grow naturally in exposed situations.

We find *O. intermedium* thrives well in a basket suspended from the roof, and near the glass; the baskets should be well drained, and the most suitable potting material is a mixture of good peat fibre, living sphagnum moss, and a considerable quantity of nodules of charcoal, in different sizes, mixed with it. This mixture will enable the roots to easily penetrate it, and throw out their tender points to absorb the moisture, with which the atmosphere should be well charged in the growing season. When growth is completed the plants must not be entirely dried, as they have but very small bulbs to support any great drought; but the water supply should be considerably diminished, and the plant kept in just that happy medium which prevents shrivelling, but does not force it into growth prematurely. "*Orchid Album," September.*

#### BRASSIA KEILIANA TRISTIS.

This *Brassia* will thrive equally well in either pot or basket, and enjoys the temperature of the intermediate house. It grows freely, and blooms profusely if properly attended to during its season of active growth, and accorded a fair season of rest, without being subjected to a too severe drying. The pots should be well drained, and the potting material should be good peat fibre with the addition of some living sphagnum moss. The plant should be well elevated above the rim of the pot, upon a cone-like mound, for, as they enjoy copious waterings during the growing season, this system causes the water to pass away rapidly, and thus stagnation is avoided. If grown in baskets the same material should be used as before recommended, and the basket or baskets suspended from the roof near the glass, in order to afford the plants an abundance of light. They require, however, to be shaded from the hottest sun. These plants grow naturally in somewhat shady places, so that if fully exposed under glass to the sun's influence, the foliage soon becomes yellow and permanently disfigured.

The best time for re-potting, if the plants require it, is just as they begin to start into fresh growth, using every care to avoid injuring the young roots, and any roots which have been covered should not be exposed, as the change often proves injurious. In the resting season much less water will be necessary, but never allow the bulbs to shrivel.

If required, these plants may be increased by

dividing the bulbs at the time of re-potting; one or two old bulbs should be left with each leading shoot, these divisions being put into small pots at first, and they should be kept in a somewhat cool place until established. "*Orchid Album," September.*

## PLANT NOTES.

### PUYA LANUGINOSA.

A LARGE plant of this is now in flower in the Succulent-house at Kew, and, according to Mr. Baker, this is the first time this species has flowered in cultivation. It has a stout stem and recurved, toothed, silvery-green leaves, suggestive of *P. chilensis*, but smaller. The flower-spike is stout, 1½ inch in diameter and 3 feet high, the topmost foot being clothed with flowers and buds, all literally packed together. The calyx is roundish, about the size of a Hazel-nut, and covered with a dense coat of brown woolly hairs; the corolla is 2 inches long, large, very similar to that of *P. Whytei* both in form and colour, except that the new one is a paler sea-green, exactly the colour of *Isia viridiflora*. The flowers open a few at a time, and as there are a great many buds the *Kew* plant will continue in bloom for some time. *P. chilensis* is also in flower in the same house.

### TREE TOMATO (CYPHOMANDRA BETACEA).

A fine specimen of this in the Temperate-house at Kew is now bearing a grand crop of egg-like fruits, and in the house where the succulent plants are grown another smaller specimen may be seen with a few ripe fruits upon it. The merits of this plant are recognised in many of our colonies, thanks to the authorities at Kew, who made it the subject of a notice in a number of the *Kew Bulletin* for last year. The fruit is certainly very palatable even when raw, much more so than many Tomatoes. To my taste it suggested a combination of Tomato and the fruit of *Passiflora edulis*. If this plant were taken in hand by growers of indoor fruits it would almost certainly prove a really valuable addition to the food plants of England, as it has already proved in the colonies.

### ANGOSANTHUS BREVIFLORUS.

This pretty bulbous plant from the Cape may now be seen in flower in the Cape-house at Kew. It is related to *Chlidanthus fragrans* and *Sternbergia*. The bulb is like that of *S. lutea*, leaves strap-shaped, 1 foot long, ¾ inch broad, appearing with the flowers. Scape erect, 9 inches long, stout, bearing an umbel of nine flowers, which are on erect stalks, tubular, 1 inch long, nearly an inch across at the mouth, the segments united at the base; colour bright yellow. This plant ought to become popular as an autumn-flowering greenhouse plant. Apparently it requires the same treatment as *Nerine*. It is a native of Natal, Grahamstown, &c., and is the *Cyrtanthus lutescens* of Mr. Adlam. A figure of it has been prepared for the *Botanical Magazine*. *W. Watson.*

## THE APIARY.

### SMALL SECTIONS.

By the time this article is before the reader, he will doubtless have covered up his bees for the winter. This does not, or ought not, to mean that therefore work is at an end. It is pleasant during cold winter days and evenings to hear the sound of the hammer and the saw, and the industrious apiarist will no doubt use both. We read in *Gleanings*, which comes to us from America, that a Mr. Harmer, of the United States, has made a small 2 oz. section. These are sold at grocers' shops and sweet-shops in America, and children as well as adults buy them, and eat them as children about here buy sweetmeats. There is this difference only, that honey is the most wholesome. We will endeavour, in our brief space, to explain how it is done.

Take a piece of board larger than the inside of a standard frame, and take another piece which will just go in and out of a standard frame easily. The latter ought to be about three-quarters of an inch thick. Glue these two pieces of wood together, one lying on the other. Then take a saw and cut as many squares as you can, slightly over 1 inch square, in the top piece of wood. Make the saw-cuts quite through the wood, and just to touch the second piece. Then take a jack-plane, set coarse, and get another piece of wood, any size, but 1½ inch thick, and plane off a lot of shavings. These will curl up, of course. Put them in water, and then lay

are filled the sections can be taken out of the frame in a mass, and can easily be separated with a knife. We trust we have made the matter simple, so that he who runs may read. We intend trying it ourselves. Of course eight of them would go to a pound, but to make it pay, eight of these sections ought to fetch more than a single pound. *Bee.*

### LILIUM NEPALENSE.

We give below an illustration (fig. 57)—thanks to the courtesy of Messrs. Low, of Clapton—of a Lily exhibited by them at the meeting of the Royal Horti-

## PLANTS AND THEIR CULTURE.

**CHRYSANTHEMUM FRUTESCENS.**—If a large batch of cuttings is now put in, they would make capital decorative stuff in the later spring months. Select stout close-jointed shoots of about 5 inches long, and if space can be afforded insert them singly in small pots, filled with sandy loam; water to settle the soil, and place them where they can be kept comparatively close for two to three weeks, when they will be rooted. Excellent results may be had with an ordinary garden frame covered at night with mats, and on the approach of severe weather moving the cuttings to

FIG. 57.—LILIUM NEPALENSE: COLOUR DEEP CRIMSON, WITH GREEN TIPS.

them out flat to dry. This forms a lot of veneer. When dry put double slips of veneer in every saw-cut, after the standard frame has been laid over the top piece of wood containing the saw-cuts. Then take little pieces of foundation which will just fill the spaces, and drop one in each square. The next piece of advice given by Mr. Harmer we do not agree with. He says, touch the inside of each square, and the foundation, with a small brush just touched with glue. We do not propose to give Englishmen glue, even in homœopathic doses, so we would advise the brush being dipped in melted wax instead. When dry, the frame can be lifted up; and if this is done carefully the sections will come up with it. These can be put away for use, and when the happy season arrives can be hung in the hive. When they

cultural Society on September 11 last, and which excited great attention. The plant from which our figure was taken was nearly 4 feet in height. The segments of the flower were greenish outside, internally intense red-crimson, and with light greenish tips. Stamens red, greenish at the base. Mr. Baker, to whom our drawing was submitted, remarks that the segments, as shown, are more recurved than usual, which he attributes to the flower not having been drawn until it had been expanded for some time. [This opinion is not shared by our artist. Ed.] The plant is a native of the Central Himalayas, and requires greenhouse treatment. It is probable that some considerable variation exists, as the figure in *Elves' Monograph*, and that given in our columns July 17, 1880, do not agree well with the one now figured.

quarters safe from frost. Low pits or houses with the means of keeping a minimum temperature of 45° are good places to winter them, but a shelf near the glass in a greenhouse will also do. The object to be aimed at is to prevent them from getting drawn—which they would very readily do—if far from the glass or with deficient light. To induce a dwarf, stubby habit, they should be pinched back several times during growth, so that when they receive their final potting further stopping would be unnecessary. In potting, use a rich loamy compost, and pot firmly. About the close of the year they will be nice stuff, ready to pot on into 48's and 32's. If it be desired to hasten a few of them, a temperature of 55° to 60° will bring them on; care must, however, be taken not to give warmth greater than that, or they will become drawn and useless. Give plenty of

air whenever it can be admitted with safety, and keep the plants clear of green and black fly and red-spider by means of mild fumigations with tobacco; but, failing this, dip the plants in some of the prepared insecticides.

Thorough syringing when growing is of great assistance in keeping them clean. There are several varieties, but those with small leaves are the freest growers and flowerers. Perhaps the best are the type—*frutescens* and *Halleri maxima*, whites; and *Etoile d'Or* or *Cloth of Gold*, for yellow; all of which are serviceable.

**Storing Bulbous Plants.**—*Caladiums* are getting over, and may be allowed to ripen off, their spades being better occupied with other subjects. In drying off the corms it is a good plan to get the plants closely together in a warm, dry part of the house, and give less water for a short time; this will stop active growth, and when the ripening is nearly completed they may be stored away for the winter in a place with a temperature of about 60°. I have been very successful in keeping these corms healthy by placing the pots beside the hot-water pipes in an intermediate-house; and if at any time they appeared to be too dry, a damping over with a rose pot kept them right. Sometimes when I have shaken them out or have left them in the pots in a cold place I have lost many; therefore it is safer to afford them a warm comfortable corner.

**Bougardias.**—Whether planted out or grown in pots in the usual way their treatment now will be about the same, namely, the maintenance of a suitable temperature, as without a sufficiency of heat their flowering season is soon over, and moreover, the flowers are of better colour and substance if a temperature of about 60° is kept up, more or less, according to the conditions of the weather. Therefore, all plants which are intended for autumn and winter flowering should now be placed where these conditions, and as much light as possible, can be afforded them—low houses with a steep roof and a sunny side, are to be preferred, as the plants are near the light and are not liable to become drawn; it is, moreover, a waste of fuel to heat a larger volume of air than is required. Where this kind of house is not available keep the plants well to the front in a light position of the house, where, with the temperature named, and by regular applications of weak liquid manure or slight top-dressings of some concentrated fertiliser, and care in watering, good results may be obtained. Keep the plants completely free from insects before they come into general bloom. Late plants for succession may still potted on, using, as before advised, a rich free compost.

**Dichorisandra.**—Of these plants several are very showy specimens, some having showy blue flowers, others ornamental foliage, as in the case of *D. musaica*, which has prettily marked leaves produced on stems rarely exceeding a foot in height. A free open soil of peat and loam, in about equal parts, with plenty of sharp sand, is a suitable one in which to grow the last-named species. The plant dislikes excess of water, either at the root or on the foliage, yet it must not be allowed to get very dry, being easily injured by either extreme. A dwarfier and more easily grown but less showy species, is *undata*, which has crumpled or undulated leaves, freely marked with longitudinal stripes, or bands of silvery-grey on a green ground on the upper surface; they are reddish-purple on the under side. It grows quickly, and is easily increased from cuttings, which, if put in now and treated in the usual way, will make nice little plants by early spring. *Musaica* may also be increased by cuttings, but careful division of the roots is the best mode. *Thyrsiflora* is a very different plant to the foregoing, being grown for its large trusses of dark blue flowers, which are borne towards the end of the growth of the current year. The plant is a capital grower, succeeding in almost any good loamy compost. It grows about 3 feet high, and it is surprising that so distinct an autumn-flowering plant is so seldom met with. It is just now beginning to flower, and is conspicuous and effective. After flowering, give water and air in the usual way until the growth is ripened; and when it begins to turn yellow and die down the pots may be laid on their sides and stowed away in a corner of the stove till next spring, when they should be brought out and repotted.

*D. Aubletii* has a slender, trailing habit, and requires support; it grows about 6 feet high, and is valuable as a climber where space is limited; the position need not be a sunny one. It flowers on small axillary branchlets in the late summer and autumn months, and after flowering it should be treated in the way recommended for *thyrsiflora*.

The plants are best kept always in the stove, and as the growth is more or less annual and herbaceous, to maintain the stock of plants in good condition a vigorous growth should be encouraged. *D. musaica* and *D. undata* look best when grown in pans, but *D. thyrsiflora* and *D. Aubletii* are finest grown in pots, of a size that will admit of liberal treatment. *F. Ross, Pendell Court.*

## THE FLOWER GARDEN.

**LAWNS.**—The mowing machines should now be thoroughly cleaned, oiled, and put away in a dry place. Levelling and turfing may be done at any time this month; the sooner the better, however, but do not be in a hurry to begin such work on very frosty mornings, but wait till nearly mid-day. In levelling inequalities avoid using rich soil, or the consequences will be a rampant growth and a patchy appearance for the greater part of next year. The soil should be well trodden down as the work proceeds, immediately afterwards relaying the turf; the latter should either be beaten down firmly or rolled several times with a heavy iron roller. Where there are many large trees and deciduous shrubs it will be next to impossible to keep the lawn in good appearance during the next few weeks, nevertheless leaves should be swept up frequently. The same remark apply to drives, walks, and other parts of the pleasure grounds.

**Rockeries.**—The present month is a very good one for commencing new work, and also for dividing and replanting many species on old rockeries; indeed, the latter operation is a much more important one than some persons suppose and it is not too much to say that some subjects fail or are but partially successful owing to the neglect of frequent division and transplanting. Where past neglect has been great, nothing short of a thorough renovating of the whole should be attempted. In doing this the old soil should be taken out to a depth of 6 inches, and replaced with suitable compost, which may consist of three parts sandy loam, one part leaf-mould, and a liberal addition of peat for plants that require it. It is impossible to enter into details regarding new work in this place, suffice it to say that stiffness in arrangements should be avoided, and due regard paid to the requirements of the various plants, viz., sunny exposed positions for those that need such, and sheltered, shaded, damp, for others; all of which may be secured by the intelligent planter. Surface composts of different kinds are also matters of importance, and ought to be got in readiness before planting takes place.

**Dahlia.**—Take up the roots of these, and store away in sand or cocoa fibre refuse in some cool place, not forgetting to re-label such as require it, and to examine them at intervals of a few weeks. *J. Horsfield, Heytesbury.*

## FRUITS UNDER GLASS.

**VINES.**—Examine the bunches of Grapes on Vines which have matured their crop for some time, removing mouldy berries before they infect others. Grapes in late houses should have finished colouring by this, but, where such is not the case, keep the pipes steadily warm, and give air freely on all favourable opportunities. A free circulation of dry, warm air is most conducive to the proper ripening of the fruit. Pinch out every lateral growth, to admit sunlight to the interior of the house. Mid-season Vines, from which all the fruit is now cleared, may have the shoots cut back provisionally to five or six eyes.

The early house should now be pruned, if it is not already done, so as to be ready for starting when the time comes. In pruning, do not go too close to the main stem, but rather select good plump buds, wherever they may be found. Make clean cuts, and be careful not to bruise the spur. When the sap dries up, rub the wound with a dry cloth, and dress with Thomson's styptic. Rub off all the loose bark from the stem with the hand, and well scrub the rods and spurs with warm water, soft-soap, and petroleum, using a stiff bristled spoke-brush for the purpose: as from its shape it can be easily manipulated amongst the spurs. Then the stems may be coated with a mixture of 2 oz. soft-soap, 2 oz. flowers of sulphur, to 1 quart of tobacco-water, thickened with clay to the consistency of paint.

Should mealy Bug have effected a lodgment in the house, more drastic measures must be taken for its extirpation. All the outer bark must be scraped, special pains being bestowed upon the spurs. Every scrap of bark removed should be caught on a sheet and removed to a fire every time the operator leaves his work; and wash the stems, &c., with a hard brush, two or three times with hot water to which a strong dose of petroleum is added. The Vines may then be painted with a mixture of 1 quart of coal-tar, 1 of water, made of the consistency of thick paint by adding yellow clay. When painting the canes stir the pot frequently. All parts of the structure should be scrubbed, and the whole of the interior painted; remove the soil clean away down to the roots, and top-dress with fresh loam, well dusting the roots previously with Thomson's Vine manure. Leave the house open night and day for the present. As soon as tree leaves are available the outside border should be covered with them to the depth of 18 inches, and thatched with Wheat-straw, giving it such a slope as will cast the water entirely off the border. This will impart no artificial warmth, but will retain much of the heat of the border during the winter months.

**Young Vines** will require a considerable amount of fire-heat to properly ripen the canes, and if such Vines are not already pruned they should be seen to at once and the plants removed from the open into a cool house. Dress all knife wounds with styptic. The structure for these plants should be at once got in readiness, cleaning every part thoroughly; paint the woodwork when necessary. *Wm. M. Bailie, Luton Hoo.*

## THE KITCHEN GARDEN.

**LATE POTATOES.**—These should now be taken up before the ground gets frozen, and dry sunny days should be chosen for the work, digging up the tubers early in the day, and allowing them to get dry before picking them up. Care will be necessary to ensure that no diseased ones are stored with the others. The sets for next season should be sorted out, separate baskets being provided for each size, and should then be spread out in a dry loft or shed where they will be secure from frost. To preserve the flavour of those required for eating they should be stored as airtight as is possible, and secure from frost, but not so dry as to cause shrinking; this is best achieved by placing them in small heaps in a dry situation, and covering them over with straw and earth. A ridge or heap should be 3½ feet high; a good covering of straw drawn straight is placed over them, and the whole is covered with 9 inches of soil beaten down firmly; a handful of straw may be left at intervals of 4 feet along the top of the ridge, projecting through the soil, so that heating of the heap may be prevented. Enough of the tubers should be kept out when storing in this manner for a three or four weeks' supply. Do not open a heap in frosty weather if it can be avoided. I find *Magnum Bonum* is still the best cropper here as a late variety, and it is of first-rate quality. Our soil is naturally dry, and contains a large quantity of lime. Snowdrop has cropped well too, this season, and is also excellent, but the tubers are more diseased than the first-named. Victoria is almost destroyed with disease—scarcely any tubers that are untouched.

**Lettuces** which are nearly ready for use, and those for the early winter supply, should be lifted and placed in cold pits. Autumn Cauliflowers will also require attention, breaking some of the larger leaves over the heart, or placing the plants in a dry shed if severe frost be anticipated. French Beans will keep nearly a fortnight in good condition if gathered dry, and spread out in a cool room. *W. H. Divers, Ketton Hall, Stamford.*

**FLOWERS AND INSECTS.**—An interesting example of mutual connection between flowers and insects we find in the *Ackerund Gartenbau Zeitung*. The colonists in Australia, especially the German ones, brought from home fruit trees, Apples, Pears, &c., but although they flowered well and abundantly, they bore no fruit. Lately another colonist brought bees from Europe, and the fruit trees in his own and his neighbour's orchards fruited well. There was an absence in Australia of the insects necessary to fertilise the fruit trees, these are the bees, which are now much cultivated for the sake of fertilising the flowers, and for honey.

Advertisers are specially requested to note, that, under no circumstances whatever, can any particular position in the paper be guaranteed for advertisements occupying less space than an entire column.

## APPOINTMENTS FOR THE ENSUING WEEK.

### MEETINGS.

MONDAY,	Oct. 15	National Chrysanthemum Society: Anderson's Hotel, 7 P.M.
TUESDAY,	Oct. 16	Royal Horticultural Society: National Apple and Pear Conference, and Great Show of Fruit, Chiswick, at 3 P.M.
WEDNESDAY,	Oct. 17	Royal Horticultural Society: National Apple and Pear Conference, and Great Show of Fruit, Chiswick, at 1 P.M.
THURSDAY,	Oct. 18	Royal Horticultural Society: National Apple and Pear Conference, and Great Show of Fruit, Chiswick, at 1 P.M.

### SALES.

		Bulbs from Holland, at Stevens' Rooms	
		Dutch Bulbs, at Protheroe & Morris' Rooms.	
		Clearance, of Nursery Stock, at the various Branch Nurseries, Kingston Hill, Norbiton, and Long Ditton, by order of the Executors of the late Mr. T. Jackson, by Protheroe & Morris (six days).	
		Nursery Stock, Greenhouse Plants, Greenhouses, &c., at the Bathwick Nurseries, Bath, by Protheroe & Morris (2 days).	Double Stocks.
MONDAY,	Oct. 15		
		Bulbs from Holland, at Stevens' Rooms.	
WEDNESDAY,	Oct. 17	Plants, Lilies, Bulbs, &c., at Protheroe & Morris' Rooms.	
		Choice Orchids in Flower and Bud, and 10,000 Japan Lilium auratum, at Stevens' Rooms.	
THURSDAY,	Oct. 18	Dutch Bulbs, at Protheroe & Morris' Rooms.	
		Imported and Established Orchids, at Protheroe & Morris' Rooms.	
FRIDAY,	Oct. 19	Bulbs from Holland, at Stevens' Rooms.	
SATURDAY,	Oct. 20	Dutch Bulbs, at Protheroe & Morris' Rooms.	

We gladly give prominence to the arrangements of the meeting and exhibition to be held at Chiswick next week. It is specially fitting that the meeting should be held in the old home of the Royal Horticultural Society, where a representative collection of fruit-trees may be seen, where the circumstances are so favourable for the exhibition of fruit, and where we may hope that the brilliant success achieved in the same gardens, in 1883, may be repeated. Specially appropriate also is the selection of our leading pomologist for the post of Chairman on the first day. His great knowledge, experience, and judgment will prevent much of that mischievous exaggeration and downright misstatements which are so likely to injure a good cause, but which have hitherto not been conspicuous by their absence.

As no direct commercial interests are involved in this Conference we may hope for the best results to fruit culture, and to the Royal Horticultural Society, which has rarely been occupied to better purpose. The following is the programme:—

On Tuesday, 16th, the Council will attend and formally open the Conference at 3 P.M.; on Wednesday, 17th, the chair will be taken by Dr. R. Hogg, and the papers to be read are "The Growth of Apples for Profit," Mr. G. Bunyard; "The Growth of Pears for Profit," Mr. W. Paul; "Stocks for Apples and Pears," Mr. T. F. Rivers; "The Fewest Varieties of Pears necessary to ensure Supplies of Ripe Fruit from August to March," Mr. W. Wildsmith; and "Pruning Apple and Pear Trees," Mr. Shirley Hibberd. On Thursday, Shirley Hibberd, Esq., will preside, and the papers to be read are:—"Canker in Fruit Trees," Messrs. J.

Douglas and E. Tonks; "The Enemies of the Apple and Pear," Mr. J. Fraser; "The Varieties of Apples for Sussex and their Cultivation on Heavy Soils," Mr. J. Cheal; "The Renovation of Old and Formation of New Orchards in the West Midlands," Mr. W. Coleman; "Apples and Pears suitable for Cultivation in Scotland," Mr. M. Dunn; and "The Cultivation of Apples and Pears in Jersey," Mr. C. B. Saunders. T. B. Haywood, Esq., will occupy the chair on Friday. The papers to be read are:—"Compensation for Orchard Planting," Mr. W. E. Bear; "Fruit Production and Distribution from a Provincial Point of View," Mr. E. J. Baillie; and "Railway Charges," Mr. D. Tallerman. The chair will be taken at half-past 1 P.M. each day.

Visitors from the country who propose attending the meetings may be reminded that the Gardens are within five minutes' walk of the Acton Green station on the Metropolitan District Railway, and trains run in half an hour from the City and West End stations every half hour. Visitors from the South will find trains from Clapham Junction to Chiswick Station, which is within a mile of the Gardens. The time occupied on the journey from the City is a little over half an hour.

MANY are the theories that have been promulgated as to the cause of the production of double flowers, but few indeed have been the practical experiments made with a view either to confirm or confute the assumptions that have been so freely made. But now we find a record in the *Journal of the National Horticultural Society of France* which bears so directly on the point, that we shall be doing our readers a service by calling attention to it. The record is taken from one of the reports of the German agricultural stations—institutions practically unknown here. The report in question bears the name of Dr. NOBBE—a sufficient guarantee of the credit that may be assigned to the experiments.

At the outset the point is clearly raised by the enquiry as to the reason why seeds of herbaceous plants improved by cultivation show a tendency to produce double flowers? Is there any appreciable relation between the nature and condition of the seed and of the flowers which result from their development? In the horticultural department of the experimental station at Tharand an attempt has been made to find an answer to these queries. For this purpose the common Stock was selected, as completing its development in the course of one season. Twelve distinct varieties were selected from the establishment of M. E. BENARY, of Erfurt. Of each of the twelve varieties 100 seeds, as nearly alike as possible, were chosen. These seeds were placed in Dr. NOBBE's germinating apparatus, and submitted to a continuous and uniform temperature of 20° C. (= 68° F.). After four days some of the seedlings (which must have germinated at once) were removed from the apparatus, and placed in the open ground. The other seedlings, which came up after four days and between four and nine days after the commencement of the experiment, were thrown away, so that the seedlings reserved consisted of two classes—one in which the germination had been accomplished within four days, and the other those in which germination was not appreciably commenced till after the ninth day. We need not give in detail the arrangement for the accurate comparison of the two sets of seedlings—suffice it to say that the seedlings were eventually transferred to large pots, and placed side by side half of the pot being occupied by those of slow growth, the second half by the quickly developed

seedlings. Moreover, some of the two sets of seedlings were placed in large, others in small pots; some in sterile sandy soil, others in rich soil, care being always taken to make the experiments rigidly comparable. In all, nearly 600 seedlings were thus under observation. In each case the time of the first appearance of the flower-bud was duly noted, and the period when the first flower opened. From the large mass of statistical details so obtained the general result was arrived at that, for each variety the period of time between the sowing and the appearance of the first flower-bud was long in proportion to the slowness of germination. In some cases an interval of five or six days was noticed between the seedlings of the two categories. The vigour of the plant was uniformly superior in those cases where the germination was rapid, and, moreover, when subjected to analysis the amount of dry matter as distinguished from water was always greater in the quickly than in the slowly developed plants.

But the most remarkable results are those relating to the production of double flowers. In all the varieties the proportion of double flowers was greater in the case of those that germinated quickly than in the case of the laggards. Ten plants of one variety with violet-brown flowers grown rapidly produced all double flowers, while eight plants of the same variety which had germinated slowly produced all single flowers.

The following figures convey other striking illustration of the facts now mentioned. Of one hundred plants belonging to nine different varieties the proportion of double flowers, according to the period occupied in germination, was as follows:—

	Doubles.	Singles.
After rapid germination	82.56	17.44
After slow germination	27.03	72.97

It may be suggested that the superiority might be attributable to the varying influence on the same seeds of light, heat, or moisture; but the experimenters reply that the tendencies exist in the seeds themselves, for the two categories of seedlings were exposed to identically the same conditions, and yet showed the differences already mentioned. Moreover, although those seedlings which were grown on in sterile sand were much less vigorous than those grown in good soil, they, nevertheless, showed corresponding inequality as regards their flowers. Again, next to never was a single flower found in the spikes, bearing from ten to thirty double flowers, and conversely.

Lastly, hybridisation shows that the seeds contain in themselves unaffected by other conditions the essence of what will be manifested in the plant later on. It must be added that there is in each variety a special tendency to produce double or single flowers as the case may be. There are some which, however treated, never yield any but single flowers, while others produce almost, or quite exclusively, double flowers, and are, in consequence, doomed to disappear.

These results are so striking that we cannot but think our great seedsmen will repeat the experiments in due season, and avail themselves of the valuable information thus placed at their disposal. That our horticultural societies will do anything so useful is, we fear, not to be hoped for.

**THE ROYAL HORTICULTURAL SOCIETY.**—It has been decided to hold a large horticultural show in the Temple Gardens on the Thames Embankment about the end of the month of May next year, the Benchers having kindly given their consent to the Society to make use of the gardens for that purpose.

**NATIONAL CHRYSANTHEMUM SOCIETY.**—A grand provincial show of this Society will be held at the Corn Exchange, Sheffield, on Friday and Saturday, November 16 and 17. Schedules for this Exhibition have been forwarded to all members. Any further particulars may be had on application to either of the Hon. Secs., Mr. W. K. Woodcock, Hon. Sec., Sheffield Chrysanthemum Society, The Gardens, Oakbrook, Sheffield; or Mr. WILLIAM HOLMES, Hon. Sec., National Chrysanthemum Society, Frampton Park Nurseries, Hackney. A Chrysanthemum Conference will probably be held on the evening of the first day, further particulars of which

inst., and will be continued every Thursday at 8 P.M., by R. J. HARVEY GIBSON, Esq., M.A., F.R.S.Ed. The object of the course will be to give an account of the structure and uses of the various parts of flowering plants, and the principles on which they are artificially cultivated; the origin of cultivated from wild plants, the diseases to which plants are liable, and the means adopted for their prevention and cure.

**THE GENUS PRIMULA.**—Dr. PAN, of Breslau, the latest monographer of this genus, admits 150 species grouped under sixteen sections distinguished

all the colonies; and agricultural labourers in Canada (in the summer months), New South Wales, Victoria, Queensland, Tasmania, and some districts of New Zealand; while mechanics are only in demand in very few localities, as in Melbourne for those connected with the building trades. Intending emigrants should write to the office, 31, Broadway, Westminster, S.W., as to the arrangements (if any) which are made by Colonial Governments, and in some cases by private committees and individuals in the colonies, for the reception and assistance of emigrants on landing. The committee wish to urge the need of careful selection in the case of emigrants, and of

FIG. 58.—ROCKERY AT PINNER, FROM A PEN-AND-INK SKETCH BY MR. T. WILKINSON. (SEE P. 416.)

will be duly announced. Visitors to Sheffield will be admitted after 3 o'clock on Friday at half-price, on presentation of the return-half of the rail ticket. The Midland Railway will convey exhibits at owner's risk, at single rate for the double journey, provided they remain the property of the exhibitor. A number of cheap excursion trains will be run into Sheffield on Saturday, November 17. — A general meeting of the Society will be held at Anderson's Hotel, Fleet Street, E.C., at 7 P.M., on Monday, the 15th inst., E. SANDERSON, Esq., in the chair.

**MECHANICS' INSTITUTE, WOOLTON.**—We learn that a course of ten free lectures on "Elementary Botany and the Principles of Gardening," in connection with this Institute, commenced on the 11th

one from another by the margins of the leaves folded inwards or outwards as the case may be, the texture of the leaves, the nature of the inflorescence umbellate or in superposed whorls, the calyx increased after flowering or not, and other characteristics.

**EMIGRANTS' INFORMATION OFFICE.**—This quarter's circulars, relating to Canada, the Australasian and South African Colonies have just been issued. Queensland grants free passages to female servants and selected unmarried agricultural labourers. Western Australia and Queensland grant assisted passages, and the two former and Natal nominated passages at reduced rates—mainly to female servants and agriculturists. Farmers with capital, and female servants, will find openings in

providing those who go out with money to keep them on arrival.

**"BOTANICAL MAGAZINE."**—The following plants are figured in the October number of this valuable publication:—

*Howea Belmoreana*, t. 7018.—A graceful Palm, of medium size (24 feet), with spineless, ringed, slender stem, and a crown of pinnate leaves, each about 6 feet long, with linear-oblong, plicated pinnae. The sessile flowers are borne on cylindrical spikes included within a leathery acuminate spathe. The fruits are olive-shaped, reddish-brown. The species is peculiar to Lord Howe's Islands off the eastern coast of Australia, latitude 32° S., with one or two other endemic genera of the same order.

*Rhododendron Colletianum*, t. 7019.—An alpine Afghan *Rhododendron*, of which a figure was given in our columns, September 16, 1888, p. 297, fig. 38.

*Iris Alberti*, t. 7020.—A species from the mountains of Turkestan, where it was found by Dr. ALBERT REEGL. It resembles *I. pallida* in habit, and, says Mr. BAKER, "is interesting botanically because it possesses a rudimentary crest and a fully developed beard down the claw of the outer segments, thus forming a connecting link between the two subgenera, *Pogoniris* and *Evsania*."

*Dianæ racemosa*, t. 7021.—A native of the eastern side of Table Mountain, at elevations of from 800 to 2500 feet, and extending thence to Grahamstown. The racemes are erect, four to nine-flowered, rosed; the dorsal sepal hooded, lateral sepals flat, ovate, spreading, as long as the hooded sepal; the lip linear. Each flower measures about  $\frac{1}{2}$  inch in diameter.

*Asarum macranthum*, t. 7022.—A remarkably curious plant, described by Sir JOSEPH HOOKER, and having cordate-ovate, many-ribbed leaves, green above, whitish beneath, with prominent reticulations; petioles elongate, erect, spotted with red. The flowers are borne in dense clusters at the base of the plant, each one about 2 inches across, with a bell-shaped tube and a limb dividing into five oblong-ovate wavy lobes, as long as the tube, and of a pale brown colour, tinged with yellow and purple. It is a native of Formosa, whence it was sent to Kew by Mr. FORD, the Superintendent of the Hong Kong Botanic Garden.

**INSECT LIFE.**—The United States Department of Agriculture has commenced the publication of periodical Bulletins devoted to the dissemination of information concerning the life-history of those insects in which the agriculturist is more particularly interested. The Bulletins in question are edited by Professor RILEY, the entomologist of the Department, whose name is a guarantee that the work will be carefully and accurately done, and with a special relation to the wants of agriculturists.

**FLOWERS FOR THE WORKING CLASSES.**—At the recent exhibition of the Van Houtte Club at Ledeberg a Silver-gilt Medal was offered for the best six plants of different kinds specially adapted for the decoration of the houses of the working classes. It was stipulated that the value of the lot should not exceed 3 francs, and that the exhibitor should be in a position to supply within twenty-four hours ten times the number if required to do so. The competition, as we learn from the *Revue de l'Horticulture Belge*, was severe. Mr. GYZELYNCK took the 1st prize, for *Pelargonium Lilliput*, tuberous *Begonia*, *Coleus* var., double *Petunia*, *Fuchsia*, *Dracena congesta* discolor. The 2nd prize went to M. E. VERAENE, for *Tradescantia multicolor*, *Pouretia mexicana*, *Dracena congesta* discolor, *Aralia japonica*, *Begonia Dregei*, *Apapanthus umbellatus* fol. var.

**PLANT COLLECTIONS.**—We are wont to regret the turning of private establishments into market gardens, and the substitution of mercenary for other considerations. However much we may regret it we have no right to blame those who deem it right and expedient to come into competition with the market gardeners. But it is curious to see that the same state of things which we lament now existed sixty-five years ago, when we find Messrs. LODDIGES expressing themselves in the following terms in the third volume of their *Botanical Cabinet*:—"For many years we have beheld with the deepest concern these and other causes gradually operating, to the breaking up of the several respectable collections which formerly existed in the vicinity of the metropolis. One by one have they fallen, and new ones have not arisen in their stead. The buildings which, once, filled with rare and splendid plants, delighted and elevated the mind, in not a few instances have been degraded into absolute potageries [sic]. The intellectual pleasures which their owners had formerly enjoyed in them were forgotten, and exchanged for

the gratification of gross and corporeal animal cravings. And thus stores were finally doomed to exist only as gratification and sort of manufactories of such things as early Potatoes, French Beans, small salad, or Mushrooms."

**THE CHISWICK SOIREE.**—We would remind our readers that the Chiswick Gardeners' Mutual Improvement Association intend to hold a soiree on the evening of Wednesday, the 17th inst., at the Chiswick Vestry Hall, for the benefit of the Gardeners' Orphan Fund.

**ROYAL HORTICULTURAL SOCIETY OF ABERDEEN.**—The acting Directors of this Society met in the office of the Secretary, Mr. A. M. BYRNE, Bridge Street, Aberdeen, on Wednesday evening, the 3rd inst., Councillor LYON, President, in the chair. The balance-sheet for the year showed a surplus of over £100, which was considered very satisfactory. The annual meeting of the Society was fixed for to-day (Saturday, 13th inst.), when, among other things, there will be discussed the propriety of holding a spring show.

**UVA GRASS (GYNERIUM SACCHAROIDES).**—Under the name of "Uva Grass," the large and handsome male flower-spikes of this plant are now offered for sale by Messrs. HOOPER & Co., Covent Garden Market. How they are obtained is not quite clear. Mr. GUMBLETON says he was told they were from the Congo, and the vendors say that they came from India. The plumes are 6 feet or more high, not unlike those of Pampas-grass, but much handsomer. They are, of course, dried, and the flowers are grey-brown. *G. saccharoides* is a gigantic Reed, native of Cumana, in Venezuela, where it is abundant on river banks. It is one of the most beautiful of all tropical grasses, the stems being 12 feet or more long, nearly 1 inch in diameter, the lower part clothed with brown sheaths, the upper bearing graceful arching leaves  $\frac{1}{2}$  yard long and an inch wide; the edges serrate, and the midrib channelled; they are arranged distichously. In habit the plant is not unlike *Arundo Donax*. The panicles are terminal, and about 4 feet of the upper part is clothed with long plumose branches of small flowers, the branches themselves being about  $\frac{1}{2}$  foot long. These measurements are taken from a fine living example of the plant which is growing in the tank with the Victoria Lily at Kew, and which flowered some years ago.

**POTATO TUBERS AND TUBERS.**—It has been long known that there exists a sort of relation between the production of flowers and the non-development of tubers. KNIGHT removed the young tubers as soon as they appeared, and found that the production of flowers was proportionately increased. M. WOLLYN, as cited in the *Annales Agronomiques*, arrived at similar results. Four plots were allotted to each variety under trial. One of the four was left untouched; in the other three the flowers were removed at three different periods. In the result, the removal of the inflorescence was usually found to increase the weight of produce. Nevertheless, some varieties, and those in which the flowers were removed till a later period, showed opposite results in the shape of a lighter crop, perhaps because of the short time which elapsed between the removal of the flowers and the formation of tubers, and also by reason of the dryness of the season (July 14—August 25, 1886).

**THE WEATHER IN SCOTLAND.**—In Aberdeenshire the weather of the past few days has been of a character little short of disastrous, it is to be feared, in its effects on the harvest locally. On Saturday last it became unseasonably cold, with cold driving rain from the north; and, toward the middle of the week, it had assumed an aspect of thorough winteriness, heavy and frequent showers of soft snow falling, with increasingly strong frosts at night, which must destroy all hope of the further maturing of the half-ripened grain. The terrific storm which broke out early on Thursday morning played sad havoc. The wet snowflakes adhered to the grain, and caused the stalks to become top-heavy, with the result that

large patches were flattened to the ground, while in other places the strong wind twisted the corn and rubbed off the grain.

**ENGLISH APPLE AND FRUIT-GROWING COMPANY.**—We understand that Baron ROTHSCHILD and Mr. MAPLE have taken up shares in this enterprise.

**GISHURSTINE.**—The manager of Messrs. PRICE'S Patent Candle Company reminds us, by a timely sending of their renowned Gishurstine for water-proofing boots, that the worst season of the year for the gardener is at hand. We can bear testimony to the efficacy of the article in question.

## SUTTON'S LATEST OF ALL PEAS.

THE introduction of Walker's perpetual bearing Peas was a great boon to many of us who have to get a large supply of vegetables all the year round; Until the introduction of the above variety it was my custom to make a sowing of the early white Peas about midsummer, for the purpose of providing a late dish or two in the autumn; but in unfavourable dry seasons these get so badly infested with mildew as to render them almost useless. Walker's Pea sown about the end of May was a valuable autumn vegetable, but these sometimes get the mildew rather seriously in a dry season. But for the last three years we have had grand rows of superb Peas named Sutton's Latest of All, a sample of which I enclose; these were sown June 2, and, as you will observe, with open weather, will produce a supply for a long time. If these were sown in large pots and grown outside until the approach of winter, and then put into an airy Peach-house, they would continue to bear until nearly Christmas. J. H. Goodacre.

## BARROW POINT, PINNER.

The gardens at Barrow Point Hill—the seat of W. Barber, Esq., Q.C.—are chiefly noticeable for their picturesque arrangement and the fine collection of hardy herbaceous plants. Within the compass of  $2\frac{1}{2}$  acres there are spacious lawns, mixed borders of rare plants, an admirably planned rock garden, miniature lake, with the more interesting aquatic and bog plants, collections of alpine plants and Lilies, and a fruit garden of espalier and bush trees. All the year round there is something to admire here, from early Snowdrops and winter Aconite, a host of golden Daffodils, Primulas, Auriculas, Roses and Lilies, till—

"Heavily hangs the Hollyhock,  
Heavily hangs the Tiger Lily,"

and the sad word, "Ichabod," is written across the glories of the parterre.

The house, which was formerly the residence of Lady Carr, has been considerably enlarged and improved under the directions of A. P. Seddon, Esq., Assoc. British Architects; and the grounds have been laid out under the care of the present head gardener, Mr. J. W. Odell. A long avenue of Elms, Chestnuts, and Oaks skirts the estate on the east, and a wire fence separates the lawn from pleasant meadows which stretch away to the quaint old village of Pinner. The tower of the ancient church rises from among the red tiled roofs and Elms, and on the right the little "Fin," from which the village takes its name, winds along beneath the shade of trees.

A distinguished visitor—and Barrow Point has many visitors—very happily described it as a "garden of surprises," from the varied attraction of its winding walks, which open up new vistas at every turn. Every opportunity has been taken by means of rustic arches of rude construction to afford support to various effective climbing among these are Ivies of several kinds, Honeyuckles, Roses, Aristolochia, Jasmine, Tropaeolum, and Clematis; of the latter the invaluable Jackmanni, montana, and the homely but elegant Travellers' Joy of the hedgerows. The method of growing climbers deserves more attention; the arches themselves when covered are sometimes charm-

ing pictures, and moreover they form a framework for objects of interest in or beyond the garden. The arches are gayest in the time of Roses, but till quite lately old Gloire de Dijon has been a splendid feature combined with the deep purple of Jackman's Clematis. To beds of light colours the larger leaved Ivies are a suitable foil, and furnish a series of pretty vignettes.

Another interesting feature is the rock garden (fig. 58, p. 415). A few years ago this was one of the weedy and neglected spots that is seen frequently on the outskirts of large gardens, the receptacle for the garden debris or an ever-smoking Valley of Hinnoom. How such an unsavoury corner may be made, not only innocuous but interesting and even beautiful, may here be seen. A few Elms and Ashes served as a nucleus round about which channels were excavated and the soil, chiefly clay, thrown into irregular heaps; pleasant shady walks wind to and fro through the little wilderness of pretty wildlings, among which the Fern family thrive amazingly. Many loads of burrs and stumps of trees gave further relief; soil was distributed over these, and the whole planted with suitable shrubs, hardy plants, bog plants, and alpine; while the water margin affords room for Lilies, Rushes, Caltha, and other aquatic plants. A rustic bridge spans the water, where one may stand and watch the gambols of the fish, and occasionally catch a glimpse of the kingfisher as he darts past.

Among the most conspicuous of the occupants of the rock-garden are several species of Mullein, Lythrum, Polygonum, Rosa rugosa, Helianthemum, Malva moschata, Foxgloves, Campanulas, Day Lilies, Golden Catalpa, Globe Thistle, Lobelia fulgens; and on the lower slopes, Arabis, Silenes, dwarf Phloxes, Saxifrages, and a host of pretty things which in spring produce masses of bright colour. One might get a dozen "bits" equally interesting with that here shown. We must not forget to note that several species of British Ferns are plentifully distributed, and with admirable effect.

Perhaps these gardens are at their best in May on account of the fine collection of alpine and the large number of Polyanthus and hardy Primulas planted out. Among these we noticed roses, denticulata, cortusoides, and nivalis. Poppies make a brave show, from the huge brilliant orange-scarlet P. orientale to the varying shades of P. nudicaule, and the still more chaste and delicate alpine Poppies, yellow, white, and terra cotta. Latterly the most showy flowers were the Helianthemum, Rudbeckia, Pyrethrums, Scabious, Olearia Haastii, Lechnis Flos-Jovis, Pentstemons, Gaillardias, Globe Ranunculus, the Peach-leaved Campanula, Lechnis Sieboldi and L. Haageana, the herbaceous Phlox of several varieties, Tritoma uvaria, and several fine clumps of Pampas-grass. One little bed of hardy Orchids was most interesting six weeks ago. Among them we noticed Cypripedium spectabile, C. rubescens, and C. arachnites; these were grown in shade, facing north.

Lilies are grown along a border on the left of a bed, near to the house; among them are L. giganteum, now bearing eight pods of seed; L. auratum, L. longiflorum, L. pardalinum, L. canadense speciosum, several varieties; L. candidum, L. colchicum, L. testaceum, and L. tigrinum. They show to great advantage against a background of evergreen shrubs. With these, too, and scattered about the various borders, are some of the finest varieties of Iris, among them being I. fimbriata reticulata and the chaste dark beauty, I. susiana.

Perhaps the most interesting part of garden work is the raising of seedlings of the choicer kinds of hardy flowering plants. Easily accessible from the house, and by the side of a pretty mixed border edged with dwarf cordon Apple trees, there is a series of nursery beds, which for months in the autumn furnish daily new delights. Among the species were Carnations, Pyrethrums, Polyanthus, Delphiniums, Campanulas, Antirrhinums, Pentstemons, and Gaillardias. Only the best specimens are promoted to the borders, and the remainder discarded or given away. A broad belt of Nicotiana

affinis is not only effective with a background of shrubs, but remarkably fragrant. One of the most brilliant bits of colour is that of a scarlet Tropaeolum, which was planted at the foot of a dead Apricot tree, facing south. It is now a broad sheet of green, thickly spattered over with the brilliant flowers. Less striking in colour, though equally beautiful, and far more tempting and tasteful, was a splendid crop of the old Moor Park Apricot. The mixed borders, of which there are several, have backgrounds of flowering shrubs and Conifers. Briefly, it may be said that the gardens of Mr. Barber are a fine example of what intelligent effort can accomplish in beautifying the scene in a short time. T. W., Harrow.

## REPORT OF THE SEED HARVEST OF 1888.

**RED CLOVER** (Trifolium pratense perenne).—Continental reports speak generally of very bad crops, more or less damaged by wet weather. American reports are also unsatisfactory, the shortness of crop in that country arising from the extreme drought at a critical period of the development of the plant. Very little English seed is coming forward at present, and there are no expectations of large outputs in the future.

**White Clover** (Trifolium repens).—The crop of this seed in Germany and Poland is reported to be one of the worst on record, and samples show very great damage by rain. Reports from France are somewhat similar, whilst America only expects moderate crops, the plant being more or less burnt up.

**Alsike Clover** (Trifolium hybridum).—It is expected that some fair samples of English seed, but in very small quantities, may come forward later. In Germany, Poland, Sweden, and other Continental producing districts of this article, the reports are exceedingly unfavourable, and it is almost impossible at present to estimate the extent of the damage done to the Alsike crop and to the Clover harvest generally by the wet season. It is full early yet for reliable information as to the American and Canadian crop, but the production of this article in the States is only limited in quantity.

**Trefoil** (Medicago lupulina).—This seed has suffered in the same disastrous manner, and high prices are easily made for good average samples.

**Lucerne** (Medicago sativa).—Crop is small, and higher prices than last year are being asked.

**Timothy** (Phleum pratense).—Promises to be better and cheaper than last year. The crop is large, and well harvested in the producing districts.

**Rape**.—Is a fair average crop; but in consequence of the wet weather there are very few samples coming forward in a suitable condition for export.

**Mustard**.—Fair average crop.

**Sweeds and Turnips**.—These, notwithstanding the wet summer, were harvested generally in very good condition; the prices at the present time being favourable to buyers.

**Rye Grasses** (Lolium perenne and italicum).—The crops in Scotland, Ireland, and France have been seriously damaged by rains, and samples are darker in colour than last year. We find the germination of the samples well up to the average. Prices will be certain to rule higher than last year.

## NATURAL GRASSES.

**Anthoxanthum odoratum** (Sweet Vernal).—A very fair crop, again showing high standard of germination.

**Agrostis stolonifera** (Florin).—A good average crop; but, as this grass is very subject to ergot, samples free from the impurity always command good prices.

**Alopecurus pratensis** (Meadow Foxtail).—This is again one of the short harvests, and few samples give the average germination of the past two or three years.

**Cynosurus cristatus** (Crested Dogtail).—Is a fair crop in England, Ireland, Holland, and Germany, but the colour is affected by the continuous rains.

**Dactylis glomerata** (Cocksfoot).—Very large importations have arrived from New Zealand, and as European samples have again high vitality, low values are reached.

**Festuca tenuifolia** (Fine-leaved Fescue).—This crop is again very light, but as its principal use is for the formation of lawns and pleasure grounds, it is not an important factor in the supply.

**Festuca duriuscula** (Hard Fescue).—Is a good average crop, the seed is again of high germination.

**F. pratensis** (Meadow Fescue).—Crop plentiful, and quality very fine, with high germination.

**F. elatior** (Tall Fescue).—This grass becomes more plentiful every year; still fine samples command good prices.

**Poa trivialis** and **P. nemoralis** (Rough-stalk Meadow-grass and Wood Meadow-grass).—Are fair average crops.

**P. pratensis** (Smooth-stalk Meadow-grass).—Reports speak of fair average crops, but, as usual, American samples prove, under test, to be very deficient in vitality.

As usual, there is no scarcity of inferior grass seeds in the market at all sorts of prices. James Carter & Co., High Holborn, London, and Mark Lane.

## TRADE NOTICE.

SAM. DEARDS & CO.

A COMPANY, of which the Secretary, *pro tem.*, is Mr. W. E. Deards, Dashwood House, 16, New Broad Street, London, E.C., has been formed for the purchase and development of the business of hot-water engineers, heretofore carried on by Mr. S. Deards. The share capital is fixed at £25,000.

## HOME CORRESPONDENCE.

**HARPALIUM RIGIDUM SEMI-PLENUM**.—In your issue of the 6th inst., p. 391, the Rev. C. Wolley Dod gives us some useful information as to the history of this beautiful hardy Sunflower. There is no doubt that the plant certificated is identical with the one distributed by the Rev. C. Wolley Dod as *Helianthus latiflorus*. The huge bunch of cut flowers placed before the Royal Horticultural Society by Mr. Ware, of Tottenham, was labelled *Harpalum rigidum semi-plenum* (Baker), *Helianthus latiflorus* (Wolley Dod). The Floral Committee evidently adopted the nomenclature of the new authority in preference to the name given by the Rev. Wolley Dod, who has undoubtedly been misinformed by his correspondent. *Harpalum rigidum* is a very valuable plant. I had a bed of them in flower this autumn, from which might have been selected several varieties. Although similar in habit and time of flowering, the flowers differed very much in form, some having only a single row of ray-florets, while others had two, three, and some even having an appearance of being double. C. S.

**PROLIFEROUS SPIKE OF PHALANOPSIS**.—The figure of this in last week's *Gardeners' Chronicle* (p. 389) represents a much more interesting fact than the short note which accompanied it would lead one to suppose. It is of course usual for *Phalanopsis* to develop young plants on the tips of the old flower-spikes, if these are allowed to remain long enough on the plants; but the spike shown in the figure was one which had been cut off the plant soon after the flower-buds began to expand, a heavy fog having almost denuded the spike—a very fine one—of almost all its buds. Instead of throwing the spike away it was left standing with its base in water in the house, where it had been grown, and in time it developed young plants in the axils of the branches of the spike, not on the ends. There were three young plants originally, but only two attained any size. Growers of *Phalanopsis* will see the difference between leaving the flower-spike on the plants in the hope of getting young ones, and removing the spike as soon as the flowers are over and placing it in water. As a means of propagating these plants, the flower-spikes may be turned to good account. As an instance, I may mention that we have only one small plant of *P. gloriosa*, which

flowered at Kew this year. When the flowers were over the spike was cut off and placed in water, and it now bears a young plant in one of the flower-axils. *W. Watson, Kew.*

**LAVINGTON CONQUEROR POTATO.**—I have sent you one root of a new Potato now under trial at Chiswick, Lavington Conqueror. I have grown the Potato four years, and with me it has resisted the disease better than any other, and I may say I have grown all the best varieties in cultivation. It has a very stiff, upright haulm, which is much in favour of it as a garden Potato. The tuber requires more time to cook than some others. Last year our tubers cooked well from November, 1887, until August, 1888, and were almost as good in colour in August as in November. I have seen many accounts in the *Gardeners' Chronicle* and other papers about disease resisting varieties. I thought I should like you to see a root as they come out of the soil. *J. Lye, Cliffe Hall, Market Lavington.* [The tubers sent with this letter were clean, fine white-skinned, oval in shape, and of first quality when cooked. It seemed to be a fair cropper, and the haulm was short. Ed.]

**MEDICATED TOBACCO PAPER.**—This is the name given to any article sold for the purpose of killing greenfly without doing any injury even to the tenderest foliage of Ferns. Being often obliged to remove tender plants and Ferns from one house to another before using the ordinary tobacco-paper, I got some of the medicated tobacco-paper, and am so well pleased with it that I would like to recommend it to my fellow gardeners. The price is 1s. 6d., per pound, but it is cheap at that figure. *R. C. T.*

**TRANSPLANTING FRUIT TREES.**—The time of year has now arrived for rooting-out barren or worn-out Apricot, Peach, Plum, Cherry and Pear trees, and planting-in young healthy trees. The old trees having been rooted out, attend to drainage, if necessary. If the natural soil in the garden is not of sufficiently good in quality, a compost, consisting of four parts sound fibry loam and one of old lime-rubble and wood-ashes, well mixed, should be put into the holes in a moderately dry state, so that it may not stick to the feet in treading on it. The new trees should be taken up from the nursery-ground with as much soil as possible adhering to the roots, so that only a slight check to growth may be experienced. In planting, make allowance for the soil subsiding 5 or 6 inches, within as many weeks from the time of planting. Having placed the tree in position, spread the roots out in every direction from the wall, with a little inclination downwards, shortening back at the same time any straggling roots, and cutting away any portions that may have been injured in the process of lifting. Make a series of incisions along the principal roots with a view to encouraging the emission of young feeders, covering them with a depth of about 6 inches of the compost before named, working it well among the roots before treading it gently over. This done lay on 3 or 4 inches of rotten manure as a mulching, which will maintain the roots in a more equable condition than could otherwise be secured. Fasten the trees temporarily to the wall with nails and long shreds, to allow of their sinking with the soil. Then, in the absence of rain, give the trees a good watering to settle the soil about the roots. The sooner the trees are transplanted after the crops have been taken in the autumn the better will be their chances of becoming re-established before shedding their leaves. It will be advisable, if the work be done in bright sunny weather, to hang a piece of tiffany or mats over the freshly planted trees during the heat of the day, and to damp them overhead with the syringe in the afternoon for a few days, so as to retain the leaves on the trees as long as possible. *H. W. Ward, Longford Castle.*

**TREES DYING OFF IN THE GARDEN.**—You ask us to send particulars of trees dying this year. An Apple tree in my orchard, about ten years old, has withered, as far as leaves and fruit are concerned. It is covered with fruit as big as a hen's egg, and, for no reason that I can make out, all have withered, but there seems to be some vitality in the wood, though I fear it will not recover. It is just possible that it has got down to an unsatisfactory subsoil. Here we are on the rock, and there is a nasty cold shale on the rock. Now that we are on this subject, I may tell you that I do not think Apples would ever pay in Cornwall, the trees are so covered with lichen,

and only a few sorts seem to do anything like well. An Apple called Polly, because raised in Polmassick, a hamlet in this locality, seems to do better than any, and it is a good Apple for either cooking or dessert. Can you tell me anything about the Vicar? or what would be the best sort to grow on a soil like mine? *N. Nevill.*

**OUR MARKETS.**—I beg to call attention to a growing evil amongst some of the commission agents in the Covent Garden market. Every week advertisements are inserted in the several gardening journals for cut flowers in any quantity, and upon the flowers being sent, a reply comes in due course that the market is glutted, that there has been no sale—only realised enough to cover expenses, &c. Now if this has been the case all through, why is the advertisement continued?—as, of course, it misleads people, and many people having small quantities only, and wishing to realise, forward the same, only to find that they have been altogether misled. I have taken the trouble to try more than one salesman. In the last case I forwarded, carriage paid and boxes my own, to a large firm—I box containing 24 dozen Asters, twelve in bunch, good blooms, well packed; 1 box of 5 dozen white Cactus Dahlias; 1 box, 4 dozen Dahlias, various. In return, I received a note saying, "Sorry, trade bad; market at present overstocked; season bad;" and a host of other troubles, upon which I reversed the paper and wrote asking for the result of sale, as the Asters were mentioned but no Dahlias. Upon which I get a reply, a copy of which I enclose. Another case—I sent 18 dozen Carnations, fair Sweet Peas, 1 dozen Roses, 5 dozen Dahlias, 3 dozen Harpallum, 2 dozen—all in separate boxes. Reply—"Not sold; no demand; market glutted." This first still advertises "Wanted any quantity," &c. *F. W. B.* [Our correspondent should enquire of his salesman, before sending, whether the goods are likely to be saleable. Ed.]

**THE LATE FROST.**—On the 2nd inst. we experienced the most destructive early frost that has occurred for many years. The thermometer here recorded 9°; it was no mere sudden fall of the temperature which sometimes happens, but was, in a gardener's phrase, a thorough frost, lasting all through the night. As might naturally be expected, and particularly so, considering the soft state of vegetation this season, the effects were most disastrous. Not only were all tender subjects cut off, but many that are hardier suffered likewise. I do not recollect any occasion when Peaches and Nectarines have been injured at such an early date. Late Admirable and Desse Tardive suffered considerably here, and among late varieties of Nectarines, Albert Victor fared the worst, some of the fruits near the summit of the wall being frozen through, and are now quite black. Coe's Golden Drop Plum was somewhat damaged. Vegetables, which were very bountiful, are now greatly diminished by the loss of Peas, Beans, Globe Artichokes, and a part of the crop of Veitch's Autumn Giant Cauliflowers, &c. We have also to rue the loss of so many beautiful autumn flowers, which are cut down entirely, as Asters, Dahlias, Japanese Anemones, Zinnias, &c., which are usually enjoyed for a much longer period. *Geo. T. Miles, Wycombe Abbey.*

**PHLOX DRUMMONDI.**—This has made one of the most useful of bedding plants during the wet and cool summer. Pelargoniums, Calceolarias, and the ordinary flowering plants that are employed to fill the flower-beds made but a poor display until the fine sunny weather of August set in; but the Phlox Drummondii, despite the rain, seemed to be as floriferous as ever, and in looking over collections, one is pleased to see that a new variety occasionally puts in appearance. The new varieties are much superior to the old, and are well worth growing for beds and in borders. *R. D.*

**RUNNER AND KIDNEY BEANS.**—In your report of the condition of the seed crops in Holland, mention is made of the lateness of kidney and runner Beans, and that the seed crop must be a moderate one. Things are perhaps rather worse in this country, and have been made so by the recent frosts, which, following in rapid succession, completely settled runner and dwarf Beans alike, so that their usual season of productiveness has been shortened at the back end fully three weeks, whilst the first portion of the season was fully a fortnight later; thus, the pod-production season, whether for seed or for market, has been perhaps one of the shortest on record. On both runners and late dwarfs, where the

podds were left to ripen from the first, the proportion fairly matured when seized by frost was about one-third. In the case of first early dwarfs, such as Ne Plus Ultra, for instance, the growth being less robust, the pods are nearly all ripe. Runners, however, are likely to be the worst seed producers, as being so much more fleshy or succulent; the frost may, in addition to having checked plant growth, also have destroyed the generative powers of the least ripened seed. It is a very uncommon practice to have to artificially ripen very late ripened seed, but in the present case the very early and severe frosts may have rendered that labour useless. To market growers the loss on the sudden destruction of a crop which was still selling very well is indeed considerable, but may be recouped by compelling an earlier and larger demand for Cabbages, Coleworts, and Brussels Sprouts, all of which are very abundant and early, whilst Autumn Giant Cauliflowers, too, are exceptionally good and plentiful. Spinach also is exceedingly abundant and good, and, so far, not injured by the frosts. I need hardly say that with the destruction of the Beans the Vegetable Marrows also followed suit, their case being perhaps the worst of all. *A. D.*

**NEW VEGETABLES.**—I think "A. D." has jumped very quickly to the conclusion that I was unable to distinguish any differences between the dishes of Long Red Surrey and New Intermediate Carrots shown at Shrewsbury. If "A. D." had seen the specimens referred to, I think even he would hardly have classed them as intermediate. I did not measure them, but the diameter at crown would be about 2½ inches, and the length of root 15 to 18 inches, gradually tapering the whole length. His statement that I could only have seen the New Intermediate Carrot there for the first time is on a par with some of his other statements. I may tell him that I have grown that variety as sent out by at least two of our leading seedsmen, and I assert that, as an Intermediate Carrot—as I understand the word—it is no improvement on James' Scarlet, but the reverse. The latter variety, as every gardener knows, is valuable on shallow or cold soils, where it would be impossible to grow long Carrots satisfactorily. By persistently selecting the longest and most tapering roots of James' Intermediate, the seed growers and nurserymen have made a great advance in the New Intermediate, as "A. D." says, but at the same time they are fast defeating the very object the raiser of the old Intermediate must have had in view in introducing it, namely, a short root for shallow soils. As to "A. D.'s" assumption that "most gardeners admit" the great advance made during the last twenty years in most kind of vegetable, some of which is really illusive where he says—"But there are several good things, and every gardener will admit the great advance in Cauliflowers made with the introduction of Veitch's Autumn Giant." I was under the impression, from reports of the wholesale houses, given from time to time in these pages, that the bulk of their trade was done in old standard varieties of vegetables, but from "A. D.'s" point of view I am again totally wrong, as he seems to think any check to the introduction of new varieties would be stagnation and ruin. As regards the Cabbages—our first point of difference—I would like to know if Little Gem has been tried at Chiswick, and if so, in what there reported as a distinct variety? *John Wilkes, Creswell Hall Gardens, Stafford.*

**APPLE CULTURE.**—Of late it seems to have become fashionable in some quarters to comment on the large sums of money we pay annually for foreign produce, chiefly for that of American and Canadian growth, and it is thought that money might just as well be retained in our own country, consequently a greatly extended cultivation of Apples is being strongly advocated. Amongst other things it is stated that our orchards are a "positive disgrace," that bad varieties should be replaced by better, that the best fruits of home growth are equal to those from America, &c. Well, my own opinion is that those who preach and advocate the above doctrine, have discovered a mare's nest which, if acted upon, will prove to be a white elephant, that in years hence it will be found to be a question of bad advice and so much capital lost. I freely admit that in good seasons the best fruits grown in Kent, Hampshire, and one or two other counties will compare favourably with those from America and Canada, but to generalise from that fact, and advocate the planting of Apple trees in all directions with a view to curtailing or obviating the necessity for this foreign supply,

appears to me to show a lamentable want of sound logic. Why are we being beaten in the home market? one may ask, and as readily answer, from causes beyond human control, viz., climatic conditions. Those who live the longest will learn the most on this particular point, and I can only hope that those who hold a contrary opinion to myself may prove to be right, and that I may be wrong. That there is room for a further extended profitable culture of small fruits in this country goes without saying, and it is impossible to see at present what the end of it will be, but the probabilities seem to be that when we have grown sufficient for our own requirements we may do an export trade. These remarks, I trust, will not be taken as emanating from a dogmatic spirit, and must be accepted for what they are worth. *Young Crab.*

**THE OLD MUSCAT OF ALEXANDRIA VINE AT HAREWOOD CASTLE.**—This fine old Vine, which may be termed the Hampton Court Vine of the North, so far as age and size are concerned, is this year producing a good crop of nice, well set, useful bunches. They are fully a month later in ripening than usual in more genial seasons. The house it fills is a lean-to, some 60 feet long by about 26 feet wide. It is planted outside, about the centre of the house, the main stem being brought in under the "pan" of the front-lights, at the top of which a branch has been taken horizontally to each end; from these other branches are taken vertically under each rafter to the top of the house. Owing to the size of the house and the extensive root-run in the border it is practically impossible to push it on in the usual sense of the term amongst gardeners, hence Mr. Fowler's anxiety to get the fruit fully ripe, so as to be able to keep them well into the new year, as is usual in more genial seasons. From an inscription on a stone let into the back wall of the house, I found it had been planted 105 years. *H. J. C., Grimsdon, October 1.*

**HEAVY CROP OF GROSSE MIGNONNE PEACH.**—In these days of progress Fruit Conferences have been held in different part of the country, in order to stimulate increased interest and culture in home fruits. While visiting gardens this season I have given more than usual attention to the condition of fruit trees. The other day, at the seat of the Earl of Galloway, Galloway House, I had an opportunity of inspecting the crop of outdoor fruits, and was much gratified to find excellent wall fruit, especially of Peaches, which were ripening well. The most notable tree there is one of Grosse Mignonne, bearing fine fruit. Mr. Day, the gardener there, whose heart is in his profession, and whose skill as a fruit grower has been recognised at the Edinburgh and Glasgow shows this season, and also on former occasions, weighed one of these in my presence, and which fruit turned the scale at 5½ oz. This tree was in good health, and bore a large crop of Peaches finely finished. Such fine samples are not often seen growing out-of-doors so far North. While visiting the neighbouring garden at Glasserton I saw an excellent crop of Figs outside, on the wall; many of the fruit weighed 7 oz. This tree covered 611 square feet of the wall, and always bears a fine crop of large Figs. *A. Milne.*

## SOCIETIES.

### ROYAL HORTICULTURAL.

**TUESDAY, October 9.**—The meeting held in the Drill Hall, James Street, Westminster, on Tuesday last was but meagrely attended by exhibitors, and the exhibits were few in number, if we except the magnificent display of Ferns made by Mr. H. B. May, of Edmonton. These filled up most effectively a broad table on one side of the Hall, and elicited unaffected admiration from the visitors. A little fruit was shown, viz., Plums, from the nurseries of Messrs. J. Veitch & Sons; Grapes, from Messrs. Rouppell, C. Ross, Bradshaw, and the Society's garden.

#### Floral Committee.

Present: G. F. Wilson, Esq., F.R.S., in the chair; and Rev. W. Wilks, Messrs. J. Laing, H. Herbst, W. Goldring, J. Walker, B. Wynne, W. Wildsmith, W. Holmes, R. Dean, C. Noble, C. Pilcher, J. Dominy, H. Ballantine, H. M. Pollett, J. O'Brien, E. Hill, Shirley Hibberd, G. Duffield, and T. Baines.

From Messrs. J. Veitch & Sons, Royal Exotic Nursery, Chelsea, S.W., there were a few exhibits, the central object being a new and very fine hybrid Nephrolepis. Pollen of N. Veitchii was sent by Messrs. Veitch to Mr. Lindsay, of the Royal Botanic Garden, Edinburgh, who happened to have female flowers of N. Rafflesiana in bloom at the time. The hybrid is named Dicksonii, after the late Prof. Dickson, of Edinburgh. The plant bore five fully developed pitchers, which are about 9 inches long, or more, cylindrical in shape, and pale apple-green, heavily splashed with purple-brown, the lid being marked with the same colour on the inferior surface; the ring at the mouth very prominent and dark red. The foliage, and the rim of the pitcher, clearly show the parentage of N. Veitchii, while the general form of the pitcher is like Rafflesiana. It is a remarkably handsome variety, although the first pitchers that were produced were so poor that it was almost determined to throw the plant away. From the same nurseries there also came specimens of Bouvardia President Cleveland, rich scarlet; Amasonia punicea, the scarlet bracts and stem, &c., well displaying the cream-coloured flowers; Amaylis Autumn Beauty, a pretty flower white netted with rose, as in A. reticulata, but paler, the leaves variegated, and the whole plant dwarf; several plants of the hybrid Begonia, John Heal, and Canna Ulrich Brunner, a plant of moderate height, with green leaves and large flowers of deep rich scarlet.

Messrs. H. Cannell & Sons, Swanley, Kent, sent plants of double tuberous Begonias: Mrs. Stark, with light yellow flowers, and General Chichester, warm rose, were certificated. Cut blooms of single varieties were sent by Messrs. J. Laing & Sons, Forest Hill.

Cut blooms of a Rose (H.P.) Denmark was shown by Messrs. William Paul & Son, Waltham Cross, Herts. Messrs. Paul had received the Rose from Messrs. Teiner, Lassen & Dithmer, of Elsinore, who hold the stock. It resembles somewhat Baroness Rothschild in colour, and apparently forms a good solid flower.

Mr. Ballantine, ex. to Baron Schroder, The Dell, Egham, contributed a specimen of Lælia porphyritis; the plant was about 8 inches in height; sepals and petals dull rose, faintly reticulate; lip deep purple-crimson, white at the base; column crimson at the apex.

Mr. G. Stevens, St. John's Nursery, Putney, S.W., sent Chrysanthemum Elsie, a reflexed variety, very lax, pale cream, deeper in the centre: a very pretty flower.

Adiantum Waltoni diffusum from Mr. A. Walton, Edge Hill Nursery, Burnley, was certificated. It differs from A. Waltoni in having smaller, more cuneate pinnules, and the whole habit is more spreading. Mr. Walton also had several plants of A. Farleyense, raised from spores collected from a plant in the possession of E. Eckroyd, Esq., Edgemoor House, Burnley, Lancashire.

Mr. C. Fardy, Warkworth, Northumberland, had Gladioli; and Mr. S. Ford, Leonardlee, Horsham, sent Nerine coruscans.

In the collection of Ferns exhibited in such capital condition by Mr. H. B. May, Dyson's Lane Nurseries, Edmonton, were many well grown large plants of Adiantum species and varieties, Aspleniums, Pteris serrulata, P. tremula, Davallia tenuifolia, Woodwardia, Nephrolepis in variety, &c. We may specify a few of the more striking or novel of these. The Adiantum group included—of Capilluveneria varieties, Daphnites, corubiense, Draperi, a fine tall grower; Fergusoni, slender in habit, and also tall, fissured, neat and low of stature, with divided pinnae; Veitchii, young foliage very bright—one of the prettiest; Adiantum cuneatum grandiceps is of good height, and possesses tufted fronds; A. tetraphyllum gracile has young fronds of a crimson tint, while the old ones are green in colour—8 inches high; A. Lathamii, A. Farleyense, A. Legrandi, and A. Bausei, a variety with graceful pendulous pinnae and fronds. Of Asplenium mention may be made of flaccidum, nobile, a pretty subject, with small linear pinnae; laxum, a Fern of light habit, and much divided compound fronds; cicutarium is a beautiful lace Fern, 1 foot in height, with a dense habit of growth. Lastreae were many; the best were aristata, of dense habit, and a slight variegation on the centre of the more subordinate portions of the frond; and erythroides, the young fronds of which have some bronze, some crimson tints. It is of a distinct spreading habit. In Davallias were observed—ajacensis, a dense umbrose species with a short triangular frond; feniuleaceum, a lace-like

frond, boldly arching, 3 feet in height; tenuifolia var. Veitchii, with a frond similar to the last-named, but less tall; elegans, a well-known species—a good basket plant. Nephrolepis davallioideus furcans is a fine species; N. Duffii has a very dense habit of growth; N. pectinata has a simple frond, having simple pinnae of almost equal length and breadth on its entire length. It is 1½ foot in height. Varieties of Pteris tremula were numerous, Mr. May possessing the whole stock of many of these. We may specify the following as being the most distinct—Grandiceps, tall and slender, inclining to be plumose at the extremities of the fronds; a variety with deep fronds, 3 feet high, not far distant from the original form; flaccida, 4 feet high, distinct, with arching fronds, and club-shaped twisted pinnae; in the best forms the twisting is very marked. Of Pteris serrulata there were several new forms, also of P. cretica. Notochloa chrysophylla is a very neat dwarf plant, good for the Fern case, as are likewise Gymnogramma Parsonsii, a dwarf golden Fern; Cheilanthes hirta var. Ellisi, and Pteris geraniifolia.

#### FIRST-CLASS CERTIFICATES.

Adiantum Waltoni diffusum, from Mr. A. Walton. Canna Ulrich Brunner, from Messrs. J. Veitch & Sons.

Nephrolepis Dicksoniana ×, from Messrs. J. Veitch & Sons.

Chrysanthemum Elsie, from Mr. G. Stevens. Double Begonia General Chichester, from Messrs. H. Cannell & Sons.

Double Begonia Mrs. Stark, from Messrs. H. Cannell & Sons.

Lælia porphyritis, from Baron Schroder.

#### MEDAL.

Silver-gilt Banksian.—To Mr. H. B. May, for group of Ferns.

#### Fruit Committee.

Present: Dr. R. Hogg, in the chair; and Messrs. H. J. Veitch, J. Lee, S. Ford, A. H. Pearson, J. Burnett, R. D. Blackmore, W. Warren, J. Cheal, and G. T. Miles.

Messrs. J. Veitch & Sons, Chelsea, S.W., contributed the chief exhibit, namely, a collection of twenty-seven dishes of Plums, all fine clean specimens, White Magnum Bonum, Jefferson and Pond's Seedling were specially fine; and Decaisne, Kirke's, Archduke, and Coe's Golden Drop were also good examples.

Seventeen varieties of Plums were sent from the Society's gardens at Chiswick, comprising such varieties as Mirabelle Tardive, Drap d'Or, White Bullace, Blue Damson, and White Damson.

There were several exhibits of Grapes. W. Rouppell, Esq., Harvey Lodge, Rouppell Park, S.W., showed specimens of Black Hamburg from an unheated house. They were freely coloured and of good appearance. Similar specimens were also sent from Chiswick. Mr. Rouppell also had Gros Colmar, finely coloured and heavily bloomed, which success he attributes to allowing the plants to retain more leaves than is generally the case; and a bunch of Cannon Hall Muscat, handsome and finely flavoured. Both Vines had been grown in pots.

Mr. T. Bradshaw, Downshire Gardens, Hillsborough Castle, Co. Down, and Mr. C. Boss, Welford Park Gardens, Newbury, also contributed Grapes.

Messrs. J. Carter & Co., High Holborn, London, W.C., showed Union New Model, a cross between Rousham Park Hero and Magnum Bonum, a large almost round yellow-skinned variety.

Laxton's Open Air Tomato was shown by Mr. R. Dean, Ealing, some of the finest being ripe, others not. It is a medium-sized fruit, and has strongly marked ribs.

Samples of the 'Planet' garden tools for kitchen and market garden work were shown by Messrs. Lloyd, Lawrence & Co., 34, Worship Street, E.C. These are drills, hoes, ploughs, &c., in combination, apparently well suited for what they are intended to do. They will be shortly tried at Chiswick, when we shall again refer to them.

#### MEDAL.

Silver Banksian.—To Messrs. J. Veitch & Sons, for a collection of Plums.

#### Council Meeting.

At a meeting of the Council it was resolved that a special general meeting of the Fellows be held at 2 p.m. on Tuesday, November 13, in the Council-room of the Society, 111, Victoria Street, to discuss

and pass the bye-laws. The Hon. Sec. reported that during the recess he had received an application from the Melbourne Exhibition Commissioners for a representative collection of English grown Apples and Pears to be sent out to Australia for the Exhibition, and that he had arranged to comply with the request immediately after the Chiswick Conference in the hope that many of the exhibitors there would allow their specimens to be sent out to the colony for that purpose.

The following candidates were duly elected Fellows, viz., Wm. Brooks, W. Dale, P. W. Fairgrieve, M. C. Mitchell, J. R. Whitley, A. N. J. Whitley.

### NATIONAL CHRYSANTHEMUM.

FLORAL COMMITTEE: October 10.—Mr. E. Sander-son, President in the Chair; there being a good attendance of members.

Messrs. W. & G. Drovers, nurserymen, Fareham, sent Dorrie, Japanese, a very fine early yellow, in the way of Mr. Garnet, but brighter in colour, and broader in the petal. (Awarded a First-class Certificate of Merit.)

Mr. E. Molyneux, of Swanmore Park Gardens, Bishop's Waltham, sent some very fine blooms of the grand Japanese named after him, the colour bright vermilion-crimson, with a golden reverse, broad in the petals; large, full, and very striking. (The Certificate of Merit awarded last year was confirmed.)

From Mr. George Stevens, St. John's Nursery, Putney, came Japanese Anna Roudier (Delaux), lilac-pink, a little darker than Coquette, very pretty and bright, but not sufficiently distinct.

From Mr. R. Owen, nurseryman, Maidenhead, came Japanese, Samuel Henshaw, an incurved flower in the way of Comte de Germiny, but thinner, pale rose surface to the petals, with a silvery reverse; one of the earliest to bloom of the Japanese type. Also M. Leveque, deep glowing pink—very pretty, and bright broad petals, said to be a sport from James Salter, but more reflexed and deeper in colour. (Commended.)

Votes of thanks were awarded to Messrs. H. Cannell & Sons, nurserymen, Swanley, for leaves of *Beta chilensis*, very varied in colour, and blooms of double Begonias. Also to Mr. R. Owen, for a stand of cut blooms of Japanese Chrysanthemums, consisting of Mons. W. Holmes, very fine in colour; Edward Molyneux, Mons. Dobroul, soft pink, the edges of the long thin petals, bluish; James Salter, Samuel Henshaw, William Cobbett, pink, broad petals; Miss Burgess, rosy-pink, a reflexed form, very pretty, in the way of Bouquet Fait which it greatly resembles in form, but with narrow petals, very promising; Monsieur Leveque, Rose Beauty, cinnamon-pink; and George Addison (incurved), very like the old Lady Talfourd.

### BIRMINGHAM GARDENERS' MUTUAL IMPROVEMENT ASSOCIATION.

The first meeting of the autumn session was held at the Midland Institute on Tuesday evening, October 2, the President, Sir Thomas Martineau, occupied the chair, and more than 100 members were present.

The President warmly congratulated the members upon the great success of the Society, and the excellence of the programme for the autumn session; he likewise drew their attention to the valuable horticultural education such societies and meeting must be given to the younger members of the profession. He remembered with very great pleasure presiding at the first meeting which was held to inaugurate that Society, inasmuch as it was one of the most useful and one of the most successful Societies that sprang into existence during the three years of his mayoralty.

At the close of his remarks, Mr. R. Parker, The Gardens, Impney Hall, Droitwich, gave a practical, instructive, and interesting paper on essential points in connection with the successful cultivation of our hardy fruits, and a lengthy discussion followed, which brought out much useful information, and a suggestion from Mr. A. Outram that a record should be kept in the library for the use of the members of such varieties that are known to do well in the district. A unanimous vote of thanks was tendered to Mr. Parker for his valuable paper; a similar vote was tendered to Sir Thomas Martineau for presiding. The meeting then adjourned till October 16.

### YORKSHIRE NATURALISTS' UNION FUNGUS FORAY.

The fungus foray of the Yorkshire Naturalists' Union is not an annual event like that of the Woolhope Club, or Scottish Cryptogamic Society, indeed, it is hardly likely to be until more of the numerous botanists who are widely scattered over the broad shire, pay more attention to the study of fungi. It is seven years since the Union had its last foray, the first ever held in the country, but it can be truly said that more practical work has been done during that period than since the time of James Bolton, of Halifax, one hundred years ago.

It seems, therefore, that an organised raid on the larger fungi, under competent guidance, can be the means of creating an interest in the study, and there is no doubt that the outcome of the Yorkshire Naturalists' foray, held on September 25, will be the means of giving a further impetus to the study of a much neglected group of plants. In every sense the foray was a success. The hunting ground was everything to be desired, being of a mixed kind and easily accessible; fungi were abundant, each one was in the best of humour, and this, coupled with beautiful weather, rendered the excursions most enjoyable.

As already intimated, mycologists in Yorkshire are not a strong body, yet sufficient numbers put in an appearance on the morning of the foray, in spite of the cloudy and threatening sky, enthusiastically enough, to carry out the programme in its entirety. Amongst these were the Rev. W. Fowler, M.A., Mr. G. Massee, F.R.M.S., of Kew, W. Cheeseman, R. Dewhurst, W. West, F.L.S., A. Clarke, C. Crossland, a few others, and the writer. Two parties were arranged, the larger one under the able guidance of Mr. Massee, to whom the success of the foray is due, investigating the woods of Bramham Park, a magnificent spot of nearly 2000 acres—the other scouring the most excellent old Fir woods of Wighton Moor, and the extensive woods (principally Beech) of Harewood Park, one of the grandest and most extensive parks in the country.

Better hunting-grounds could not have been chosen. Both parties collected a large quantity of fungi, and when the baskets were filled to overflowing, drove back to the Leeds Philosophical Hall, the meeting-place, and where the show was to be held.

It is very easy to collect fungi, when there are any fungi to collect, but to look carefully at every specimen picked up by a body of men during a day's ramble, in a limited amount of time, as well as several consignments collected a day or two before the meeting, from various parts of the county, was no light task. In fact, Mr. Massee was more than fully employed, and at this particular stage the services of other British mycologists would certainly have been an advantage. It was impossible to get through them all in the time allotted, yet sufficient specimens were laid out to constitute a "show," which was inspected by many members and friends who had been unable to take part in the foray.

Then the meeting was held, over which the Rev. W. Fowler, M.A. presided, and at which Mr. Massee was called upon to give the results of the day's work which he did. Altogether over 200 species had been collected, about forty of which were new to the West Yorkshire flora, and a few others which had not been seen in the Riding since Bolton's time. In the Hymenomycetes, white-spored species largely predominated and especially abundant were the genera *Hygrophorus*, *Russula*, and *Lactarius*. Several of the commonest species, e.g., *A. melleus*, *A. fascicularis*, &c., were apparently absent or nearly so. Amongst the principal finds were *Lactarius aspidius*, Fr., and *Russula cuprea*—a species included by Fries under *Russula nitida*, from which it is readily distinguished by the copper-coloured pileus and rose-coloured stem—both new to Britain. Other species of note were *Lactarius aurantiacus*, Fr., a really pretty species with a deep orange pileus and stem and decurrent gills, a close ally of *L. mitissimus*, Fr.; *Russula cerulea*, Fr.; *R. granulata*, Cke.; *Hygrophorus hypoleus*, Fr.; H. Clarkii, Berk.; H. calyptraformis, Berk.; and many others, that have the merit of being rare. Later in the evening, Mr. Massee gave an interesting address on the "Evolution of Fungi," which he dealt with in a masterly and humorous manner. A hearty vote of thanks to Mr. Massee for his address and other services brought the first day's meeting to a close.

Next day those members (who were not many) who were really desirous of knowing more about fungi again met, and devoted most of the day to

the examination of the more interesting forms. On this day the public also had an opportunity of seeing a "show" of fungi—a novelty in Yorkshire, hardly, perhaps, so attractive as a flower show, certainly as odorous, if not more so. Even the blind came to see them. From our point of view the foray was the most successful ever held in Yorkshire. H. T. Sopitt.

### NATIONAL FRUIT GROWERS' LEAGUE.

On Tuesday evening last the second Conference of the National Fruit Growers' League was held at St. Albans. The Corn Exchange was utilised for an exhibition of fruits. A meeting of the members was held at the Liberal Club, when papers were read by Mr. Sampson Morgan on "Fruit-growing for Profit," Mr. A. Bromfield on "Planting of Apple Trees," and by Mr. J. Gray Fleming on "A Proposed New System of Co-operation in Horticulture." Mr. Morgan read a letter from one of the largest fruit growers in the country in refutation of the allegation that fruit culture was unprofitable. He had planted Pippins and other kind of fruit, and at the end of four years raised at the rate of 90 lb. or 40 lb. a tree. This fruit sold at 20s. per cwt., and as high as 2s. per dozen, showing a return of £75 to £100 per acre. The ex-Mayor of St. Albans, Mr. J. Smith, presided over a public meeting in the evening. The following letter from Mr. Gladstone was read:—

"In testimony of my sympathy with the declared purposes of the National Fruit Growers' League, I need only point to my local action here, and my constant endeavours by public declaration to aid in stirring up the public mind, so that it may come to appreciate the very great national importance of the questions jointly embraced in the current phrase 'small culture,' whereof fruit-growing is undoubtedly one of the most important to growers, to consumers, and to our rural population, whose numbers it should increase, and whose wages it should sustain or improve.—Yours faithfully,

"Hawarden, Oct. 8." "W. E. GLADSTONE.

A resolution was adopted, calling upon the Government to provide facilities for the encouragement and establishment of small fruit farms as advocated by the National Fruit Growers' League, by which the English labourer might be easily supported by his retained upon his native land without pauperisation, relief works, or extraneous methods. Another resolution condemned the unparliamentary exportation of the crofters and other agricultural labourers by the expenditure of public money for such a purpose in face of the millions of acres of land lying unused in this country, which was a public and crying scandal, calling for an immediate remedy. Times.

### CRYSTAL PALACE.

OCTOBER 11, 12, AND 13.—The hardy fruit show this season, although not so fine as we have seen it, was an excellent one. Apples were generally clean and well coloured, and Pears were also satisfactory. Several fine exhibits of vegetables also made a good display. The collections of desert fruit were also of good average quality.

In the open class, for a collection of Apples, the place of honour was taken by Mr. J. Cranston, King's Acre Nursery, Hereford, with remarkably clean, fresh, and sound fruits of fine size. There were eight competitors, and in the collection 160 dishes. Tyler's Kernel, Blenheim Orange, The Queen, King of the Pippins, New Hawthornden, Grenadier, Gascoigne's Seedling, Peasgood's Nonsuch, Roundway Magnum Bonum, Kirke's Fame, Red Beitzheimer, and many of the popular sorts, as Warner's King, Stirling Castle, &c., were well represented. Mr. J. Watkins, Pomona Farm, Withington, Hereford, was a capital 2nd, showing grand fruits of Catshead, Ecklinville, Warner's King, Lord Derby, Mère de Menage, Stirling Castle, Tom Putt, Stoke Edith Pippin, Hanwell Sourcing, Melrose, Duchess of Oldenberg, &c., in all about 160 dishes. 3rd, Messrs. Bunyard & Co., Maidstone, with highly coloured and large fruits—about 150 dishes. Alexander was represented by especially fine samples, and there were also good dishes of Beaumaris Reineette, The Queen, Warner's King, Ecklinville, Reineette de Canada, Duchess's Favourite (fine colour), Lord Suffield, Small's Admirable, Lady Sudely, and Cellini. The same exhibitor also had baskets of Apples, containing some of the finest

specimens in the show. The Queen, Duchess of Oldenburg, Worcester Pearmain, Cellini, Warner's King, Grenadier, Cox's Orange, and Worcester Pearmain may be named.

Messrs. J. Cheal & Sons, Crawley, Sussex: H. Berwick, Sidmouth; and C. G. Selater, Heavitree Bridge, Devon, also showed well; but the Devon fruits were not so clear and plump as the others.

The best twenty-four dishes of Apples (dessert and kitchen) were from Mr. J. McKenzie, gr. to T. S. W. Cornwallis, Esq., Linton Park, Maidstone, in a good competition, with Peasgood's Nonsuch, Ecklinville, Emperor Alexander, Stirling Castle, and Fearn's Pippin, &c.; followed by Mr. A. Waterman, gr. to H. A. Brassey, Esq., Preston Hall, Aylesford, with very fine fruits.

Mr. C. J. Goldsmith, gr. to Mr. C. A. Hoare, Kelsey Manor, Beckenham, led for twelve dishes of Apples, Cellini, Ribston, Emperor Alexander, Peasgood's Nonsuch, and Warner's King being excellent samples.

Pears were not so numerous as Apples, but there was nevertheless a goodly number of dishes. In the large open collection Mr. J. Butler, gr. to A. J. Thomas, Esq., Sittingbourne, led in a very close competition, with over ninety dishes of fairly large fruits, well grown; Windsor, Marie Louise, Cassé Colmar d'Élé, Beurré van Geert, Beurré Bachelier, Vicar of Winkfield, Van Mons' Leon Leclerc, General Tottleben, Frévoist, Napoleon, Winter Nelis, Baronne de Mello, Beurré Luiget, Brookworth Park, Catillac, Pitmaston Duchesse, and Louise Bonne being some of the finest. Messrs. J. Cheal & Sons followed with a small collection of uniform quality, in which there were good specimens of Belle de Buxelles, Beurré Hardy, Duchesse d'Angoulême, Beurré Clairegeau, Jargonelle, Prince Albert, and Jersey Gratioli; 3rd, Messrs. G. Bunyard & Co., with ninety dishes of fair size, but not so clean. The best fruits were:—Beurré Hardy, Doyenne Boussoch, Souvenir de Congrès, Emile d'Heyet, and Daimo, a Japanese variety, pale yellow-green, spotted with brown.

For twelve dishes of Pears (amateurs), Mr. C. J. Goldsmith, gr. to Mrs. C. A. Hoare, Beckenham, led, with well-coloured fruits of Louise Bonne, Doyenne Boussoch, Williams' Bon Chretien, and Pitmaston Duchesse; Mr. W. H. Chisholm, gr. to Sir F. Geary, Bart., Tunbridge, followed closely.

The prizes offered by the Veitch Memorial Trust, for a collection of dessert fruit brought out a good show, in which Mr. J. H. Goodacre, Elvaston Castle Gardens, Derby, led well, taking the £5 prize and Bronze Medal. He staged a handsome collection. Gros Colmar, Gros Maroc, and Muscat Grapes, Braby Gage Plum, Princess of Wales Peach, Astrachan Apples, Powell's Late Apricot, Souvenir du Congrès and Pitmaston Duchesse Pears, Read's Scarlet Melon, and Pines Smooth Cayenne and Queen figured well. 2nd, Mr. W. Pratt, gr. to the Marquis of Bath, Longleat, Warminster, with better Muscats, but weaker in black Grapes. Marie Louise, Louise Bonne, and Pitmaston Duchesse Pears, Magnum Bonum Plums, and Pitmaston Orange Nectarine, were good dishes. Mr. E. Evans, Lythe Hill Gardens, Haslemere, was 3rd, with good Smooth Cayenne and Queen Pines, and a Black Ichia fig. Mr. J. B. Reid, gr. to E. Pettit, Esq., Broadwater, Oatlands Park, Weybridge, was 4th, with good hardy fruits.

#### VEGETABLES.

Of the prizes offered by Messrs. Sutton & Sons, Reading, Mr. T. A. Beckett, Cole Hatch Farm, Penn, Mr. Amersham took 1st, with fine Perfection Tomato, Autumn Giant Cauliflower, Chanceller Potato, &c.; Mr. J. Waite, Glenhurst Gardens, Esher, being a close 2nd, with good Leeks and Tomatoes.

For twelve dishes of vegetables, Mr. W. Pope, gr. to the Earl of Carnarvon, Highclere Castle, Newbury, was placed 1st in a large and close competition, having excellent Sprouts, Reading Exhibition Leeks, Carrots, Tomatoes, and Celery; 2nd, Mr. R. Lye, gr. to W. H. Kingmill, Esq., Sydnam Court, Newbury, with Carrots, Globe Artichokes, Celery, Onions, and Cucumbers, as his best dishes.

For the twelve dishes in competition for the Turner Memorial prize, Mr. C. J. Waite led in a very good competition, having a very fine lot, the strong features being Cardoons and Celery, Turnips, Tomato Reading Perfection, Autumn Giant Cauliflower, and Prizetaker Leeks: a very fine collection. Mr. J. Lambert, gardener to Colonel Wingfield, Onslow, Shrewsbury, was a very close 2nd, having enormous Cauliflowers (nine), Tomatoes and Carrots,

Globe Artichokes, Celery and Parsnips. All the articles shown by him were of large size and clean. 3rd, Mr. W. Pope, with a close clean lot.

Mr. A. Waterman, gr. to H. A. Brassey, Esq., Preston Hall, Aylesford, Kent, was first for a collection of vegetables arranged for effect, having fine produce, the roots being very good.

#### MISCELLANEOUS.

A collection of Apples from trees on the Paradise stock came from Messrs. J. Laing & Sons, Forest Hill, S.E., numbering in all forty-two dishes; and from the same firm there was sent a collection of cut flowers of tuberous Begonias.

Messrs. H. Cannell & Sons, Swanley, Kent, contributed a group of tuberous Begonias in pots, making a good display of colour.

Messrs. Sutton & Sons, Reading, had a collection of about twenty dishes of Potatoes, and also specimens of the new vegetable, Stachys tubifera, showing its free production of tubers.

Ornamental Gourds, Pumpkins, &c., were well shown by Mr. C. Osman, gr. at the South Metropolitan District Schools, Sutton, who took the chief prize for them.

## NOTICES TO CORRESPONDENTS.

BLUE ROSES: *American Correspondent*. Inquiries have been made as to this, and we are promised specimens next season! Meantime, as there are at least twenty genera to which the name Rose is popularly applied, it is charitable to suppose that the blue Rose is one of the twenty, and not a true Rose at all. That is the only explanation we can give. A true blue and a true Rose would be worth its weight in gold.

BOOKS: *G. M. Native Flowers of New Zealand* (Messrs. Sampson Low, Marston & Co., Fleet Street, E.C.).—*Garden and Forest* (Tribune Building, New York).—*G. C. P. Dictionary of Gardening* (L. Upcott Gill, 170, Strand, W.C.).—*Propagation and Improvement of Cultivated Plants*, by F. W. Burbridge (Blackwood & Sons); *Die Kunst der Pflanzen-Vermehrung*, by M. Neumann (Bernhard F. Voigt, Weimar).

CHERRY LAUREL LEAVES: *J. C. B.* The appearances on the leaves sent are not due to any fungus, but to the action of the sun shining on the leaves when wet. By the way, is the Cherry Laurel (*Prunus lauro-cerasus*) called Bay Laurel in your part of the world? The Bay Laurel, or Bay, is properly *Laurus nobilis*.

FUNGICIDE: *H. T.* We cannot discover the advertisement you allude to, and know nothing of the fertiliser of that name.

INSECTS: *J. R. H.* You would trap many by the use of short pieces of beanstalk stuck behind the branches of the fruit trees on the wall, and by bunches of dry hay placed on the ground at the foot of it, and kept rather close by being weighted with a board of 2 feet long. Every morning go to each beanstalk and blow out the insects therein, and remove the hay suddenly, and smash the insects found underneath it.

NAMES OF FRUIT: *R. H. T.* Oulin's Golden Gage. It is very late. When sending Plums to name, always send shoots and leaves when possible. *W. Hopwood*. The dark fruit was smashed beyond recognition; the red fruit was Pond's Seedling. — *A. Barker*. Pear quite decayed. — *Carter, Page & Co.* Pear Bishop's Thumb.

NAMES OF PLANTS: *Rosa*. 1, *Brunia pinifolia*; 2, *Protea nana*; 3, *Cliffortia ruscifolia*. — *T. W. R.* 1, *Hypericum elatum*; 2, *Prunus semperpariens*. — *A. Reader*. *Eragrostis curvula*. — *A. L.* 7 and 9, *Campanula*; probably two garden hybrids, as we are unable to identify them; 8, *Medicago echinus*. — *F. W. B.* *Hoberia populnea*, New Zealand. — *H. J. C.* The plants seem, as you say, to be natives of Palestine. We will endeavour to give you the names next week. — *A. B. D.* *Heeria rosea*. — *G. H. P.* 1, *Polystichum angulare*; 2, *Aspidium coriaceum* (capense); 3, *Goniophlebium subauriculatum*; 4, *Polypodium Billiardieri*; 5, indeterminate from sterile frond—send fertile frond; 6, *Onychium japonicum*; 7, *Nipholobus lingua*. — *Campio*. *Smilax aspera*.

ROSES: *W. C. S.* We cannot undertake to name varieties of the Rose. Send to a large grower of the plants.

THE MURRAY PINE: *Coatbridge*. This is *Frenela verrucosa*, a tree allied to our Cypressess.

TOMATO IN MANITOBA: *Correspondent*. In answer to your inquiry, we cite the following from Prof. Maccoun's *Catalogue of Canadian Plants*:—"Frequently spontaneous in gardens. Throughout Ontario Tomato seeds that have lain on the ground all winter vegetate in the spring, and are often transplanted. Spontaneous in one or two places near Halifax, N.S. (Lindsay). In this connection I may mention that Potato seeds always grow in the North-west after lying exposed on the surface of the ground all winter. While at Battleford, in the summer of 1879, I saw myriads of plants in an old Potato patch, and in October of the same year found the ground covered with Potato-balls (fruit), the seeds of which would certainly grow the next spring. I conclude from the above that both the Tomato and Potato are perfectly at home in Canada, and that in our North-west new varieties of Potatoes will yet be produced that will supersede the diseased or weakened ones of the East."

## Obituary

ALEXANDER LINDSAY.—At Ditton Park Gardens, Slough, on Saturday night last, died Mr. Alexander Lindsay, for some thirty-five years Head Gardener at Ditton, and the faithful servant of the Dukes of Buccleuch, and till recently of the dowager Duchess of Buccleuch. The deceased's illness extended over a period of two months, but was happily unaccompanied by any considerable suffering. We hope to give some particulars of Mr. Lindsay's life next week.

## THE WEATHER.

MEAN TEMPERATURE OBSERVED AT CHISWICK DURING THE WEEK ENDING OCT. 20. (AVERAGE OF FORTY-FOUR YEARS.)

Oct. 14 ... ..	51°·3	Oct. 18 ... ..	50°·0
" 15 ... ..	51°·0	" 19 ... ..	49°·8
" 16 ... ..	50°·7	" 20 ... ..	49°·5
" 17 ... ..	50°·5	Mean for the week ...	50°·4

## THE PAST WEEK.

The following summary record of the weather for the week ending Oct. 8, is furnished from the Meteorological Office:—

"The weather continued unsettled during the earlier days of the period, with falls of rain over our southern districts, and sleet or snow at our more northern stations. Towards the end of the week, however, the conditions improved, but fog or haze occasionally prevailed in some localities.

"The temperature has again been below the mean. Over southern, central, and eastern England the deficit has been as much as 11° or 12°, while in other parts of England it has been 9°, and over Ireland and Scotland 6° or 7°. The highest of the maxima, which were recorded on very irregular dates, ranged from 55° in 'England, N.E.', to 61° in 'Scotland, E.' On the first day of the period the maxima over south-eastern England were very low; at Cambridge the thermometer did not rise above 43°, and in London 45°. The absolute minima, which were registered either on the 3rd or 8th in most parts of England and on various dates over Ireland and Scotland, were very low for the time of year. Over the inland parts of England the thermometer fell to between 25° and 27°, and over Ireland and Scotland to between 26° and 29°. At Ingatestone on the 5th a thermometer on the grass fell to

17°, while the mean of the gross minima for the week was 21°·3.

"The *rainfall* has been rather more than the mean in 'Scotland, N.', but less in all other districts. "*Bright sunshine* has been more prevalent than it was last week, the percentage of the possible amount of duration having ranged from 21 in 'Scotland, E.', to 40 in 'England, S.W.', and 47 in 'England, E.'"

[Accumulated temperature indicates the combined amount and duration of the excess or defect of temperature above or below 32° F. for the period named, and is expressed in Day-degrees—a "Day-degree" signifying 1° continued for twenty-four hours, or any other number of degrees for an inversely proportional number of hours.]

Lepagaria, 12 blooms	...	— Parme, Fr., bun.	...

\* The sudden and severe frost (for the season) has considerably altered the prices for the time, many outdoor useful flowers being cut off, so that indoor flowers at the present time do not meet the demand.

## SEEDS.

LONDON: Oct. 10.—Messrs. John Shaw & Sons, seed merchants, 37, Mark Lane, E.C., report an active business passing in Clover seed at still advancing rates. Some strong German buying has materially driven up the prices of American red. In Alsike, white, and Trefoil, the late rise is more than sustained. Perennial and Italian Rye-grasses keep firm. Winter Tares are in good request on former terms. Seed Rye is steady. There is no change in either Mustard or Rape seed. Blue Peas, with a brisk inquiry, are considerably dearer. The new Haricots show fine quality, and sell at moderate figures. For bird seed the sale is small.

## FRUIT AND VEGETABLES.

STRAFORD: Oct. 9.—Supply has been good during the past week, and a fair trade was done at the following prices.—Cabbages, 2s. to 3s. per tally; Turnips, 30s. to 40s. per ton; Carrots, household, 35s. to 40s. do. do, cattle feeding, 25s. to 34s. do.; Mangels, 16s. to 20s. do.; Swedes, 18s. to 22s. do.; Onions, Dutch, 3s. to 4s. per bag; Apples, English, 3s. 6d. to 7s. per bushel; Watercress, 6d. per dozen; Pears, 3s. to 5s. 6d. per bushel; Walnuts, 9s. to 10s. per bag; do. 15s. 6d. to 17s. per sack; Tomatoes (Bordeaux), 9d. per small box; do. 3s. per large box; Damsons, 3s. 6d. per half-sieve; Plums, 2s. per molly; do. 3s. 3d. per sieve.

## POTATOS.

BOROUGH AND SPITALFIELDS: Oct. 8.—Moderate supplies and steady trade for best samples, but inferior very unsaleable, even at low prices. Regents, 60s. to 100s.; Hebrons, 60s. to 90s.; Early Roses, 50s. to 80s.; Magnum Bonum, 50s. to 100s. per ton.

SPITALFIELDS: Oct. 10.—Quotations:—Magnums, 55s. to 70s.; Imperators, 65s. to 75s.; Early Rose, 60s. to 70s.; English Regents, 65s. to 75s.; do. kidneys, 60s. to 70s.; Beauty of Hebron, 75s. to 80s.; and Champions, 55s. per ton.

STRAFORD: Oct. 9.—Quotations:—Magnums, lightland, 60s. to 80s.; do. darkland, 50s. to 60s.; Regents, 60s. to 80s.; Beauty of Hebron, 60s. to 80s. per ton.

## E. P. DIXON & SONS

BEG TO OFFER

RASPBERRY FOR COMING SEASON.

2s. 6d. per doz., 16s. per 100 for Planting Canes. 4s. per dozen, 21s. per 100 for Fruiting Canes.

 produced by parasites.

## FIR TREE OIL (SOLUBLE) INSECTICIDE

A combination of Hydrocarbon Oils, made soluble in  
 Water, for destroying ALL INSECTS & PARASITES  
 that infest Trees and Plants, whether at the Roots or  
 on the Foliage.

Sold by Seedsmen and Chemists, 1s. 6d., 2s. 6d., & 4s. 6d.;  
 1 gallon 7s. 6d., 1 gallon 12s. 6d., or less in larger quantities.

A Treatise on FIR TREE OIL, as an INSECTICIDE,  
 its application to Plants and Animals, sent Post free  
 on receipt of address, by the Manufacturer,

## Important Notice.

FIR TREE OIL so well-known as an Insecticide, is  
 effectual for washing household Cotton, Linen, and  
 Woollen Fabrics, and its disinfecting, bleaching, and  
 cleansing qualities when added to water for washing pur-  
 poses, will, after the first trial, recommend itself.

No Dry Soap or any such preparations must be used  
 with Fir Tree Oil.

Half a wineglass-full of Fir Tree Oil to 10 gallons of  
 water for steeping, and the same quantity to an ordinary  
 size boiler for boiling, with half the usual quantity of  
 household soap, will do the work splendidly, and with  
 half the trouble.

For washing Dogs, Pigs, and other animals, half a  
 wineglass-full to a bucket of water, and used with ordi-  
 nary soap, will do better than any of the prepared soaps  
 for killing fleas, preserving the skin healthy, and making  
 the coat silky and very beautiful. One trial will be  
 conclusive.

F.S.—Paraffin Oil will mix with Fir Tree Oil in propor-  
 tion of a quarter of a pint of the former to a pint of the  
 latter, and become soluble in water.

**E. GRIFFITHS HUGHES, Manchester.**

Wholesale: Hooper & Co.; Corry, Sopar, Fowler & Co.

**HOLLOWAY'S PILLS.**—The Great Need.—The blood is the life, and on its purity depends our health, if not our existence. These Pills thoroughly cleanse this vital fluid from all contaminants, and by that power strengthen and invigorate the whole system, healthily stimulate sluggish organs, repress over-excited action, and establish order of circulation and secretion throughout every part of the body. The balsamic nature of Holloway's Pills commands them to the favour of debilitated and nervous constitutions, which they soon resuscitate. They dislodge all obstructions, both in the bowels and elsewhere, and by that power, much sought after for promoting regularity of action in young females and delicate persons who are naturally weak, or who, from some cause, have become so.

Established 1841.

**W. GORDON, IMPORTER OF ORCHIDS.**  
An immense Stock of recently-imported Plants impels a sale of the establishment and of the make room. They have not yet flowered, but are all flowering plants, and must be sold at a great sacrifice. Very valuable varieties are certainly to be obtained, and great bargains. See Public Journals for high prices recently obtained. The Special Offer affords a paying investment to anyone with glass at command, which should not be overlooked. Such plants may never again be offered to the public under the Trade. *LILIES*, Silver Bantian Media, Silver Medal National Chrysanthemum Society, September, 1888. *JAPANESE MAPLES*, Silver Bantian Media.  
" *TREE PEONIES*, 7 First-class Certificates.  
" *IRIS*, most gorgeous, 4 First-class Certificates.  
" *CATALOGUES* of the above on application to The Nurseries, Amyand Park Road, Twickenham—English.

46A, King William Street, LONDON BRIDGE.

## HELLEBORUS NIGER, OR CHRISTMAS ROSES.

I can offer a magnificent lot of Christmas Roses, probably the finest lot in the Trade, especially of the *H. niger* major variety, which is the great favourite among market growers. These now offered are home-grown clumps full of flower-buds, and will be ready to lift in October; and I would advise early orders to secure them, as the stock of fine clumps is very limited.

### MAXIMUS.

A robust variety, the largest of the group, and very ornamental as a foliage plant. Its flowers in October and November, the blossoms are large and white, shaded with rose on the exterior, and generally produced in twos, but if shaded or a glass placed over the plants, the flowers are then pure white. By shading the flowers can be retarded even to December. It is the most vigorous of the section, and succeeds where many of the others fail to grow.

### MAJOR.

Although this plant is frequently offered, it is seldom to be obtained true to name, owing to its great value for cutting purposes. The flowers are pure white under glass, but have a slight rosy tinge in the open; it is the greatest favourite among market growers, producing flowers from December to January. It is a grand variety for potting; the foliage is so close and compact, and the flowers abundant.

### RUBRA.

—One of the most distinct and novel of this group. The flowers are large, produced about the end of January, and of a lovely colour. It is a robust grower, free blooming, and a decided acquisition for cutting.

### RIVERSTONI.

A fine distinct variety, somewhat in the way of *H. maxima*, but with smaller foliage, yet a strong robust variety. The flowers are produced in pairs, pure white, and blooming in the open at Christmas, a little earlier than *major* and later than *maximus*, thus forming a nice succession, and will be found a fine addition to our list of these useful winter-blooming plants.

### COLLECTED PLANTS.

These are far superior to the ordinary stuff generally offered, which are usually dried up and half dead before received, being collected by inexperienced men; those now offered are fine healthy plants, and usually are as fresh as when first lifted, and always do well.

Prices on application.

**THOMAS S. WARE,**  
HALE FARM NURSERIES,  
TOTTENHAM.

**JERSEY FRUIT TREES AND ROSES.**  
Carriage Paid. Strong healthy trees, the finest that money can buy. Roses wonderfully cheap. Cordons a speciality. Before ordering be sure to write for our Illustrated CATALOGUES. JOSHUA LE CORNU AND SON, High View Nurseries.

### RHODODENDRONS.

An immense Stock. 200 Named Sorts, from 1 foot to 5 feet high, including many varieties of our own raising, in addition to the best varieties of other raisers.

### AZALEAS.

Many thousands of *Azalea mollis* and other choice varieties, well-budded plants.

Silver-variegated, Hodgins' and other Hollies.

Of these we have a surplus stock, and can offer them at low prices.

Priced Descriptive CATALOGUE of the above and General NURSERY STOCK free on application.

# NOVELTY FOR 1889.

SPECIAL OFFER TO THE TRADE.

(From the *Gardeners' Chronicle*.)

## KALANCHOE CARNEA.

Awarded a First-class Certificate, Royal Horticultural Society, January 11, 1887.

# JAMES VEITCH & SONS

*Beg to direct special attention to this Sterling Novelty  
now offered for the first time.*

This strikingly beautiful decorative plant commences to flower at Christmas, and continues in bloom throughout January and February, and is a most welcome addition to the winter flora; its bright and pleasing colour being very attractive during the dull winter months.

The plant was recently introduced from South Africa, is of easy culture, very floriferous, and succeeds well in a temperature of 50° to 55°; it attains a height of about 18 inches, and is of good bushy habit.

The flowers, which are borne in large clusters, are of wax-like consistency, last a long time in perfection, are of a beautiful delicate pink colour, and, in addition, are deliciously fragrant, which greatly enhances the value of this charming plant.

Retail Price, 1s. 6d. per packet. Trade Price on application.

CHISWICK FRUIT EXHIBITION AND  
CONFERENCE.

THE following are the papers read at this meeting up to Wednesday night. A summary of the discussion which ensued is given in another column, as also a full report of the exhibition. The other papers will be printed in our next issue.

APPLES FOR PROFIT.

By Mr. GEORGE BUNYARD, Maidstone.

THE commercial growth of Apples for market is frequently entered upon in a wrong manner, because many start into the enterprise without sound information. Beginners shy of the growers of trees for sale under the unfair notion that they would recommend those kinds of which they held a stock; they then procure the "tip" from the salesmen in the various markets, who, as far as they can (and in good faith), give them the names of the kinds that sell well; fruits, so to speak, which dispose of themselves by their names or appearance. Many of the choicest Apples produce but a small crop, or are so long in coming to a state of profitable production that planters get discouraged; others are recommended which are very slow growers, or rarely make good orchard trees, and thus land is not fully utilised. As the markets are supplied from a large area, the salesmen have but a general idea of the suitability of sorts to a district, and hence much valuable time is lost. In the short time at my disposal, I propose to give a few hints as to the formation of a profitable Apple orchard or plantation, where the return shall be speedy, and yet in the future, for a century, shall promise a good result. The first operation is the procuring of suitable land.

In a district where little fruit is grown, an idea can be gained from the growth of the few fruit trees in the cottage gardens, and perhaps the orchards near gentlemen's seats. If the Apples show a kindly and clean growth, with an absence of lichens and canker, and if Elm trees flourish, it will so far be favourable. Exposure to prevailing winds is to be avoided, either by shelter-planting, or, better still, by taking advantage of existing woods or hedges;

and a slope to the south or west is to be preferred, but in order to secure a permanent orchard, care must be taken to get deeply cultivated, or rich, deep soil, or a few years of fertility will only be the precursor of decay and disappointment.

Having settled on suitable land, the tenant or purchaser next proceeds to put the land in order for planting, either by steam cultivation, or by thorough digging or trenching—the latter, though expensive at the start, is of permanent benefit. This operation is best done before the frosts set in, that the land may be purified and sweetened by exposure. The ground should then be set out, and standard trees, on the Crab or free stock, of the following sorts, planted 24 feet apart, requiring seventy-five to an acre:—

#### APPLES FOR STANDARDS ON WARM LOAMY SOILS.

1. *Desserts to Pick and Sell from the Tree.*—August: Devon Quarrenden, Sugar-loaf Pippin. September: Lady Sudeley, Yellow Ingestrie.

2. *To Store from October to Christmas.*—King of Pippins, Mabbott's Pearmain, Cox's Orange, Blenheim Orange.

3. *Kitchen Apples to Sell from the Tree in August and September.*—Early Julien, Keswick Codlin, Lord Suffield, Duchess of Oldenburg, Councillor, Grenadier (true), Ecklinville.

4. *To Store from October to December.*—Warner's King, Schoolmaster, Lord Derby, Golden Noble, Tower of Glamis, Waltham Abbey.

5. *To Keep from January to May.*—Wellington Winter Queening, Norfolk Beaufin, Lady Henniker, Bramley's Seeding, Annie Elizabeth.

If the soil is cold but rich, omit Suffield, and add Lord Grosvenor, and omit Cox's Orange and King of Pippins.

So far for the top crop, the space between being utilised by placing three two or three year old dwarf trees between each standard, others at 6 feet apart, which, less 75 for standards, will be 1135 per acre, until the plantation is filled up. These dwarfs will produce the best fruit from trees on the Paradise or surface rooting stock, and may consist of the following:—

#### APPLES FOR BUSH OR FREE PYRAMIDAL STYLE TO BE GROWN ON PARADISE STOCKS.

6. *Dessert kinds to sell from the tree.*—(7.) Early:—Gladstone, Red Juneating. September:—Colonel Vaughan, Duchess Favourite, Worcester Pearmain, Duchess of Oldenburg, Yellow Ingestrie.

(8.) *To store for sale from October to February.*—Cox's Orange, Cox's Pomona, Peasgood's Nonsuch, Gascoyne's Scarlet, Beauty of Kent, Baumann's Reinette.

If the soil is cold, omit Cox's Orange and Worcester, but if very rich and good warm land add Adams' and Hubbard's Pearmain, Rossa, Nonpareil, and Gipsy King, while for very late keeping Golden Knob, Sturmer, and smaller fruit of Mignonne are useful.

(9.) *Kitchen Apples of large size to sell from the tree (on dwarf's).*—Lord Grosvenor, Ecklinville, Mank's Codlin, Golden Spire, Pott's Seeding, Stirling Castle, The Queen, Small's Admirable, Grenadier, Councillor, Stone's.

(10.) *Fine kitchen Apples to store (on dwarf's).*—Lord Derby, Muriel's Seeding, Winter Peach, Lane's Prince Albert, Dutch Mignonne, Bismarck.

In six years' time the trees immediately beneath the standards can be transferred to other land, and will, if removed with care (in October or early in November), suffer little from lifting, and in the second year will produce heavy crops. After the sixth season the orchard should be left with a permanent crop of dwarf Apples and standards at 12 feet apart. The dwarfs at some future time could be cut away, and the standards, which

would then be established and strong, should be laid to grass, and thus fodder for sheep keep and a top crop of Apples could be secured annually. Until the 6 feet trees cover the land Potatoes may be grown between the rows, or Lily of the Valley, or Daffodils. But if land is cheap the space may remain without crop, and the roots will benefit greatly from the run of all the land. Weeds must be kept down, and if standards only are planted, no corn crop must be taken; but in this case soft fruit may be placed between them. The plantation should be dug in December or January each year, and be knocked over with a prong hoe in March.

Oxen and horses should not be allowed in young orchards. Shelter can be quickly obtained by planting Damson or bush Plums (the latter a Kent sort) with Crawford or Hessele Pears as an inner line at 12 feet apart, and this screen would pay its way. If desired, Plums could be placed between the Apple standards and Gooseberries and Currants, omitting the dwarf Apples. If the land is properly prepared the Apples should need no manure for some years, as the use of stimulants while the trees are young is prejudicial by inducing a sappy unripened growth which lays the tree open to damage by frost. When the trees are carrying a heavy crop, mulching may be carried out in June, or liquid manure can be used with advantage in the growing time. Such a plantation as described would commence to bring a return from the dwarfs in two years, and the fruit with a little care in thinning would command a ready sale, because, when growing in this manner, it is cleaner in appearance and much larger in size. In three or four years the standards would commence to fruit, and a much larger return would annually be made, and if properly managed, at the end of fourteen years, the crop would buy the fee-simple of the land outright.

In order to make the highest price, all fruits should be "graded," as the Americans say, and be of an even sample throughout, be properly named, and packed carefully, so that the baskets open clean and bright at the market. In the case of choice dessert kinds it would probably pay to pack them in light card boxes, such as those introduced by Mr. Tallerman for Cherries, &c., and manufactured by Messrs. Johnson (figured at p. 135, and also p. 292). In fact, we should take a leaf out of the French books, and put up our produce in an attractive form. The pruning of the Apples in February or March is of the simplest, no Apples should be pruned the first year of planting; for the first two years commence to form the standard trees by taking out all the inner wood to attain a bowl shape, and cut back the young growth to four or six eyes, to a bud pointing outward. The fourth or fifth year shorten, the wood of the current year to 6 or 12 inches, and keep the centres clear, and after that time let them grow as they like, merely shortening the tips to procure an evenly balanced head, and taking out any crossing pieces of growth. The dwarf can be cut-in to form pyramids or basins, as desired, for two years, and after that be allowed to grow freely. Other matters, such as securing the limbs in a heavy crop, and staking the standards, will have to be attended to, and the stakes must be removed from the standards in the winter as soon as the trees can do without support, as the ties are apt to cut into the bark and produce canker.

For Apple growing land need not be contiguous to a railway station, as they will travel well if carefully packed. Storing enables a grower to realise a high price at a time when good Apples are scarce; where proper stores, such as the Hop

oasts of Kent, do not exist, a frost-proof shed will do; and if care is taken to store all sound fruit, a thick covering of straw will effectually exclude frost, and keep the fruit plump and heavy. If 1100 trees bore half a gallon each, at three years old the crop would be about 70 bushels per acre, which, at 4s. nett (carriage and salesman's charges deducted), would give a return of £14 per acre; at five years 1 gallon each would double the produce; and so on. When the top and bottom crop come to pick, an average of half a bushel per tree would give a return of about £120 per acre. The risk of loss by wind is small with dwarf trees, and the cost of picking is less than in tall trees, and they can be readily thinned and attended to.

A word as to old existing orchards. My recommendation is, "Woodman spare that tree." If such old trees are well manured, in two years they would be either producing good fruit, or, if cider Apples, they would so benefit from the improved culture that they should pay for re-grafting with superior kinds. I believe much may be done in this way, as the roots soon respond to generous treatment, and the foundation of success rests upon them. Suitable kinds for grafting on old trees would be:—Stone's, Lane's Prince Albert, Small's Admirable, the new and splendid Bismarck; or the smaller dessert Apples, such as Duchess Favourite and Yellow Ingestrie.

The list of fruits given is more extended than is advisable, but it may only be possible to obtain a part of the sorts given in the planter's locality the fewer kinds used the better.

#### FRUIT CULTURE FOR PROFIT IN THE OPEN AIR IN ENGLAND.

By WILLIAM PAUL, F.L.S.

I THINK I may safely assume that a much larger quantity of English fruit would meet with a ready sale if put before the public in a tempting state. I think I may also assume that there are thousands of acres of land in Great Britain at present bringing little or no profit to owners or occupiers, which if planted with fruit trees, might be made to return a good profit to both. Not that I think large fortunes are to be made by the venture, but a fair remuneration for the outlay of capital, and the application of industry and skill.

To give these opinions a practical application, I propose to say a few words on the subject under the following heads:—1, Climate; 2, Soils; 3, Holdings; 4, Sorts.

##### 1. CLIMATE.

A mild equable climate free from sudden changes of temperature, and storms of wind or rain should be taken in preference. I do not believe in planting Apples, Pears, Cherries, and Plums in the bottom of valleys. This is often done on account of the quality of the soil. But it is of little benefit to the grower to realize a good growth and abundant flowering if his crop is destroyed in the flowering state by the spring frosts. Over the last few years there has been a wonderful show of blossom on the fruit trees in the valley of the Lea, but little fruit has followed owing to the destruction of the embryo by the severity of the spring frosts in this low situation. This is the one point in climate that would seem to render it unsuitable for culture for profit, as it can be but partially amended by shelter or any other means.

It seems to me that many important points desirable to secure success, are well known to those who are thoroughly versed in these matters but which have not yet taken hold of the general mind, and till they do this they cannot be too often repeated. Only a few years ago I was surprised to meet with an orchard newly planted in the bottom of a moist valley, the climate of which in spring was trying in the extreme for early buds and blossoms. The sorts, too, were indifferently chosen. Nevertheless the

planter persevered with their culture, until he found that for three or four years in succession he got plenty of blossom but little or no fruit. He has recently destroyed them and cropped the ground with vegetables. But what a waste of time and money, and what a source of vexation and disappointment!

I believe in planting on slopes or uplands, where the spring frosts are less destructive, with distant shelter to be provided, if not already existing. If cheap, quick-growing trees are planted for shelter within a few yards of the boundaries of the plantations, at the time young fruit trees are planted, the former will afford the necessary shelter by the time the fruit trees come into bearing.

On a farm of 200 acres there may be a difference of climate that would render fruit culture profitable or unprofitable, according to the position in which the trees are planted. In the valley of the Lea I find that in some years the crop is mainly or wholly on the bottom, and in others on the top of the trees. This I attribute to the frost being more severe in the one case near the ground, and in the other at a greater elevation during the period of flowering.

## 2. SOILS.

A light or medium loam of good depth and well drained is generally accepted as the most favourable for the production of an abundance of good fruit. It matters not if it be poor, provided manure can be obtained at an easy distance or at a cheap rate. A bad soil in a good climate often yields the grower more profitable results than a good soil in a bad climate. If the ground be wet, thorough and deep drainage is an essential condition of land to be employed in fruit culture, for it improves the climate as well as the soil. Chalk or gravel would seem to be a better subsoil than clay, as the latter, especially if wet, favours the development of canker.

As to soils for the different fruits, I would prefer for Apples a medium loam; for Plums, Pears, and Cherries a light warm loam. For Strawberries a light rich loam, cool and moist, with ready access to water. For Raspberries a deep, light loam, also cool and moist. For Gooseberries and Currants a deep, strong loam. But I would not convey the impression that these soils are necessary; in well-drained soils cultivation may be safely extended even to strong or clayey loams.

Of course, the working of the soil is, or should be, much more costly than in ordinary farm operations, and the cultivation of the trees by pruning and keeping free from insects is also an item of cost in labour which must not be lost sight of. In estimates of profits lately put forward it appears to me that these facts in connection with the cultivation of trees and soil have not been sufficiently allowed for.

## 3. HOLDINGS.

It is often said one should not plant fruit trees for profit except on his own land. But this would unnecessarily limit the number of growers. A long lease, however, is indispensable. According to calculations I have made, but with which I need not trouble you, thirty years is the shortest lease I should advise anyone to plant under. If the lease be for a shorter period I think the tenant should expect from the landlord either a renewal at the same rent as before, or that his trees be taken at a valuation.

It may be thought by some that this is asking too much from the owner of the soil, but I do not think it is more than it is his interest to concede. By such concession he may secure a good tenant and a good rent, and there is ample security for his rent in the value of the trees on the soil. I will read a brief extract from a recent number of the *Sussex Advertiser* in reference to land tenure in Kent, and without offering any opinion on the course taken by the tenant, as I know nothing of the case beyond what is here stated, I think you will all agree with me that such a state of things is to be deplored:—

"LAND TENURE IN KENT.—One of the results of the unsatisfactory system of land tenure now prevail-

ing in this country is to be seen at Knockholt, Kent. The lease held by Mr. Edwin Bath, of Curry Farm, in that parish, expires at Michaelmas, and he is not allowed to renew his tenancy, nor can he recover compensation from his landlord for a valuable plantation of 30 acres of Raspberries on the farm. Consequently the extraordinary spectacle may now be seen of a reaping-machine cutting down and a steam plough following it rooting up this plantation, which has cost a very large expenditure of time and money to produce. When it is considered that the produce of the plantation in question realised in the present year upwards of £1630, and that the plantation was vigorous and in full bearing, some idea may be formed of the sacrifice of property involved."

Further: It has often struck me that the manner in which the charges on land are levied is not equitable, and is calculated to discourage rather than encourage the planting of fruit trees for profit. A few words will, I think, make this plain. A man plants fruit trees, not looking for any quantity of fruit for four years. During that period he receives nothing, or next to nothing, in the shape of produce, although rent charges on land and expenses of cultivation are going on and have to be met. Then, when his crop brings him a larger return than ordinary farm produce would bring, the charges on the land are raised. Now, it would seem only fair if the charges on land are calculated according to the value of the annual crop, the planter of fruit trees should pay nothing the first four years.

## 4. SORTS.

Of large fruits grown for profit Apples would seem to stand first, Plums next, then Pears, then Cherries. Of small fruits, Strawberries, Raspberries, Currants, and Gooseberries are the most important; Filberts may also be planted to give a profitable crop in odd sheltered spots where other fruits would not grow well. But these different fruits do not all require precisely the same climate and soil. The Apple is perhaps the least particular in these respects, some varieties of which will thrive and produce large crops of good fruit in almost any well drained soil when grafted or budded on the Crab or Apple stock—the Paradise stock I have found next to useless under field culture on the clayey soils of Sussex. There are fifteen sorts of Apples which I should plant in preference to others in my own county (Hertfordshire), having an eye to disposal of the crop, as well as to its production. They are:—Blenheim Orange, Cox's Orange Pippin, Cox's Pomona, Devonshire Quarrenden, Ecklinville, Duchess of Oldenburg, Irish Peach, Keswick, King of the Pippins, Lord Shaftesbury, Small's Admirable, Stirling Castle, Sturmer Pippin, Warner's King, and Wellington.

I can speak favourably of the Ecklinville from experiments made both in Herts and Sussex. I planted in Sussex four years ago two hundred Ecklinville apples that had been cut back as maidens to 2½ feet. The soil (a quarter of an acre) was good, and had been subsoiled 18 inches deep a few years previously. They grew well. The third year they produced five bushels, the fourth year seventeen bushels, which sold on the ground 5s. per bushel. They were planted about 6 feet by 6 feet, but strong growers might be planted 9 feet by 9 feet, and small fruits or vegetables might be grown between the trees for a few years. I estimate the expenses of planting and cultivating these two hundred Ecklinville Apple trees on a quarter of an acre of ground in 1884 as follows:—

Cost of trees, 200 at 5s. a hundred	£5 0 0
Planting and Digging	9 15 0
Four Years' Cultivation, at 1s. per year	3 9 0
Rent, Rates, &c. at 10s. per year	2 0 0
	£19 15 0

## Returns in 1888:—

Twenty-two Bushels of Apples Sold on the ground at 5s. per Bushel	£10 10 0
	£5 5 0

Next year I expect to get the outlay back, and look to the future for profits.

In exposed situations pyramid or bush trees are preferable to standards, because the fruit is not so liable to be blown down, and in large orchards, if

the trees have stems 2½ to 3 feet, sheep could run under them to feed, and thus help the returns.

Plums.—The Early Prolific, Early Orleans, The Czar, Belgian, and the Victoria are good ones. Purple and Pershore Damsons also, of which the Farleigh is well to the front, are usually a profitable crop.

Pears want a better climate and a warmer, richer, and deeper soil than Apples, and are not usually so profitable a crop as Apples. They do well as a rule on a subsoil of chalk. Of Pears, Aston Town, Eye-wood, Hesse, Williams' Bon Chrétien, Beurré de Capiaumont, and Beurré d'Amanlis are the most profitable sorts to grow in Hertfordshire; Louise Bonne of Jersey, where it will grow, and Marie Louise, where it will bear freely, are also good varieties.

Cherries like a lighter and deeper soil than Apples. The May Duke, Bigarreau Napoleon, and Kentish are good sorts.

Strawberries.—Vicomtesse Hericart de Thury, Sir J. Paxton, Elton Pine, President, Sir Chas. Napier. Raspberries.—Carter's Prolific, Fastolf.

Currants.—Black Naples, Lee's Prolific, Red Dutch.

Gooseberries.—Whitesmith, Warrington, Crown Bob, Lancashire Lad.

In selecting sorts of fruits it should not be lost sight of that some sorts flower later than others, and the blossoms of some sorts are more frost-proof than others, and thus the crop is often saved by late-flowering or frost-resisting blossoms. If I were about to plant fruit trees for profit, I should look closely to these matters in the selection of sorts. I would examine all the fruit trees, and talk to all the practical gardeners in the neighbourhood whom I could persuade to listen to me to ascertain which sorts produced the best and most certain crops in the district.

In conclusion, let me say that the grower's work is only partly done when he gathers his crops. He has to sell them. Like other men of business, he must be sufficiently intelligent, industrious, and energetic to find the best market for them, and to pack them properly, if packing is needed, or he misses the reward of his skill and labour.

## DESSERT PEARS.

### THE FEWEST NECESSARY TO SUPPLY RIPE FRUIT FROM AUGUST TO MARCH.

By W. WILDSMITH, Heckfield, Hants.

The subject of this paper was suggested to my mind by the controversy as to the reduction of the varieties of fruits—Pears in particular—that took place in one of the horticultural journals a few months since. The general tone of that discussion went to show that there was a unanimous feeling in favour of reducing the number of varieties, but to what extent opinions differed greatly, twelve being suggested by more than one writer as the maximum number of varieties—a proposition that in some respects I had a good deal of sympathy with, but the number twelve ended, so far as I was concerned, simply because I knew from years of experience that no twelve kinds that could be named by the greatest expert in Pear lore would suffice to give an unbroken succession of ripe fruit throughout the Pear season—say from the beginning of August to the middle of March. That twelve kinds might be selected that would extend over the Pear season is quite another matter. I have long had the honour to serve an employer whose favourite fruit is the Pear, and consequently have had to give special attention to it, and if one point more than another has had to be studied it is that of quality, a solitary flavourless fruit of an otherwise good variety has not unseldom been the cause of the condemnation of the variety generally. I name this to show that my experience has been gained at some cost of labour and anxiety, and at the risk of being considered egotistical I think this entitles me to speak with some degree of confidence on this matter of limitation of sorts. Every

fruit grower knows how precarious and how variable the Pear is in different soils, aspects, and positions, and no twelve kinds, however good they may be in one garden or district, will be equally so in another, even but a mile or two away, nor even in the same garden can they be relied on to be of the same excellence any two consecutive years; and it is this precariousness that I think renders it necessary to grow a goodly number of varieties. For the purpose of this paper I have closely examined the pear notes in my diary for several years, in which is noted date of gathering, of ripening, and duration, *i.e.*, time they continued fit for table, and from these notes I have compiled a list of twelve that, supposing I was compelled to grow only that number of kinds, would be likely to give me the most regular (not constant) succession of fruit. They are placed in the order in which they ripened here: Williams' Bon Chrétien, Fondante d'Automne, Beurré Superfin, Marie Louise, Thompson's, Doyenné du Comice, Glou Morceau, Winter Nelis, Josephine de Malines, Huyshe's Victoria, Easter Beurré, and Bergamotte Espere.

These twelve kinds constitute the cream of all the varieties (nearly one hundred) that are grown here, and out of the twelve there are but two that are at all liable to prove of doubtful quality, and this from a cause over which we have no control, namely, a sunless season. The two kinds in question are Easter Beurré and Bergamotte Espere, both of them late varieties, and requiring a longer season of sunshine than the others. I may, however, add that I have occasionally in a sunless season had recourse to means that has tended to make both of the kinds palatable, namely, by wrapping the fruit separately in tissue paper, and placing them in shallow baskets in a dry, warm room, for ten days or a fortnight before the fruit were required for use. And now with respect to the question of the number of varieties "necessary to ensure a continuous supply of ripe fruit." I have, after considerable deliberation, founded on the practical experience of many years, come to the conclusion that it is next to impossible to accomplish the feat with a less number than twenty-five varieties. To some this number may appear excessive, and to such I ought to explain that my experience is given from the standpoint of a private gentleman's gardener—say of a large garden—and from which liberal supplies of Pears are demanded the season through, and therefore it is necessary to have, as it were, two strings to one bow; as, for instance, if Williams' Bon Chrétien Pear run short, I ought to have Beurré de l'Assomption to supply the lack; or if Marie Louise be scarce, I must eke out with Beurré Bosc, and so on, to the end of the chapter.

I regret that I have not practically tested with how few it is possible to keep up a constant supply, but I am sure I should fail if I undertook the task with a less number than twenty-five, and the following are their names, and placed in order of ripening:—Souvenir du Congrès, Williams' Bon Chrétien, Beurré d'Amanlis, Fondante d'Automne, Louise Bonne of Jersey, Madame Trevey, Beurré Hardy, Beurré Superfin, Seckle, Marie Louise, Doyenné du Comice, Thompson's, Duchesse d'Angoulême, Glou Morceau, Winter Nelis, Comte de Lamy, Beurré Bachelier, Josephine de Malines, Winter Crassane, Huyshe's Victoria, Olivier de Serres, Easter Beurré, Ne Plus Meuris, Knight's Monarch, and Bergamotte Espere. All these are generally well known varieties in most parts of Britain—proof sufficient, I think, of their excellence; and I can vouch for their reliability for this district in respect of constant and free bearing, and their high quality.

The least meritorious in the list are:—Madame Trevey (quickly over), Duchesse d'Angoulême (gritty), Beurré Bachelier (mealy), and Ne Plus Meuris (also gritty), yet I know no other four kinds that can—all points considered—replace them. Just any one should conclude from what I have said as to the number of kinds to ensure a regular succession of useful fruit, that is all that is required to make certain of the supplies, I will undeceive them

at once by saying no. There is no fruit that gives better returns for labour expended, and none that more quickly resents the "let alone" policy that one is occasionally compelled to behold. As regards the former, nearly all our trees are grafted on the Quince, from which stock it is no exaggeration to say that we get at least double the fruit that we do from trees on the Pear stock, and high feeding is therefore a matter of necessity; but the labour of applying these manurial mulchings we place as a set-off against that of the time expended in root pruning, that nearly all trees on the Pear stock require about every alternate year, and the fruit is neither so numerous nor so well coloured, and not superior in quality. No, if good crops of fruit are expected annually, water and mulch, mulch and water, must be the order of the day all through the fruit swelling season. Those that must by reason of restricted space grow only a few varieties, and whose demands for fruit are, as a matter of course, proportionately restricted, may do something towards lengthening out the supply of ripe fruit by gathering the same variety of Pear at varying intervals of from a week to ten days. The fruit of most varieties—more especially the earlier kinds—will then ripen at similar intervals, and thus the season of ripe fruit be considerably extended. To those that have unlimited room, and can therefore grow the required number of varieties to ensure supplies, this piecemeal gathering is not of so much consequence, nevertheless I strongly advise its being done with any varieties that ripen rapidly, such as Citron des Carmes, Jargonelle, Williams' Bon Chrétien, and Fondante d'Automne.

## ON PRUNING.

BY SHIRLEY HIBBERD.

It is commonly asserted in the books, and it forms part of the faith of mankind, that pruning tends to augment the vigour of trees, and as a consequence much of the pruning that is done has in view to promote the end predicated for it. There can no longer be entertained by observant men a doubt of the fact that pruning, so far from augmenting, actually diminishes the vigour of the subjects operated on, and the one sole reason that the fact is not strikingly illustrated in the outdoor world is that Nature is generous, and accomplishes much in compensation for the injuries that are inflicted by the pruning-knife. And because Nature is generous and compensative, a certain amount of pruning may be done without harm, and as regards the objects we have in view in pruning fruit trees, with positive benefit. But so long as we keep in mind that pruning in the abstract is objectionable, we shall be careful to prune in a way to ensure a maximum of the advantage for ourselves, with a minimum of disadvantage to the trees.

Keeping this in mind, we at once compare the several forms of trees with a view to arrive at conclusions as to their relative values. For the present we will compare the standards, the pyramids, and the bushes. We must deal with them generally, and make broad comparisons, for particular cases would require particular consideration that would be scarcely possible in connection with this Conference.

We will begin with standard orchard trees that bear abundantly, as many orchard trees do. It will be observed that pruning neither augments the vigour of these trees nor does it promote their fruitfulness, for as, generally speaking, they are not pruned at all, they teach a bold lesson of the non-necessity of pruning. Now we will turn to the perfect pyramids, say of Apples and Pears, formed to an ideal model by long years of pruning and pinching. As pyramids they are perfect, being of even contour, dense with foliage, with scarcely room anywhere to allow one to thrust a hand in, and they are healthy and bright from the ground line to the summit. It has to be remarked of these compact, leafy trees that they produce so little fruit as but rarely to pay a fair return for the land they occupy. They do, indeed, occasionally present their owner with a crop, and often he is satisfied. But if we are to take measures

for increasing the production of fruit we shall rather avoid than accept trees of this form, or if we must have them we shall, having fruit in view, rather promote an open growth with room to thrust one's head in at many places, this form of tree being favourable to fruit production. We have in our collections many kinds of Apples and Pears that will not, no matter what we do for them, conform to our ideal of the perfect pyramid. It is usual, therefore to suffer these to grow as open loose bushes, and the difference between them and the pinched pyramids is seen, not only in the form and furnishing, but in their superior fruitfulness.

Pursuing the comparison, it will be observed that pruning tends to promote secondary growth that often is immature when the season closes. This growth, therefore has been obtained by a false system, and its uselessness is a proper commentary on the violence done to Nature. The perfect pyramid is for ever loaded with immature wood that earns nothing, and the density of the foliage so completely excludes the light and air from the wood that fruit-spurs are few and commonly unproductive. The free bushes that are not pruned at all, or but moderately pruned, are, as a rule, vastly more fruitful than the pyramids, and the free standards are more fruitful than either. Thus, as a matter of fact, the order of fruitfulness is in an inverse ratio to the order of the pruning; and we may conclude that the pruning-knife is a deadly enemy to Apples and Pears.

The natural growth of a fruit tree is definite and orderly, but much of our practice appears to proceed on the hypothesis that it is a matter of accident. There is sent forth a certain number of long rods. If these are cut back secondary rods appear, and by stopping these we obtain a lot of soft spray; and so on for ever. But the long rods left to themselves throw out a few side branches and form fruit-spurs the greater part of their length. In due time the fruit appears. Often, where the soil and climate favour the business, and the varieties are naturally free-bearing, the fruit may be seen to hang like ropes of Onions, while at the same time pruned trees of the selfsame sorts are thinly dotted with fruit, so that we can actually count them, which in the other case is impossible. The unpruned standards and bushes are free to follow the course of Nature, and we see them fruiting abundantly and frequently, while the pruned trees fruit scantily and seldom. The obvious lesson is that long rods, admitting light and air freely, are more serviceable than rods systematically cut back, and thereby compelled to become densely furnished, forming compact trees impervious to light and air, as compared with the free trees, that delight to display their fruits in the fullest exposure. The leading shoots, therefore, should never be shortened except for some special reason.

In the year 1876 I had the honour of reading before the Society of Arts a paper on "Fallacies in Fruit Culture." One of my objects was to demonstrate that systematic pruning and pinching of open ground fruit trees deferred and limited the production of fruit, although these operations were intended to hasten and augment fruit production. And I placed before the meeting for inspection and criticism a number of trees that I had in the first instance selected for their ugliness, but which, having for some years occupied a good soil in a suitable situation, had acquired symmetry and proportion and fruitfulness without aid from the pruning knife, one great point in the business being that every annual growth had been allowed to acquire maturity, no secondary growth being promoted by summer pinching, and no superabundance of furniture resulting from winter pruning. Some of you will remember that in doing this I exposed myself to what I may now recall as a shower of hot shot; but I live still, and repeat the story, and if another dose of hot shot is ready for me I will not flinch so much as to move my eyelids, so sure am I that common sense will at last prevail, and that it will be agreed all round that Nature has something to do with the production of fruit.

I have the consolation, however, of knowing that common sense has prevailed. The horticultural papers altered their tone on the subject of pruning from that date; practical gardeners who lead by intelligence and example saw and acknowledged I was right, and to their advantage they have used the knife less freely than formerly. Moreover, since the year 1876 we have had a succession of Apple and Pear Conferences, and their collective lesson appears to be *Magna est veritas et prevalebit*, for have we not entered on a new career in fruit culture, common sense guiding the way, because only where common sense prevails does Nature prove herself in every sense the friend of man. While we repudiate reason Nature destroys our false work and does not even stop there, for she destroys man himself, and history is in great part the record of the price that man has paid for adherence to unreason, superstition, and folly.

Amongst the many persons who have carried out my proposals, I will name Mr. James Hudson, the gardener at Gunnersbury House, who is known to you, and whose work is near at hand. He had long lamented the unfruitfulness of a collection of good varieties of dessert Pears, but he saw no way to treat them but to resort to the practice of pruning. He saw my sample trees in 1876, and from that time he allowed the trees to manage their own affairs, since when they have been constantly and abundantly fruitful. Mr. J. James, then gardener at Redles, took a similar course, and secured equally happy results. In this garden of the Royal Horticultural Society you may see collections of pyramid Pears that have been systematically summer pruned for any number of years, and have borne moderate crops intermittently. But you may also see a collection of Apple trees in the form of free bushes that have only been lightly winter-pruned to keep them somewhat in order, and they have been constantly and abundantly fruitful, and, in fact, have every year for several years past illustrated my idea of fruits displayed like ropes of Onions. In the famous garden at Calcot, near Reading, where the late Mr. Richard Webb had every year finer crops of fruit than probably could be found in any garden of similar extent in all the home counties, there was absolutely no pruning practised, the trees never made more than a moderate growth, though in land of great strength, and the fruit was of such quality that Mr. Webb took a high place in great exhibitions as well as in Covent Garden Market. When lately at Heckfield, Mr. Wildsmith pointed out some Pear trees under reverse training that proved more than ordinarily fruitful. This reverse training does not pay when it is carried out in a severe manner by the aid of the knife and a multiplicity of ligatures, for that system is a mere warfare against Nature, which can never pay. It is in this case practised in a coaxing kind of way; the trees know but little of the knife, and the long rods are brought down gently, as I suggested years ago in what I termed "pulley pruning." Many fruitful trees acquire a half-weeping habit from the mere effect of the weight of the fruit which brings down the branches. There is no merit in observing this, but there is merit in taking from the fact a lesson in cultivation. The reverse position of the branch checks growth, exposes the wood and the fruit most completely to the sun and the air, and we may say the mere fact of fruitfulness is promotive of fruitfulness; the half-weeping habit that the law of gravitation enforces on the tree exactly suits its constitution as a fruit producer. Very much of the prevailing practice in pruning promotes rigidity of growth, and compels the tree to be a mere leaf-producer.

Now to conclude. Observation and experience have taught me that summer pruning is too promotive of useless secondary growth to be advantageous; and it tends also to keep the roots in action until late in the year, when they ought to be at rest. The effort of the tree to ripen useless wood is detrimental to its more profitable duties. Prune immediately after the fruit is gathered, first cutting out all dead wood, then cutting out cross and ill-placed shoots that would interfere with the free play of light

and air, and then conceal the pruning knife lest anyone should venture to cut back the long rods, and so renew the old warfare between useless wood and useful fruit.

Pyramid trees of many sorts of Pears will acquire beauty of contour, and become regularly furnished, and will produce abundance of fruit without any pruning whatever, as I have shown by my trees that for fifteen years continuously were never touched with the knife. The lower branches of pyramid trees never bear fruit, probably from proximity to the ground and its exhalations, as well as from the low temperature that often prevails at that level. When left to form themselves or aided in quite an infinitesimal degree they remain open to light and air, and soon become well clothed with spurs that ripen perfectly and do their duty. The dense, leafy pyramids are useless in proportion to their leafiness, and very often it may be said that the free bushes and standards are useful in proportion to their leanness, and it must be owned that many of the lean trees are amongst the most profitable. Long rods pay, short rods are more plague than profit.

A most instructive contrast between the useless pyramids and the profitable standards has occurred in the garden planted many years since by my friend Mr. J. B. Saunders, then of The Laurels, Taunton, now of Teignmouth. Mr. Saunders was proud of his pinched pyramid trees, and managed them with orthodox care. They were but moderately fruitful, though models of form, and as handsome in leafage as Camellias. In the course of time, my friend having left Taunton, a portion of his beautiful garden, of which many of the pyramid trees were occupants, came into the possession of Mr. Godding, nurseryman, of that town. This gentleman soon discovered that the pyramids would never pay rent for the land they covered, and he determined that they should pay liberally, and cover no land at all. He cut them back to sheer stems of 7 to 10 feet or so, according to their form and stature, and allowed them to form free heads over the gravel walks. They have done this; he crops the borders under them to their very stems, and they arch over the walks, forming rustic bowers, and their fruitfulness is such that it is necessary to provide artificial support to save them from self-destruction. You have never seen pinched pyramids in the deplorable condition of needing artificial support.

Of wall and cordon trees I do not propose to say anything at this time, except that they must be amenable to common sense, and Nature must have some freedom even when the trees are so fettered. Of one thing I am satisfied, that any system of pruning that promotes a late summer growth is pernicious, for it is not in this climate that fruit trees can make and mature useful wood after the passing of Midsummer Day.

### CANKER: ITS CAUSE AND CURE.

By JAMES DOUGLAS, *Ilford, Essex.*

This troublesome disease in fruit trees has very frequently been the subject of discussion in the gardening periodicals and elsewhere. Nearly every gardener has had to deal with it in his experience of the details of fruit culture, and as I had considerable experience of it some twenty-five years ago, in an old Essex garden, I may at least claim to bring it forward as a subject for discussion.

At the outset it may be taken for granted that it is absolutely necessary to ascertain the cause of a disease before any attempt can be made to find a remedy. The late Mr. Robert Thompson, author of the *Gardener's Assistant*, and Superintendent of the Royal Horticultural Society's Garden at Chiswick, writes on canker with considerable diffidence. In the work above cited, p. 381, he says:—"The cause of canker is imperfectly understood, and so, consequently, is an effectual remedy."

His idea of the causes of canker, as summarised in his admirable work, are:—

1. Sudden checks to the vegetation of the tree, especially in spring and the early part of summer.
2. Derangements of the flow of sap, from vicissitudes

tudes of heat and cold, as well as of moisture and dryness.

3. Unskilful and severe pruning.
4. Vitiation of the sap by deleterious substances in the soil or subsoil.
5. Dryness at the root doubtless gives rise to a species of canker, which manifests itself on the younger branches and on the shoots.

Referring also to Lindley's *Theory of Horticulture*, p. 110, it is stated that a Mr. Reid, of Balcarra, has shown "that one of the causes of canker and immature fruit, even in orchards, is the coldness of the soil." He found that in a cankered orchard the roots of the trees had entered the earth to the depth of 3 feet; and he also ascertained that during the summer months the average heat of the soil at 6 inches below the surface was 61°; at 9 inches, 57°; at 18 inches, 50°; and at 3 feet, 41°. He took measures to confine the roots to the soil near the surface, and the consequence was the disappearance of canker and perfect ripening of the fruit.

Another cause has been suggested, viz., insect agency. But this view of the matter will probably not be sustained by practical gardeners generally. That insects of various kinds, including that troublesome pest, American blight (*Aphis lanigera*), will penetrate into the cankered part for shelter, is likely enough. Indeed, I can assert they do; but they are not there as the cause of canker, but because the cankered part affords a secure resting-place, which the smoother, healthier portion of the bark does not. Indeed, I can also assert that cankered trees may be found in the garden with insects upon the affected part, and others near them also cankered with no insects upon them.

My contention is that canker is caused in two ways, and affects two different parts of the trees. Perhaps the most serious disease is that which affects the trunk or larger branches of the trees. This I hold is caused by the roots pushing downwards into cold, undrained, or unsuitable soil. The other aspect of the disease is that which lays hold of the twiggy portion of the trees, for even the one-year-old shoots do not escape. The immediate cause of this is probably owing to the rupture of the sap-vessels by frosts, when the sap is in an active state. But I have a firm belief that the primary cause is also to be found in the condition of the roots, which, being in an inactive state owing to unsuitable soil, or their penetration to a great depth, prevents the perfect ripening of the wood, or maturation of the blossom-buds in the autumn.

I come now to my own experience in our old garden twenty-five years ago. There were upwards of one hundred trees of various sizes, some only a few years old, others a hundred years planted at least. Most of them were cankered, and in places where the old trees had been removed and young ones planted, canker showed itself in a few years.

The soil was light, over a gravel subsoil, and was naturally drained; the water did not stand on the surface for any length of time, even in very wet weather. I was confident that want of drainage had nothing to do with it, and that the fault was in the cultivation. Young trees seldom do any good planted amongst old ones, even if the soil has been well dug up and enriched with manure where the roots are to be placed. They require a wider and better field for their ramifications. I found I had to make gravel paths as well as fruit borders, and as most of the old trees were on the wane, and the young ones of but little value owing to their cankered state, it was thought best to remove them. But they were not all removed at once, as it was necessary to keep up a supply of fruit for household use. A space about 30 feet wide was lined off through the whole length of the garden, and was cleared of all trees and bushes. In the middle was a space 6 feet wide for a gravel path. The borders on each side, about 12 feet wide, were trenched, where possible, 2 feet deep, and we found the gravel cropped up in places within a foot of the surface. Where this was the case the gravel was taken out and used to make the path, the soil from the path being used to fill up

the space from whence the gravel was removed. A good dressing of decayed farmyard manure was worked in with the operation of trenching, and as we could obtain good clayey loam, a barrow-load of it was spread out over 2 square yards, and 6 inches below the surface; a thin layer of decayed manure was placed on the ground before the loam. This was easily done as the work proceeded; one man could wheel in the loam and manure to two at work trenching.

When the work was finished we had a good gravel path with Box edging on each side, and the borders, through the trenching and manuring, were about 8 inches higher than the surrounding ground level. I had to plant the trees soon after the trenching was finished; they were Apples, Pears, and Plums on various stocks, and in considerable variety. We planted them but 6 feet apart at first, and when they were planted a portion of good decayed turfy loam was placed round the roots. With this treatment, as might be expected, the trees made good clean growth even the first year.

As we manured rather too heavily by placing in two layers of fat stuff, I thought it best to retrench the ground the next year, lifting the trees as the work proceeded. I found they had made a mass of fibrous roots into the loam, and when the trees were replanted again quite another barrowload of loam was placed round the roots, but no manure this time. However, round the roots of each tree some decayed frame manure was placed, to keep the frost from them.

The trees made good clean growth again, and formed plenty of blossom-buds. But I found 6 feet was too close even for Apple trees on the Paradise stock, and they had ultimately to be removed from 9—12 feet apart. In the course of the next ten years other borders were made, and in some cases the trees which were too close to each other were thinned out to furnish them. Many of the old cankered trees remained in proximity to the young ones for quite ten years, and with some two or three unimportant exceptions none of the young trees cankered. This shows, I think, if the disease has been caused by insects they might have travelled from the old diseased trees to the young ones. It was some seven or eight years before any canker appeared, and then only on the Dumelow's Seedling, or Wellington. These trees were lifted, the canker cut out, and they were replanted again with fresh loam under and over the roots. The cut out portions soon healed over, and I saw no more of the disease.

The object I had in view was to encourage the roots up to the surface, and to keep and feed them there. The entire border quite close to the surface was full of roots, because it was not dug over, but merely scratched with a fork or hoe; and during winter and summer there was a thin layer of manure over it. Within the borders were the kitchen garden squares, well manured, to be cropped with vegetables, and the roots ran into this freely. We were well within the London fogs, being less than seven miles from the Bank of England. In our new garden, not much further out, we had to do the same sort of work, but the soil was much better, being medium clay of considerable depth, and nothing more was necessary than to trench the ground twice over, in order to incorporate the top and bottom soil well together. We had to drain it, and find a good outfall for the water. In such a case the drains should be about 6 yards apart.

I have brought this subject forward as much in the interest of amateurs who own small gardens, and who do most of the work themselves as a relaxation from sedentary occupations, as in that of gardeners. It is quite true that some classes of soils are more suitable to fruit culture than others, but my experience is that some soils are condemned when neither the soil nor the climate, but the culture alone, is to blame. Only the other day I met a person who has several hundreds of fruit trees in his garden, most of them young ones, and a considerable proportion are showing canker on the larger branches. I examined the soil, and found that it had not been

broken up more than 10 inches deep; and, further, all sorts of vegetable crops were planted close up to the trees. This system of culture can satisfy no one, and it cannot be profitable. I fancy many good gardeners will bear me out when I say that want of preparation of the soil and subsequent neglect of the special requirement of each class of trees is the sole cause of canker.

Having found a cause, I would suggest the remedy. In the first place it may be remarked that heavy clay soils nearly always require to be drained, and a free outfall provided for the water. Three feet depth of drains is sufficient, with a main drain at the lowest part of the garden 8 feet 6 inches deep.

Secondly, trenching, or at least stirring, the soil to a depth of about 2 feet is necessary. But I would not invariably throw the subsoil up to the surface, but would always stir up the bottom to the depth of 8 or 9 inches with a fork, and if the soil could be trenched twelve months before planting all the better.

In the third place good healthy trees should be selected; they ought to be carefully lifted, and planted as soon afterwards as possible. Care must be taken to keep the roots in a moist state from the time they are lifted until they are again in the ground. Spread the roots out carefully when planting them, and work the soil well in amongst them. Trees on the free stocks should be planted the same depth as they were before. Those on the Paradise and Quince stocks, or, in fact, any dwarfing stocks, should be planted to the union of the stock and scion. It is also of great advantage to the trees to have a mulching of decayed manure around the roots after planting, and if they are exposed to high winds they ought to have some artificial support until they are well established.

Lastly, as to the pruning and training. I seldom do any pruning in winter. It is a more pleasant occupation in summer, and is a very simple operation, merely consisting in thinning out the young wood when it is too much crowded, and pinching off the points of any vigorous young growths that are likely to run out too far for the others. If they grow too much, it is easy to dig round the circumference of the roots, and to underneath to sever any roots that are running directly downwards. This will be enough to throw any tree into bearing. To allow a fruit tree to form a thicket of wood in the summer, and then to cut it all off in the autumn, is the right treatment for a pollard Willow, but will not do for fruit trees of any kind. There should be more reverence for life in the mind of the pruner than for such reckless pruning to be possible.

It is quite time that a better system of fruit tree culture should be adopted in small as well as in large gardens. Why should amateurs purchase fruit when they can grow it themselves, and have all the pleasure as well as the profits? It is useless to sit down and blame the climate, the soil, or anything else, when the real cause is a bad selection of varieties, or bad cultivation. Let the old worn-out cankered trees be rooted out from old gardens, and their places filled with approved sorts likely to do well in the neighbourhood, for each district has its special varieties.

Preparation of the ground by trenching and manuring is necessary, and whether the soil is light over gravel or a clay soil over heavy clay, the results will be satisfactory, and justify all the expenditure.

#### CANKER IN FRUIT TREES.

By EDMUND TONKS, Esq., B.C.L., Knowle, Warwickshire.

I HAVE been requested by Mr. Barron to contribute a paper for discussion at this meeting, and as the results of some experiments recently made by me appear to indicate that there may be a remedy for that worst of all diseases affecting fruit trees—canker, which is described in the *Herefordshire Pomona* as "the terror of all orchardists and the bane of most orchards," I thought it right to comply with the request. As my own experience scarcely extends beyond my garden, and numerous duties have prevented me from devoting even there that close and

continued observation which is necessary for the proper study of such a subject, I should have hesitated to intrude my crude notions in antagonism to the authorities if their views had been clear and definite; but as these are very vague, both as to the cause and the cure of the disease, I venture to state my own. Thompson, in the *Gardener's Assistant*, says:—"The cause is imperfectly understood, and so, consequently, is an effectual cure;" Mr. Fish, in *Cassell's Popular Gardening*, says:—"In fact it may almost be said to be incurable;" and the *Dictionary of Gardening*, the most recent publication on the subject, says:—"Were the causes better known, the remedy might generally be much easier found." Yet these, and most of the other writers on the subject, according to my ideas, indirectly indicate both the cause and the remedy for the disease, the cause being mal-nutrition, the consequence of an imperfect provision in the soil of the food required by the plant; the remedy, the supply of the food which is deficient. These writers inferentially indicate this remedy: for instance, Thompson recommends that "the soil be ameliorated, by trenching and other means;" Mr. Fish, in *Popular Gardening*, says:—"Lift the roots into higher places of warmth, and better and more immediately available supplies of food;" and the *Dictionary of Gardening* says:—"Trees that are badly cankered may be improved by lifting and replanting in improved or better drained soil."

Perhaps the most convenient method of dealing with the subject in detail is to analyse, paragraph by paragraph, all that is stated relating to canker by some recent and recognised authority; that splendid work, the *Herefordshire Pomona*, is possibly the best for the purpose, as it may be assumed to contain a summary of the most recent knowledge of all that relates to orchard growth. The first paragraph of the passage in that work relating to canker states that "it is always due to direct injury." In a controversy a clear and definite issue is most satisfactory, therefore with all submission I venture to assert that it is never due to such cause. That canker may appear in parts which have been injured is no proof that the injury caused the canker, although the injury may determine the particular spot where the disease makes itself visible. A well nourished and consequently healthy tree may be injured to any extent without development of canker, while an ill-nourished tree, or, to avoid begging the question, a tree infected with the disease, will develop in all parts the external signs without the slightest injury or abrasion of any kind, and very frequently on parts where, from their well-protected position, such as the angles of the branches with the main stem, it is almost impossible that injury could take place. The coincidence of canker and an injured part is no more proof of the former having been caused by the injury than that a hole in a building through which the flames of a conflagration are first visible is the cause of the fire.

The second paragraph states that "weakness is at the bottom of the canker." This weakness cannot be want of apparent vigour of growth, for I have frequently observed trees attacked which for a number of years have made the strongest growth, yet the disease has appeared before any external signs of weakness were visible, the very vigour of the growth in some cases appearing to hasten the attack in a soil containing too limited a supply of the necessary food, as that supply is sooner exhausted, and the time arrives when the large tree can no longer find within reach of its roots sufficient for its maintenance. It may be that only one element of food is failing, but every element is indispensable for perfect growth of the whole tree, and that failure would fully account for arrest of growth in parts, weakness and consequent disease.

The third paragraph is "the tree is old." This may be expressed in other words—the tree has for a long time been growing in the same soil. It is not difficult to realise that in the course of many years a tree may exhaust the most fertile soil. Many seem to overlook the necessity of restoring to the soil what is taken away year after year by large crops of

fruit. However rich the soil may have been originally each crop takes away a definite quantity of the food required by the tree, until in time insufficient remains; then the tree fails, not through age, but through inanition. The same gardeners who leave their fruit trees unfed would think it most unreasonable to expect them to grow their crops of vegetables without manure.

The fourth paragraph is, "or the variety is very old or very delicate." This raises the much-vexed question whether a seminal plant has a finite life, or one which can be prolonged indefinitely by propagation. Experience seems to prove that individual life has a limit, though there is evidence that many seminal plants have a very prolonged existence; however, the limits of this paper do not allow the present discussion of the question. It may be sufficient to say that observation does not lead me to believe that the age or delicacy of a variety renders it more like to canker when the soil contains what it requires.

The fifth paragraph suggests "that the soil is not sufficiently drained." Canker, according to my observation, occurs equally on well-drained as on ill-drained soils; it is not a question of condition of roots. My own garden formerly contained several trees rapidly succumbing to canker, which, when grafted with other varieties, at once put on healthy growth, made fine heads, and have since for many years been perfectly free from the disease. Each variety requires its own appropriate food; Strawberries afford a very good illustration of this. I have among my friends the reputation of growing this fruit to perfection, yet I had the greatest difficulty in finding varieties which would do fairly in my soil, and after trial of many more than a hundred, have so far discovered only about half-a-dozen which are moderately successful. British Queen refused to fruit; Dr. Hogg bore fairly as an annual, but did not survive to the second season—in fact all the Queen race and many other kinds only do more or less ill. Such being the case, it is not unreasonable to believe that some varieties of fruit trees find in some soils what they require, while others do not, and in consequence become subject to canker.

The sixth paragraph is, "or it (the soil) may be too poor." I quite agree with this, as I believe a deficiency in the soil of the necessary food of the tree is the cause of canker.

Seventhly, "The wood may be weak, and is not well ripened, when a sudden frost, especially after rain, ruptures the vessels, and this forms the chief cause of canker." Unripe wood, which is, however, often the result of imperfect nutrition, is productive of much mischief of a temporary nature; but as canker attacks well matured wood, I cannot believe it to be in any case its cause, although when the real cause is at work it may appear on such wood.

In the eighth paragraph the author repeats himself. "Any direct injury, however, to the bark of a tree, as from friction of one branch upon another, the pressure of a clothes' line tied from tree to tree, or injury from a ladder in fruit gathering, may all cause it, even in healthy trees." This calls for no further reply than that given to the first paragraph.

Finally, the author states that "Canker commences with an enlargement of the vessels of the bark, more apparent, by the way, in Apple than in Pear trees, and continues to increase until, in the course of a year or two, the albumen dies, the bark cracks, rises in large scales, and falls off, leaving the trunk dead, and ready to break off with the first wind if not before removed." The canker shows itself quickly, and if the cause be sought for it will often admit of a remedy. The most usually effective is a good supply of nourishment to the trees affected, together with the removal of the parts injured." I confess that the preliminary symptoms described as the enlargement of the vessels of the bark have escaped my observation; but there appears to be some contradiction in the statement, as while the first symptoms of the disease are described as extending over a year or two, further on it is stated that canker shows itself quickly. However, although I

differ so much from the writer of the article in the *Poona* as to the causes of canker, we are agreed on the remedy, namely, "a good supply of nourishment to the trees."

In 1886 my attention was specially directed to plant food, having been requested to write a paper on that subject for the Birmingham Gardeners' Association. In the same year, having noticed that a number of Apple trees in my collection had become unsightly through canker, I marked about a dozen of them for destruction; but while studying the subject of plant food, which involved the consideration of the analysis of various plants, I was very much struck with those of the fruit and wood of the Apple in Wolf's *Aschen Analysen*, the great authority on plant analysis. I found that the fruit contained an exceptionally large proportion of soda and the wood of lime. This at once suggested the idea that my soil might not contain sufficient of one or both of these elements to supply the wants of the Apple tree; therefore I resolved, instead of destroying the marked trees, to give them and all my Apple trees a good dressing of a complete artificial manure which contained full proportions of soda and lime. In the following season, 1887, which was exceptionally hot and dry, either through the drought, the manure, or some other cause, not a spot of active canker could be found; all the edges of the old wounds on the marked and other trees, almost as badly affected had put out granulations and healed over, and the trees, many of which had previously ceased to extend, made healthy and vigorous growth. Last winter the trees were again dressed with the same manure; this season they have been exposed to the most unfavourable conditions; the soil to a great depth was almost dry when they were making their first growth, while an army of caterpillars ruined what foliage was made. Then followed the most continuous cold weather and rain experienced for many years. Notwithstanding conditions so conducive to the extension of disease, there is at the present time still no appearance of active canker. The trees have been carefully inspected by some experienced pomologists who, doubtless will confirm my statement. Short as is the time during which the trees have been submitted to the treatment, I can only conclude that the arrest of the disease is due to the supply of elements of food required by the trees, of which a sufficient quantity was not previously contained in the soil.

The food required by a plant is a complicated mixture of many elements, all of which are necessary for its well-being; the complete absence of one of them would be fatal; a deficient supply of one would arrest its development, and render it subject to disease. Nothing is more instructive and conclusive on this point than the copies of photographs of plants grown for the purpose of testing the effect of manures more or less complete to be found in treatises on the subject. That of *Ville on Artificial Manures*, published by Longmans, contains many such illustrations, which clearly show that when the soil contains every element of fertility but one it remains absolutely barren. For instance, in a soil without potash, the Vine makes no growth.

It remains to say that the manures necessary to restore a tree to health vary as the soils, although the ashes of the wood of the Apple tree contains 71 per cent. of lime—an exceptionally large quantity—it would not be necessary to supply this element on a lime formation; nor would soda be required in a soil near the sea, although on other geological formations or situations a deficiency of one or both may be the cause of canker. Like conditions apply to the other elements.

Various soils require such manures as will supply their various deficiencies; but as it is most difficult to ascertain even by analysis what may be the deficiencies of a soil, the practical way of dealing with the subject is to study the analysis of the ashes of the plant in question, and to use a manure which is composed of these elements; for instance,

The ashes of the wood of the Apple tree contain:—Potash, 120; soda, 16; magnesia, 57; lime, 710;

iron, 0; phosphorus, 46; sulphur, 29; silica, 18; chlorine, 0.2. And those of the fruit:—Potash, 35.7; soda, 26.1; magnesia, 8.8; lime, 4.1; iron, 1.40; phosphorus, 13.6; sulphur, 6.1; silica, 4.3; chlorine, 0. Ville lays down the rule that soils generally contain sufficient of all the mineral elements except potash, lime, and phosphorus, and the gaseous element nitrogen, and says it is only necessary to supply to the soil manures which contain these four. This may be sufficient for the general purposes of cultivation, but more recent experiments have conclusively proved that the addition of a small quantity of iron largely increases the development of foliage, and consequently of the plant. In dealing with a mysterious disease such as canker, I should not leave out either iron or magnesia.

The following formula, which may be varied as circumstances require, is suitable for the Apple tree:—

Superphosphate of lime	...	...	12 parts.
Nitrate of potash	...	...	10 "
Chloride of soda	...	...	4 "
Sulphate of magnesia	...	...	2 "
Sulphate of iron	...	...	1 "
Sulphate of lime	...	...	8 "

This may be used at the rate of  $\frac{1}{2}$  lb. to the square yard over the whole extent of soil within reach of the roots. It need not be dug in; one effect of the manure may be relied on, if it does not cure canker it will, at any rate, most certainly benefit the trees.

I hope you will excuse me for having questioned some of the conclusions of great horticultural authorities, but it seems that some of these conclusions have been accepted, without sufficient examination, as being time honoured traditions handed down through many generations. Gardeners are, in this respect, perhaps a little too conservative.

I think much may be learnt by occasionally departing from these traditions and making independent experiments in cultivation; my own experience proves that many such experiments resulted in failures, but there is full compensation if only one useful discovery be made, or one error exploded.

## RENOVATION OF OLD AND FORMATION OF NEW ORCHARDS IN THE WEST MIDLANDS.

By W. COLEMAN, Eastnor Castle Gardens.

FIVE years having passed since the Royal Horticultural Society inaugurated the first comprehensive Apple Conference, the present Council has wisely decided upon testing the result of that important step by again calling together those interested in Pomology. A small minority at the time thought the exhibition of thousands of plates of Apples would not benefit the growers, but the consumers also. Since that time the growers' prospects have not improved, owing, they say, to the prevalence of low prices brought about by gluts and foreign competition. Buyers, on the other hand, say the supply is unevenly and irregularly distributed, and the price is too high when they purchase from the retailer. Growers say fruit culture will not pay until the land each man holds or occupies is as good as his own, or let to him on a very long lease, indeed; but present owners of the soil somehow do not seem to see the force of their argument, consequently the most important work the present gathering has before is the framing of a scheme of open markets in which consumers can buy first hand at fair remunerative prices. This is all very well, but supposing each householder is in a position to buy Apples say, from day to day, where are those Apples to come from? Why, we must import them. Actually, we must trust to the Colonies for the produce of a tree which is indigenous to our soil, whilst thousands of acres of land capable of producing the finest fruit is going out of cultivation. To the Royal Horticultural Society should attach the honour of taking the initiative in working out this problem, but before the body can move we must learn from reliable men the progress which has been made in the great fruit-growing districts. Living as I do in the county of

Hereford, boasting its 27,000 acres of orcharding, where in days gone by thousands of tons of good fruit was lost, wasted, or converted into indifferent cider, I am able to form a pretty correct opinion of our own progress, and although less rapid than I could wish, I may say it is fairly satisfactory. Cider drinking amongst the working classes since I first knew the county has gradually decreased, consequently small parcels of the rosy Tom Putt and other useful Apples, alike good for cooking or vintage, are now stored for daily use by all the members of the grower's family. If not wanted, then they are sold to dealers, who make a profit, for conveyance to retailers, who also make another profit, and that a heavy one from their customers. Although a slight step forward, this state of the case is not quite satisfactory, neither will it be until a powerful fruit-growers' association, which should be the outcome of this Conference, has established a network of markets in all provincial towns as well as in London markets in which producers, as in all parts of Paris, can meet face to face with consumers without the aid of so many middlemen. In fruit growing counties, like Hereford, Worcester, Gloucester, Kent, Devon, and Somerset, these local markets should be well supported, as we gather from statistics that three-quarters of a million of money is sent out of England annually for Apples alone. If land-owners, hitherto blind to their own interests, and legislators now take up the matter, I see no reason why growers should not go forth to the production of an article which the public must and will have, and so keep the money at home. Our climate is all that can be desired for the growth of fresh crisp fruit, not quite so highly coloured or so large as picked samples from the Colonies, but large enough to command top prices when well grown, and packed, and properly marketed. There must be no shaking from the trees, but the cream of the crop must be hand-picked, and honestly packed as firsts and seconds. The residue or refuse, which added to the best would increase expenses and pull down prices, would then remain at home for various purposes.

Mr. Knight, the great physiologist and hybridist, who worked so much in Hereford and Salop, proved by analysis that some soils, even in these favoured counties, were preferable to others for producing Apples of dense gravity, and full of saccharine matter. The late Dr. Bull, of whom Hereford should be proud, following in his wake, corroborated all that Knight had said, proving, I think satisfactorily, what past generations of shrewd men had found out for themselves, both as regards the quality of the fruit and the constituents of the soil which should be chosen for Apples, also for Pears. The conclusions at which they arrived were these: The light thin soils will not grow the best Apples; therefore, those who would plant a successful orchard, must choose a deep, stiff sandstone loam, if they have the opportunity of doing so. All the orchard land in this county is not alike good; indeed, some is very bad; but the soil here, as in Devonshire, which produces the best fruit, owes its fertility to the plentiful supply of lime from the marl or cornstone; to its great depth and sustaining nature. Scientists who will, may peruse the first part of the *Herefordshire Pomona*, or they may follow Mr. Rivers through his exhaustive address delivered at the Crystal Palace (see p. 289), but my remarks, necessarily brief, will guide plain practical planters to the best spots for new plantations.

Having been honoured by an invitation to contribute a short paper upon the Apple, I have determined to confine myself to the West Midland orchards, in which, I am pleased to repeat, some progress has been made since the first Conference was held in 1883. Draining, grubbing, grafting, and planting are still going on, but much remains to be done before we can invite inspection. Although the Apple is a long-lived tree, and perfectly hardy in all its parts, save its flowers, the occupants of many of our oldest orchards, crippled by age, bad usage, and neglect, are past recovery, and should be cleared away; but the ground they occupy should

not be replanted if better or equally good sites can be found for new plantations. Other orchards, again, containing thoroughly sound young trees, although of inferior sorts, after the grubber's axe has passed over the land, may be converted by grafting, and resuscitated by draining and top-dressing. Some of our oldest orchards, which date back to the Wars of the Roses, contain a great number of windlings, or kernel fruits, of no value to the owners even; whilst younger plantations are crowded with healthy, vigorous trees, at one time supposed to be Norman, but now proved to be English seedlings, no better than the stocks used in large nurseries. Upon the first I would not spend money, as they are too old for grafting, too old to pay rent, too old for anything save loss and disappointment. The second I would behead, and regraft with choice varieties which have been proved in the locality. Confining myself to old orchards now existing or languishing in the Western Counties, I may close my remarks upon this head by saying, Cut down all useless trees, thin out the heads of those worth keeping; cleanse the branches and stems from moss and insects; regraft sound, healthy trees into good market sorts, and see that the drainage is satisfactory. I will not presume to inform practical men who may deign to read my remarks that sound, deep, naturally drained orchards are better than others which require artificial treatment, and that a certain quantity of moisture in the soil is absolutely necessary, but on no account must it be stagnant. All gardeners are well acquainted with the fact that soils too dry produce fruit that is small and mealy, whilst waterlogged soils are several degrees colder than others of similar texture that are free from this root-chilling poison. They know, moreover, that warm summer rains run off the surface, whilst the sun acts very slowly in raising the temperature of the wet subsoil in which deeply seated roots soon perish, and those nearest the surface are little better off, as they do not commence fresh action much before midsummer. Drainage, all good cultivators assert, is the first essential in the preparation of new orchards or in the renovation of old ones, and why?—well, simply because the removal of stagnant, if not putrid, water and the introduction of fresh air raises the temperature of the soil from 3° to 5°, a condition which not infrequently forms the dividing line betwixt success and failure.

So far my remarks have been confined to old orchards, planted haphazard upon all sorts and conditions of badly-prepared land, as well as in unfavourable situations. The best of these may be retained for a time, upon the principle that half a loaf is better than no bread; but the majority of them must go, and young ones must spring up before we can hope to realize an average £10 an acre, or compete with the colonists in our own markets. Some years, as many present know, have passed since horticulturists commenced agitating, but the good seed which was intended to put three-quarters of a million of money into the British farmers' pocket for a long time fell upon stony ground. Some recently has taken root, and far-seeing landowners are now putting our theory into practice by offering land upon conditions that will induce capitalists to invest in fruit culture precisely as they do in coal and iron. In this and the adjoining counties good landlords are raising and distributing to their tenantry Apple and Pear trees by thousands. These mostly are standards on free stocks, the only class of tree suited to pasture and arable land. Nurserymen, again, who have brought propagation up to a fine art, are producing standards and dwarfs by the million, and these surely in a few years should make their mark. Meantime a complete network of markets, I insist, must be created throughout the kingdom.

From the preceding remarks, those who run may gather the fact that I do not set much value on the thousand of acres of ragged, decrepit, moss and lichen laden trees, but until the new plantations come into bearing we must make the best of them. Then, with Gladstonian vigour, we may hew them down, and let the Apple-sick sites go back to Hops, corn,

and pasture. Upon this principle change of site may be worked precisely as gardeners now manage their Strawberry plantations, and with similar results. I venture to say, one acre of modern orcharding will beat ten of the old—at least in the West Midland counties.

Already I am afraid my paper is too long, but having warned to my subject, I should like to say a few words upon the formation of the modern orchards I might divide them into several parts, such as aspect, site, soil, preparation, planting, the best style of tree manuring, mulching, pruning, and protection, gathering, storing, packing, and marketing, but my time being limited, my words must be brief and general.

Aspect and site being so closely dovetailed together these I will not attempt to separate. All gardeners, I believe, are pretty well agreed that a south aspect is best, as trees in this position ripen their wood well, and produce fruit of the highest colour and quality. The Apple, however, being perfectly hardy, the quality of the soil must not be lost sight of; neither must altitude and shelter from north and east winds be repudiated. Under these circumstances, the soil being deep sandstone loam resting on marl, and naturally drained, I should not object to a point east, or any other aspect round with the sun to fall west. The latter, however, I should prefer, and for these reasons: although western gales in this part of the country do some damage, it is well known that if plants are exposed to the first rays of the morning sun when they are frozen they will suffer, but if they are shaded until they are gradually thawed by the rising temperature of the air they will stand a few degrees with impunity. An orchard open to the east or south-east is almost sure to suffer after an attack of spring frost when in full flower or setting, whereas one with a western aspect, which does not receive the sun until the temperature has risen and dispelled the frost often sets and carries full crops to maturity. Hardly a year passes in which the gardener does not find early crops of all kinds are safer and finer upon west borders than upon others; therefore, I think, few will deny that his experience is of great value to the planter. The site, I may say, should be above the line of fog, and it should not be too near or on a level with water. If naturally drained much time and expense will be saved, otherwise this operation must be well carried out as a preliminary to preparation. This may be performed in two ways, viz., by trenching two spits deep for pyramids or bushes, or by taking out large circular stations on grass or arable land, for standards. If trenching is decided upon, the bottom spit, if heavy and inferior, should not be brought to the surface, but it may be ameliorated by the addition of burnt clay from the drains, by road scrapings, or any other fresh friable material short of rich animal manure. This, unless the staple be very poor, I would keep back for use as a mulch after the trees are planted. On all ordinary loams young trees grow fast enough at first, but the time comes when they must be fed, otherwise they cannot be expected to yield, year after year, fruit of the finest quality.

In the preparation of stations for standards on grass or tillage ground I would throw off the top spit 9 feet in diameter, break up the bottom, and throw out clay or bad material to be carted away or burned. If cold or at all unfavourable to root-growth, exposure of the soil for a few weeks or months would greatly improve its quality. Otherwise, after correcting the bottom spit, that thrown off first, turf included, with anything in the way of road-scrappings or old lime rubble added, may be chopped in until the hole is quite full, or a little above the general ground level. A stout stake should then be driven down to the solid bottom, as a support for the tree when planted.

Planting may be performed at any time from the beginning of October up to the end of April. Autumn, however, is best, as the roots at once take to the soil and the trees make a fair growth the following summer. October and November undoubtedly are the best months—that is, provided the land is in

perfect condition and the weather favourable; but so important is getting the trees into the ground when it is fairly warm and dry, that I would rather defer planting until April than risk placing the roots in a pasty medium. Trees of home growth, that is, from one's own nursery, which every fruit grower should have, may be planted much earlier than others brought in direct from a distance. All trees should be carefully divested of faulty or injured roots by a clean cut with a sharp knife; they should never be allowed to become dry, and each root and fibre should be spread out in a horizontal position, lightly covered, and watered home.

In the arrangement of trees, the rows, if convenient, should run from north to south, or north-east to south-west, as three out of the four sides then receive an equal share of sun and light. The old fault of planting them too close should be carefully guarded against, as good fruit cannot be expected when the heads grow into each other and the roots are constantly shaded. Standards of upright-growing varieties may be placed 30 feet apart each way, whilst 40 feet will not be found too much for spreading trees like Flanders Pippin and Blenheim Orange. Trees, again, of one variety, or a similar habit of growth, and which ripen their fruit at the same time, should be kept together, or in rows, alternating with others of a spreading or upright character. By observing this rule at the outset the general and orderly appearance of the nursery will be greatly improved, and much time and labour will be saved when gathering the fruit. The same rule applies also to pyramids and bushes which, by the way, should have plenty of room for extension in every direction, as no extensive planter can afford to prune close home upon villa garden principles, especially when the best of the fruit is cut away by the process. Thinning the shoots and branches annually of course is necessary, but beyond this and maintaining the balance by tipping a gross shoot, I should let each tree go. The distance apart will depend upon the kind of stock, as trees on the French Paradise may be grown for years at distances of 4 to 6 feet apart each way. On the English Paradise or Doucin, which I like best, they grow stronger; consequently more room is required. Twelve feet from row to row, and 6 feet from tree to tree, will give them room for a long time, but eventually it may be necessary to transplant every alternate tree, when those left will stand equidistant, viz., 12 feet from stem to stem. Some I know plant much closer, but when it is borne in mind that a well-developed head turns off not only more, but better fruit than a small one, abundance of room is a decided advantage. Moreover, plenty of space favours a spreading growth, which keeps the heads near the ground, safe from wind and easy of access for pruning, manipulating, and gathering. When standards are planted they should be well secured to the stakes previously driven, but in a way that will allow them to settle with the subsiding soil, otherwise the roots will drag and strangle. If on pasture land, they should be well protected from sheep and cattle, and the orchard itself must be fenced and wired round to keep out hares and rabbits.

*Varieties.*—The only point I must now venture to touch upon is the selection of varieties for special soils, situations and purposes. A few years ago we planted very early sorts for coming in before the American importations, but this is now over, as the quick run, and summers hotter than our own combined, enable our friends to be abreast of us at the beginning, as for a long time they have been at the end of the season. Our only way out of this dilemma, as I have before observed, is high cultivation. We have a climate which ripens fruit crisp, tender, and juicy, not quite so highly coloured, perhaps, but in my opinion superior to the general run of American. We have the soil which, thanks to yearly tenancies, nobody cares to till; and we have the ability. All we want is quality, then it matters little whether we market early or late, always provided we confine ourselves to a few of the best sorts which do well in the locality. This hackneyed phrase for a long time

puzzled would-be growers, who said, "Where must we look for anything better than a Suffield or a Blenheim?" Well, I am not sure that anyone requires anything better, but if they do, they must just look into any of the great well-known nurseries about the end of September, and there they will find thousands of trees of all the leading kinds carrying fruit of the highest quality. Some of these on dwarfing stocks—just the thing for the garden or home nursery—will be loaded with large, bright fruit, of which at the present time we ought to have 100,000 tons ready for storing. They will find also standards on free stocks specially prepared for planting on pasture and arable land. From these they may select scores or hundreds of trees of one sort, and so on of another, but on no account must they select one or two trees each of a hundred sorts, as this plurality is a great drawback to commercial culture. Very early sorts generally go direct from trees to the market; medium and late sorts must be stored in dark, cool fruit-rooms or dry cellars, and this accommodation, or the want of it, must be the guide in making a selection.

Gathering, storing, and marketing hitherto in the Western Counties has not received proper attention; but a great improvement is now taking place, and the day, I hope, is not far distant when ruthless shaking the boughs will be looked upon as a barbarous custom of the past. Apples worth growing are worth hand-picking, and when hand-picked they are worth sizing—that is, dividing into two classes before they are stored or sent to market. The best only should be sent away; seconds may be retained for home use, or consumption in the neighbourhood. There should be no mixing of sorts, or good and bad together, but one uniform quality should prevail. Buyers in this part of the country still stick to their pots. I do not mean earthenware, but wicker, which hold from 5 to 7 pecks each; but invariably they sell by weight, and this, I think, is the fairest way, as anyone can compute the value of a ton of Apples. Before Apples are hand-picked for storing they should be ripe, that is to say, the kernels should be brown and somewhat loose in their cells. The fruit, moreover, should be perfectly dry and free from spot or blemish, as one black sheep soon demoralises the flock. Once put away the less they are turned or handled the better, especially when sweating or during frosty weather.

If the store-room is fitted with lath shelves, the choice varieties should be placed one, or at most two layers, thick, but late sorts grown in great quantities may be laid upon dry floors in greater bulk. They may be stored also in dry flour-barrels, which should be labelled and put away in a low even temperature for the winter. Good aristocratic store-rooms are rather expensive; but a cutting driven into a dry bank and covered with thatch, with double doors at one end, will make a store equal to the best and most elaborate in the kingdom. Resinous wood should never be used in the manufacture of shelves; neither should hay or straw be admitted within the walls; as all these materials impart a disagreeable flavour. Dry Fern, on the other hand, may be used for covering purposes, but very little of this will suffice where frost, and more especially heat-proof, stores are properly constructed.

## APPLE AND PEAR GROWING IN JERSEY.

By CHARLES B. SAUNDERS.

THE island of Jersey, being so noted for the growth and cultivation of fine fruit, especially Apples and Pears, I venture to offer a few remarks upon the modes of culture and the varieties cultivated, thinking they might be acceptable to the committee, and also to the general body of horticulturists interested in the production of these health-giving and palate-pleasing fruits.

Jersey being the most southerly of the group of islands in the Bay of St. Michael's, and the slope of the land being from north to south-west, enjoys a very favourable climate; the general moisture, owing to its position and the saline air, which almost

always may be felt blowing over its surface, renders it peculiarly adapted to the growth of Pears. The soil is a good loam upon a substratum of clay retentive of moisture, which suits the Quince stock, upon which most of the Pear trees are budded or grafted. There are localities along the coast of which the soil is much mixed with sand, owing to the continuous drift in stormy weather, whilst some parts of the western side of the island are so much exposed to the Atlantic Ocean as to be entirely unfit for fruit culture, and scarcely worth cultivating, the cereals and root crops growing upon them being very often subject to serious injury from the force of the westerly gales. Now it is easy to understand why the most protected and best sheltered situations are selected for the growth of the finest and best kinds of fruit. Apples are grown on the higher and drier parts of the island, where the land is stiff enough and the drainage good; hence the orchards, where the more ordinary kinds are grown for the manufacture of cider and general consumption, are generally surrounded by hedgerows from 5 to 8 feet high, and planted with Elm and other descriptions of forest trees. The Apple trees in these orchards are generally grafted 6 feet from the ground, and have spreading circular heads, which are perfectly beautiful when in bloom. Very many of us can recollect when the Weigels of sorts were first introduced, that their great recommendation was that they were as "beautiful as Apple blossoms." Were not Apple blossoms beautiful before then?

These orchard trees, which make such a beautiful display of flowers and produce in favourable seasons such an abundance of fruit, are much neglected, and allowed to grow in a confused mass of branches. To scientific horticulturists it seems a pity that, where Nature does so much, man should do so little in the way of pruning, so as to give the trees a more regular form and better appearance. You will, I think, agree with me that judicious pruning—i.e., removing weak and superfluous branches—would have the good effects of improved appearance, more healthy growth, and finer fruit. The general character of the growth is so vigorous as to render it unnecessary to prune the extremities of the shoots, except for the sake of shaping the trees and balancing the heads, but "thinning out" is the style of pruning requisite.

The finer descriptions of Apple fruit are grown in gardens sometimes against the walls, on espaliers, or on the long cordon system. The dwarf cordon is not much practised, nor is it desirable, inasmuch as the growth, in spite of the Paradise stock upon which the trees are usually worked, becomes so strong that it requires constant cutting back to keep it within the desired limits, and this constant repression of growth is not conducive to fructification.

The finest Ribston Pippin Apples are grown upon south walls in sheltered gardens, trained upon the fan system—the strong radiating shoots being selected to form the frame of the trees, and the lateral and weaker branches being pinched and pruned off, so as to get fruit spurs to form. It is an excellent system, barring the disadvantage of the early maturity of the fruit. Very few other sorts are thought worthy of wall culture. The dwarf bush, the open standards, the rider or tall standard trees are all acceptable forms of garden trees, where the space is sufficient; and such varieties as Early Stibberd, Red Astrachan, Lord Suffield, Hawthornden, Red Quarrenden, Hooper's Seedling, Downton King, Golden and Walton Pippins, Grand Alexander, Cox's Pomona, and Orange Pippin, 'Court of Wick Pippin, English and Dutch Codlins, &c., are grown freely on Paradise as well as other stock, and take but little space. It is not unusual to see crops of fruit considerably above the weight of the trees producing them. Planting Paradise stock Apple trees in rows 6 feet apart, and the trees at 3 feet apart in the rows, suggests a system of culture which might be made remunerative, and were it not for the constant changing of tenants from one piece of land to another, might be advantageously practised. It is

(For continuation, see p. 448).

Advertisers are specially requested to note, that, under no circumstances whatever, can any particular position in the paper be guaranteed for advertisements occupying less space than an entire column.

Now ready, in cloth, 11s. 6d.

## APPOINTMENTS FOR THE ENSUING WEEK.

### MEETINGS.

TUESDAY, Oct. 23 Royal Horticultural Society: Fruit and Floral Committees.  
WEDNESDAY, Oct. 24 National Chrysanthemum Society: Floral Committee.

### SHOWS.

WEDNESDAY, Oct. 24 Royal Botanic of Manchester: Apples and Pears (four days).  
THURSDAY, Oct. 25 Exeter Apples and Pears.

### SALES.

MONDAY, Oct. 22 Dutch Bulbs, at Stevens' Rooms. Dutch Bulbs, at Protheroe & Morris' Rooms. Nursery Stock, at Mr. C. Noble's, Sunningdale, by Protheroe & Morris (six days). Nursery Stock, at the Grove Park Nursery, Lee, by Protheroe & Morris. Dutch Bulbs and Lilium auratum, at Small & Co.'s Rooms.  
TUESDAY, Oct. 23 Nursery Stock and Greenhouse Plants, from sample, at Protheroe & Morris' Rooms. Golden Eucynemus and Young Conifers, at the Wood Lane Nursery, Isleworth, by Protheroe & Morris.  
WEDNESDAY, Oct. 24 Dutch Bulbs, at Stevens' Rooms. Lilium auratum, African Tuberoses, Lilies, and other Plants, at Protheroe & Morris' Rooms. Azaleas, Lilies, and Dutch Bulbs, at Small & Co.'s Rooms.  
THURSDAY, Oct. 25 Dutch Bulbs, and Lilium auratum from Japan, at Stevens' Rooms. Dutch Bulbs, at Protheroe & Morris' Rooms.  
FRIDAY, Oct. 26 Duplicate Plants from the Collection of F. G. Tatler, Esq., at Messrs. Protheroe & Morris' Rooms. Azaleas, Dutch Bulbs, and Lilies, at Small & Co.'s Rooms.  
SATURDAY, Oct. 27 Dutch Bulbs, at Stevens' Rooms. Dutch Bulbs, at Protheroe & Morris' Rooms.

The Fruit Congress.

In spite of the many and sore reverses that the Royal Horticultural Society has had to endure, there is still an amount of vitality in it which if properly directed by those at the head of affairs, must lead to ultimate and permanent success. The magnificent display of Apples and Pears that has this week been made in the Society's gardens at Chiswick, brought together without fee or reward, from all parts of Britain, must surely have convinced the Council that the Society has only to continue in the course it now appears to have embarked on—namely, that of carrying out a strictly horticultural policy—to receive the unwavering support of horticulturists generally. The opening of the exhibition on Tuesday was decidedly a red-letter day in the annals of the Society, not only by reason of the number and quality of the exhibits, but also for the fact, that President and Council were present in full force; once again, after many years of neglect, the head-quarters of the Society was really visited by its President and Council, all of whom, it is to be hoped were so impressed with the enthusiasm that their invitation to exhibit had aroused amongst fruit growers generally, that future laxity of duty, so far as regards visits to Chiswick, are at an end.

With regard to the special aims of both exhibits and Conference, namely, the extended and improved cultivation of Apples

and Pears, as a means of profit and an auxiliary to agriculture, horticulturists of all grades are in entire sympathy. To avoid disappointment and failure it may, however, be necessary to warn those not conversant with fruit culture, but who, enamoured by the sight of many hundreds of dishes of splendidly coloured Apples, and but slightly inferior Pears, may be inclined to embark in their cultivation, that this show of Apples and Pears is something above the average standard of excellence that they may themselves annually expect to realise. Dissent from this opinion is sure to be rife, in presence of the extremely unfavourable season we have passed through. It will be argued, "Surely, if in such an exceptionally cold and sunless season so high a standard has been attained, it is only reasonable to expect that at least as high a rate of excellence will be possible in the average of seasons." This is a great fallacy; first, because every dish shown contains selected fruit of the particular variety; and secondly, because not a few of the collections have many dishes of fruit that have not been grown in the open air at all. What renders the exhibits of this section the more misleading is, that the exhibitors have, in most cases, not taken the trouble to state that the examples were the products from glass structures. This is a serious error, and one that, in all future exhibitions, should be avoided, by the adding of a class, or classes, for orchard-house fruit. There is one other respect in which it is possible that some intending planters may be misled, and that is, in respect of the varieties of Apples and Pears best adapted for certain districts. For instance, the schedule asks for 'twenty-four varieties of Pears best adapted for the exhibitor's district. A difficult demand in any season for the largest grower to comply with, and specially so in this year of scarcity of this fruit in many parts of the kingdom; and to the credit of the exhibitors only two or three have attempted the task. At the time of writing we have not seen the jurors' awards, or commendations of the most meritorious exhibits or varieties; not do we know what the readers of the various papers may have to say on this head, but we should prefer the decision of either body, rather than any collection that has been got together under such unfavourable weather conditions as have prevailed this year. On the other hand, it may, with truth, be asserted, that fruits that have turned out well in such a season must of necessity do so in more favourable seasons, and if production—i.e., growth of fine fruit—were the *fiat*, we should not have a word to say against this view of the matter. But we require, not only well grown and handsome, but long-keeping fruit, and the keeping powers can only be had by plenty of sun-heat.

Both Exhibition and Conference are undoubtedly calculated to do great good, and it is with a view of making this good a permanency that we have thought well to allude to one or two of what we consider the weak points of this matter.

One result of the Conferences of 1883 and 1885 is conspicuously apparent at the Conference ending to-day, namely, that of the correct naming of the fruit, there being very few wrongly named exhibits, either amongst Apples or Pears. Add to this the fact that fruit cultivation has been taken up by, and is largely on the increase amongst farmers, as well as professional growers for market, and that at least a part of this increased activity in fruit cultivation—bad season and notwithstanding—may safely be credited to the influence of former Conferences. These are results

that may well stimulate the Council of the Royal Horticultural Society to continue their present line of policy till the numerous special societies that have sprang into existence owing to previous apathy shall have been merged into an indissoluble because a united society.

This action of the Society is of the more importance at this juncture, as its operations and its decisions will, and deservedly, secure an amount of credit with the general public which other associations got up merely for private ends, however legitimate, can never do. No one doubts that the increased cultivation of well selected fruit, carefully grown, and judiciously marketed—if we may coin the word—will be of material benefit to the depressed agriculturist, and especially to the small cultivator; but to hold out the promise that fruit culture is to be an *El-Dorado*—"the salvation of British agriculture"—is to raise hopes that can never be realised in this, or, indeed, in any other country.

**DRAGON TREES IN MADEIRA** (see Supplementary Sheet).—The garden with the Dragon trees shown in our illustration is in the environs of Funchal, and is known as the Quinta do Til, that is, the country-house of the Oreodaphne fetsens, one of the native Laurels, the stump of an old tree remaining in the ground. The curious but uncouth Dragon tree, a near ally of the Lilies, is also an indigenous plant but so few wild specimens are left on the island that they may almost be counted on the fingers of one hand. Trees are, however, to be seen in several gardens, the finest being at The Mount, 1800 feet above Funchal, but there is not one that approaches the age of the venerable tree that grew at Orotava, in Teneriffe, and was blown down in a storm in 1868. A branch of this celebrated tree is preserved in the Museum at Kew, and the tree itself was illustrated at p. 713, June 9, 1888. The house in the illustration was erected some three generations ago by one of the British wine merchants, who planted it on a large scale, intending to build a palatial residence. But bad times came, and only a part of the design was carried into effect. There is a tank in the grounds to which a melancholy interest is attached, for in it the statesman CANNING's only son, a captain in the navy, was drowned whilst bathing. Our illustration, as also the one that preceded it, was taken from a photograph obligingly communicated by T. HARCOURT POWELL, Esq.

**FRUIT DRYING INDUSTRY AT PORTICI.**—We have received the following notice for publication from the Agricultural Department, Privy Council Office, 44, Parliament Street, Westminster, S.W., dated October 13:—

"Sir,—I am directed by the Lords of the Committee of Council for Agriculture to inform you that an intimation has been received from the Italian Government that the Exhibition of Fruit Drying Industry, which was to have taken place at Portici during the month of September last, has been put off until September, 1889.—I am, sir, your obedient servant, C. L. FREL."

**THE UNITED HORTICULTURAL BENEFIT AND PROVIDENT SOCIETY.**—On the 13th inst. the annual dinner of this Society took place in the Cannon Street Hotel. There was a large attendance of members and visitors, with Dr. Hogg in the chair, and H. J. VITCH, Esq., in the vice-chair. The Chairman, in proposing prosperity to the Society, pointed out that the Society is not a provident and charity Society, but a trust Society, in which the surplus funds are divided among the members, and invested for them in stocks. The funds of the Society consisted of three different accounts, viz., the benefit or sick fund, out of which payments were made to sick members, who in order to enjoy this advantage need not of necessity be totally incapacitated from work. Then there was the management

fund, which is used to meet current and office expenses, &c.; and lastly the benevolent fund, out of which grants were made in cases of unusually heavy doctor's bills, and such like cases. He urged that persons wishing to aid the Society should give to the management fund. This was responded to by Mr. N. COLE, one of the oldest members of the Society. H. J. VEITCH, Esq., proposed kindred societies, saying that the one helped the others all round, and did not by any means clash. Messrs. R. CUTLER and G. DEAL replied. Mr. J. WRIGHT, in speaking for the Trustees and officers of the Society, said that the weakness of the organisation was in the management fund, and that the best way to aid the Society was by assisting this fund, which would enable the Society to make itself better known than it was now. Messrs. WHEELER, CHARD, and COLLINS replied. It was announced that Dr. HOGG had made a donation of £12, and that Mr. SHERWOOD had become a life member. The evening was pleasantly passed, and the proceedings were enlivened by ably rendered music under the direction of Miss MARIE BELVAL, the ladies of the party being presented with handsome bouquets. The tables were tastefully decorated by the kindness of Messrs. LAING, CANNELL, CHARD, and others.

**NATIONAL AURICULA SOCIETY: NATIONAL CARNATION AND PICOTEE SOCIETY.**—The annual general meeting of the above Societies will be held in the room of the Horticultural Club, Hotel Windsor, Victoria Street, on Tuesday, October 23, 1888, at 4 P.M. precisely. The business of the meeting will be, the election of officers and committee, receiving the Secretary's and Treasurer's reports, the election of judges for the ensuing year, and any other necessary business as may pertain to the annual general meeting.

**NATIONAL CHRYSANTHEMUM SOCIETY.**—In order to add to the attractions of what is now the great Chrysanthemum show of the year, which is to take place at the Royal Aquarium on November 7 and 8, a large space within the building will be devoted to horticultural sundries, including model greenhouses, hot-water appliances, manures, &c. Applications for space have to be made to the Hon. Secretary, Mr. WILLIAM HOLMES, Frampton Park Nurseries, Hackney, E.

**"THE ORCHIDEENNE."**—The first meeting of this newly-established Society for encouraging the culture of Orchids among amateurs, was held on the 11th inst. in the exhibition-hall of the "Horticulture Internationale," Brussels. In spite of the unfavourable weather, eighty-five species and varieties were exhibited. The jury consisted of M. DE LANSBERGHE, Chairman; Secretary, M. WALLAERT; and MM. MASSANGE DE LOUVREX, F. KEGEHAN, and others. A Diploma of Honour was awarded to M. LINDEN for *Catasetum Bungeorthii*, with twenty-three flowers on two spikes. First-class Certificates to M. PEETERS, for *Odontoglossum vexillarium superbum*; Chevalier LUIGI MODIGLIANO, for *Cypripedium Sanderianum*; M. VAN HOTEN, for *Masdevallia chimera*; M. MASSANGE DE LOUVREX, for *Cypripedium vexillarium*; Count DE BOUSSIES, for *Vanda Sanderiana*; M. MASSANGE DE LOUVREX, for *Cypripedium expansum*; M. LINDEN, for *Oncidium crispum* miniatur; J. O'BRIEN, for a collection of dried flowers of various species of *Disa*, *Satyrion*, &c., from South Africa; E. VERAET & Co., for cut flowers of *Cypripedium Harrisonianum superbum*; M. MITCHEL, for cut flowers of *Miltonia Moreliana*. Second-class Certificates were awarded to M. LINDEN, for *Oncidium varicosum* Rogersii; PEETERS, for *Cypripedium expansum*; MOENS, for *Laelia Perrini*; PEETERS, for *Cypripedium regale*; and a Second-class Cultural Certificate to M. MOENS, for *Oncidium phymatocellum*.

**THE FUNGUS FORAYS.**—We have received accounts of the doings at the Woolhope Club meeting and in the New Forest. On both occasions the weather was all that could be wished, but the supply

of fungi in Herefordshire was but scanty. When our readers have digested the fruit served up to them in such profusion, there may be a chance of a hearing for the fungi. In any case, we are compelled to postpone the record of the meetings in question.

**ANAGALLIS PHILIPPI, Hort.**—This is, says Mr. Lynch, one of the very best of blue-flowered annuals. It flowers all summer and produces a flower in the axil of every leaf measuring more than an inch across, of cobalt-blue colour. The plant is procumbent in habit, with strong ascending branches which are four or five angled, bearing lanceolate leaves, opposite below but in whorls of three or four above. The peduncles are longer than the leaves, sepals linear-lanceolate, corolla rotate with finely erose margin, filaments clothed with rosy hairs. The base of the corolla is also rosy, but without lessening the intense blue of the floral mass. DE CANDOLLE says the plant is perennial, but in the Cambridge Botanic Garden it is annual. It is referred in the *Prodromus* to *A. collina* (var. *f. ceruleis*), and it is also the *A. Monelli* var. *Willmoreana* of *Bot. Mag.* t. 3380, which figure precisely represents the plant, but without demonstrating its ornamental character.

**FRUIT CULTURE IN IRELAND.**—The following letter, addressed to the Lord Lieutenant of Ireland, has been handed to us for publication:—

"What strikes me most painfully in Ireland—except in parts of the semi-Scotch province of Ulster—is the remarkable absence of those accessories to agriculture, which are indispensable to the success of small holdings everywhere. I do not here allude to the flax industry, peculiar to north-eastern Ulster, but to fruit-farming and market-gardening. Had Mr. GLADSTONE's famous big Gooseberry growing remedy for the depression of British agriculture been specially addressed to Ireland, he would undoubtedly have been on the right track.

"For, in Ireland alone, the economic conditions necessary to its success, already prevail, viz., farms so subdivided as not to afford a comfortable maintenance, except on the intensive, or market-garden system of cultivation, together with the prevalence of abnormally large families. In the wives and deft-fingered children of the 300,000 impoverished so-called farmers, below £10 valuation, you have ready at hand, and crying out for employment, an abundant supply of the personally-interested and delicate labour, required for sowing, thinning, transplanting and gathering the finer kinds of vegetables and all bush fruit.

"The mild and moist climate of Ireland, where sufficient sun heat cannot be relied on for ripening the larger kinds of stone-fruit, is peculiarly favourable to the free growth of Currants, Cherries, Raspberries, Gooseberries, Fibberts, Walnuts, and fairly adapted to Strawberry, Apple, Pear and Damson culture.

"Most kinds of vegetables will do well everywhere in Ireland, and her warm and moist south coast might rival the Channel and Scilly Isles in the production of early Peas, Potatoes, Seakale, Broccoli and Rhubarb. The finer kinds of vegetables are unaccountably scarce at all times in Dublin, where two-thirds of the fruit consumed is not grown in Ireland.

"Not only should Ireland grow all the fruit and market-garden produce she needs for her own consumption, but with her early springs and her weather open to Christmas, she ought to supply the teeming populations of the north of England and Scotland with both early and late garden produce.

"Dairymaking, of course, is a main feature of Irish farming; but it, too, in the case of the smaller holdings especially, should be combined with fruit-growing. Every farmhouse everywhere, of whatever sized holding, should have an orchard attached.

"Now that the Irish farmer has no longer anything to fear from confiscation of his improvements, he has only himself to blame if he does not turn his land to better account. But he still needs two things, namely, skill and enterprise—the inestimable inheritance of the foreign peasant, who beats him in the British market.

"If the present generation of Irish farmer is well nigh hopeless, much may be done with the next, and it seems the most obvious duty of the State to take the matter in hand.

"Were half an acre, or even a rood, of garden ground, for the purpose of the practical application of the science taught within, attached to every country school in Ireland, and the produce of the scholar's labour allowed, as a requisite of the school teacher, an immense impulse would be given to gardening in Ireland. Horticulture, in my opinion, rather than agriculture, is practically adapted for teaching in connection with the national schools. The same teacher, at suitable times and seasons, can both theoretically and practically, teach gardening both to boys and girls, whereas it seems obvious that practical farming instruction can only be imparted in connection with a farm—an impossible adjunct to all but a few schools, and requiring a special farming instructor.

"To teach farming there should be at least one counterpart of Glasnevin in each province, and I venture to think that the existing 5 acre farm there, which at present really illustrates nothing in particular, should be made a model of what a 5 acre farm should be for an industrious peasant to get a living out of, in illustration of the combined method of gardening and farming suggested above.

"Although I have here only dwelt upon the most obvious and universally possible accessory to farming, I fully recognise the necessity for promoting every feasible form of home industry in Irish villages, such as wood-carving, basket-making, joinery, lace-making, embroidery, knitting, straw-plaiting, &c., to eke out the family income, and employ idle hands during the long winter evenings. W. H. (Bullock) Hall, J.P."

**HORTICULTURAL CLUB.**—The first dinner and *coversation* for the session 1888—1889 took place on Tuesday last, October 16, at the new rooms of the Club at the Hotel Windsor, Victoria Street, Westminster, when there was a very large attendance, including Mr. John Lee, Chairman; the Rev. W. Wilks; the Rev. F. H. Gale; Messrs. H. J. Veitch, J. Veitch, Strange, Walker, J. H. Pearson, C. Pearson, A. H. Pearson, Bunyard, Rivers, Drury, Girdlestone, Goldring, Morris, &c. The subject for discussion was Peaches, and was opened by a very interesting paper by Mr. T. Francis Rivers. A discussion took place afterwards, in which Messrs. Lee, G. Bunyard, H. J. Veitch, Pearson, Goldring, and others, took part. A vote of thanks was given to Mr. Rivers, and the Secretary announced that at the meeting in November, Mr. George Bunyard would read a paper on November and December Pears; and in December Mr. Charles Pearson one on the Chrysanthemum. Unqualified approbation was bestowed on the new arrangements for the Club, and a very agreeable evening was spent.

**BRITISH FRUIT GROWERS' ASSOCIATION.**—The executive committee appointed at the first Conference, held last month, submitted at the meeting at the Crystal Palace on Thursday last a draft constitution, which stated that the objects of the Association would be to promote the profitable culture and the improvement of fruit in the United Kingdom and to facilitate the distribution to consumers. The Chairman (Mr. T. F. RIVERS) said the inception of this Association was wholly due to Messrs. GORDON and CASTLE, who a few months since began the organisation of a society which, he thought, had succeeded in drawing the attention of the people of England to the important fact that a large and lucrative industry was being silently withdrawn from our country, to the great advantage of those who had skillfully taken advantage of our apathy and indifference. The United States, Canada, Australia, and New Zealand were all on the alert to supply our markets with a commodity which they were supposed to be unable to furnish. Were they to sit with folded hands and allow this to be done? Were they to complain that their inability was owing to landlords, land laws, railway rates, or middlemen? In his opinion they had nothing to do with it. The profits derived from judicious fruit-cultivation were sufficient to cover the moderate and fair rents now asked for land. The real and fundamental cause was ignorance, not arising from want of intelligence or energy, but from the fact that no organised society, school, or college had ever undertaken seriously to teach the methods by which fruit-cultivation might become successful.

The State spent a large sum on botanical gardens with the most useful result, but it did not at present give any encouragement to an industry which was of serious importance to the land. One of the aims of their Society would be to draw attention to this omission, to rectify their past errors, and to place pomology in the rank which it should take as a science of high economic value, instead of being regarded as harmless and rather twaddling. The other aims and objects of the Society would be to invite discussion, to hear papers, and to organise meetings in different parts of the country, in order that a special knowledge of pomology might be diffused as widely possible and intending planters furnished with information which would lead to success instead of failure. Mr. J. WRIGHT read a paper on "Profitable Fruit Farming," mainly Gooseberries, giving an interesting account of how they were grown on the fens of Lincolnshire on an extensive scale, and with great success pecuniarily. Mr. D. TALLEMAN read a paper on "Practical Fruit Growers' Associations," in which he pointed out that fruit, was at present very little cultivated in any county in England and said that in four-fifths of the kingdom, more particularly in those districts which were in proximity to large industrial centres of population, so far as fruit-production was concerned, the soil was a barren waste. If the desire of the founders of the Association were successfully obtained, it would simply revolutionise the existing condition of fruit cultivation and the course of procedure that the fruit cultivators of the United Kingdom had hitherto followed. Foremost among the subjects on which fruit-growers required information stood the economical production of early and late crops. In no way could such large prices be obtained in fruit-growing as by early production. Foreign produce which reached our shores from the South of France, Italy, and the Mediterranean, early in the season, not only made long prices, but also took away the edge of the taste of the paying public for fruit. With Practical Fruit Growers Associations formed and at work in all parts of the kingdom this condition of things would not last, and sooner or later our fruit-growers would produce early fruit that would successfully and profitably compete with anything that could be imported from abroad. The question of scientific irrigation would also repay the Society for any attention which might be bestowed upon it.

## ORCHID NOTES AND GLEANINGS.

### RODRIGUEZIA (BURLINGTONIA) FRAGRANS.

This charming Orchid, a native of Brazil, appears to be better known on the Continent than in this country, where it is not often seen. The name is included in the catalogue of some continental nurserymen, and a figure appeared in the *Orchidophile* in 1884. It is flowering now at Kew, and is conspicuous by the beauty and Hawthorn-like fragrance of its flowers. The pendent spikes carry about ten flowers, each flowers being  $1\frac{1}{2}$  inch in length. The sepals and petals are of a glistening white, slightly tinged with purple on the outer side; the lip is deeply bilobed, and fringed at the margin; it is also white, with the exception of a few lines of yellow on the centre. The habit of the species is that of a large *R. secunda*.

When growing, this Orchid like a warm, atmosphere, and a free supply of water at the root. Even in winter water should only be withheld in accordance with the lessened amount of light and heat, as it requires but little rest. The plant under notice is growing in a basket of sphagnum, and carries four spikes. *W. Bean.*

### LELIA PERRINTI ALBA.

A large specimen of this chaste autumn and winter flowering Orchid, in whose large pure white flowers no trace of colour exists saving a faint sulphur-yellow tinge in the middle of the labellum, is now in flower in the collection of R. H. Measures,

Esq., at The Woodlands, Streatham. The plant in question has fourteen flowers, and was obtained from Messrs. F. Sander & Co., of St. Albans, with a warrant that it has quite borne out. White Perrinitis are often heard of, but on examination the white has more or less of pink in it; however, in this case there is not the slightest suspicion of colour, and in size the flowers are equal to the best type. *J. O'B.*

### CATTLEYA HARDYANA.

A specimen of this rare natural hybrid between *C. aurea* and *C. gigas*, with over one hundred bulbs and ten leads, now bears several spikes of gorgeous fragrant flowers, apparently exactly the same as the original plant, is in bloom with R. H. Measures, Esq., at Streatham. The plant was a lucky speculation, it being bought unfloored as *C. gigas* variety out of an importation of Messrs. F. Sander & Co. In the Woodlands collection, also, a specimen of the beautiful *Oncidium undulatum* bears sixty-eight expanded flowers; *Cymbidium elegans* has eight spikes carrying over three hundred blooms; and a large number of rare *Cypripediums* are in flower and bud. *J. O'B.*

## SEASONABLE NOTES ON HARDY FLORISTS' FLOWERS.

THE AURICULA.—At p. 67 I wrote of gathering seeds, sowing them, and finishing off the reposing of the plants. We did not finish off the work of potting until the end of August, and now the plants are all much alike, whether they were repotted by the end of May or the end of August. The plants are all in cold frames at present, and it would be desirable to have cold weather, with frost at night, as it prevents flowering. In the warmer South the Auricula has a greater tendency to bloom unseasonably than in the North; but much can be done to check this by careful attention to watering the plants. In a general way the plants get too much water in the late summer months, when they ought to be allowed to become dry at the roots before being watered, and certain varieties—even in summer—may not require water more than once in a week. I saw the admirable collection of the Rev. F. D. Horner's choice show Auriculas at Lowfields, Kirby Lonsdale, in the last days of August, and there was no signs of any autumn bloom; he does not have 5 per cent. of it. From there I went on to Sheffield, and saw Mr. Simonite's collection at Rough Bank, and found his plants at least ten days in advance of Mr. Horner's. Both growers raise many seedlings every year, and have many distinct new varieties on trial. I noticed in Mr. Horner's garden a large bed of seedlings planted out in the open garden, and sheltered from hot sunshine with some thin material, scrim or tiffany. These are usually planted in pots about the end of August, and are placed in frames. Planted out-of-doors in this manner they do not require so much attention as they do in pots. Most of the plants are eighteen months old from the time they appear above ground until they produce their flowers.

The young seedlings should now be kept in a dry, airy place, and they ought not to be watered very frequently; but must not be allowed to become dust dry. When water is needed give enough to thoroughly moisten the soil, and do not water again until they really need it. The old plants in frames lose their leaves (the outer ones) very rapidly since the frost set in, and these should be removed frequently, as a decaying leaf will sometimes cause the death of a valuable plant. The plants are not quite free from greenfly, but this troublesome pest does not increase much if at all at this season; but it can hold its own even when the plants are exposed to frost. It is best to fumigate with tobacco-smoke when the weather is mild. They can also be brushed off with a soft brush dipped into tobacco powder, so that those insects not brushed off are killed.

Alpine Auriculas in frames require very similar treatment to the show section when they are grown

in frames, and out-of-doors they lose their leaves very rapidly at this season. Slugs are troublesome creatures, and it is well to look over the plants, clearing away the old spent soil from around the plants, replacing it with fresh compost.

### THE CARNATION AND PICOTEE.

Layered plants and rooted pipings are now being potted off or planted out for the winter. If the latter have been managed as I advised at p. 67, they will now be sturdy plants, and as good as the layered ones, as regards some varieties. Carnation growers need not be taking all are equally free in producing roots. I began taking off the layers from our mother-plants in the last week of September, and finished the first week of October, and found them quite as well rooted this year as in any previous year; but there are always a few which cannot be said to have formed roots at all; but they will, as a rule, speedily produce them in a hotbed where there is just a gentle bottom-heat. The pots should be plunged to the rims in cocoa-fibre refuse. The bulk of the plants intended to be grown in pots are now in cold frames, freely exposed to light and air; in fact, as soon as the young plants are fairly established the lights are taken off, except during frost and heavy rains. The plants do not require much water, but they must nevertheless not be kept too dry. We treat the yellow Carnations and Picotees in a similar manner to the others, as they are equally hardy, and grow even more vigorously, whether they are planted in beds or grown in pots.

### TREE OR PERPETUAL FLOWERING CARNATIONS

are now very useful, and should be placed in a house or pit where they may have a gentle heat afforded them, and if the plants are near the roof-glass the flowers will open very freely. I may say that although the flaked Carnations and Picotees have made excellent growth this year, the tree Carnations, on the other hand are rather weakly. They have not the strong healthy foliage of ordinary years, but doubtless they will improve with care. The seedlings of various types are likewise less vigorous. Very heavy rains came soon after they were planted out, and hardened the ground so much that we had to carefully fork it over with a hand fork. The growth made in September was fairly good, but I fear that many of them are not strong enough to flower.

### THE DAHLIA.

The plants were cut off very suddenly this year; but, fortunately, the rain has kept off, and it being a fine drying day on the 10th, I had my collection taken up. It is fortunate when an opportunity is afforded to get the roots out of the ground in good condition soon after sharp frosts. As they are taken up, the stems are first cut over, some 3 or 4 inches from the surface of the ground. The roots are then placed in the sun for an hour or two with the tuber uppermost, to drain the water from the hollow stems, placing them afterwards in any house or shed which has a dry atmosphere and is also frost proof. Even with the greatest care, a few tubers will be lost each year, but if it is possible to have a few pot roots of each variety, these are more likely to pass safely through the winter, especially in such a season as this, where the plants have had a bad season, as well as a short one to ripen in. Pot roots may be kept in a greenhouse laid on their sides under the stage, or in any house from which frost is excluded.

### THE HOLLYHOCK.

I fear we shall not get much seed from the plants this year. The flowers were produced late, and we had not gathered a pod when the first frost came. Last year was a good one for seeds ripening out-of-doors, but this one is just the reverse. If it is intended to winter the plants in frames they should now be taken up and potted, or the frames may be made up with some fine loam and leaf-mould, and the plants set out. I find in our exposed district the plants live out-of-doors through the winter if

they are sheltered from the north and east winds, but where exposed to the full force of the winds we lose a great many each year. The small plants, in pots, propagated from cuttings or single eyes during the summer, ought to be placed in cold frames. It is as well to plunge them to the rims in some loose material. They require at all times ample ventilation, but ought to be shut up close at night, as one cannot tell what the weather may be before morning. *J. Douglas, Great Grearics, Ilford.*

## HOME CORRESPONDENCE.

**BORDER CARNATIONS.**—A new interest has of late been created in these Carnations, and now everybody wants to grow them in gardens, not for exhibition purposes, but as ordinary border flowers. We have also recently begun to discover that there are far more good kinds, especially of self-colours, in the country than we had imagined; and now in all directions good varieties are being presented, so that there is abundance to choose from. Last year being dry and hot proved peculiarly fecund of seed in good sorts, and myriads of seedlings have been raised this year in consequence. This year seed will be scarce, but a good seed season every few years suffices to keep seedlings abundant. Happily, too, kinds which are robust—and none others are for ordinary border culture worth saving—soon give plenty of layers, and in a few seasons any one variety may be largely multiplied. It has occurred to me that a good trial of these border Carnations out in the open ground at the Royal Horticultural Gardens, Chiswick, might be made next summer a matter of peculiar interest, assuming that the Council of the Society approved, and Mr. Barron could provide a few rods of ground for the purpose. The great advantage of having trials conducted at Chiswick is that they are open to anyone to see; and there can be hardly a doubt but that a trial of several hundreds of plants would induce very many persons to go to Chiswick to see them. Now I should like to see some clearly defined lines laid down upon which the trial might be conducted, and in the first place particular colours should be asked for, consisting chiefly of selfs. These can be better judged as border flowers than can the ordinary florists' flakes and bizzars; but still classes may be made for flaked and speckled flowers other than florists' varieties. The chief colours found in self flowers are white, yellow, salmon, rose, scarlet, crimson, and purple. There are some colours, perhaps, hard to class, but most of them would be found closely allied to one or other of the colours above named. All parti-coloured flowers might be termed fancies, and be divided into dark and light sections—as thus:—rose, yellow, flesh, or scarlet, markings being placed in the light fancy section, and crimson and purple markings into the dark fancy section. All plants sent should be from layers, no pure seedlings being admitted. Whether named or not, each plant should have the description of the colour of flowers marked on the label, and if also numbered, so much the better. Then, further, some limit should be placed on the number of plants each person should be permitted to send, which should not exceed two in each class, although some may be able to send not more than one, perhaps. The plants should be planted in colours for the purpose of comparison and of giving marks; and if the Council could afford so much, a couple of medals might also be given in each class. The awards should be made by a select body of the Floral Committee, not less than five in number, who should visit the trial weekly until the awards were completed. The plants in due course to be layered, and the senders to have the option of purchasing the respective stocks of his own sending at moderate charges, or leaving them, as he may think fit. Whilst general good quality in the flowers should not be overlooked, the plants generally should be judged as for border decoration. *A. D.*

**LATE STRAWBERRIES.**—I have to-day (October 11) gathered from the open ground a dish of good President Strawberries from plants which fruited early in the season. We have had several frosts, one of which registered 8°, and during the night of the 1st inst., there fell 3 inches of snow. A few Fern leaves were thrown loosely over the plants as shelter, from the cold winds, but not

enough to exclude the light, and no other protection was afforded them. I have also a bed of Haultbos, some of them runners of last year, which bore fruit in summer, and now is full of flower; and many of the runners of the present season have thrown up fine bold trusses of flowers. A fortnight ago I lifted several of the last year's plants, and placed them in boxes in a vinery, the flowers of many of them have set, and are swelling off their fruit. In such a chequered and unusual season we cannot speak fairly as regards the merits or demerits of any of these varieties, either new or old. *D. Davis, Kyne Park Gardens, Tenbury.*

**LONG-LIVED CUCUMBERS.**—In a recent number your correspondent, C. Collins, expressed surprise at a fine house of Cucumbers, which was planted in August, 1887. I suppose him to mean that it is by no means a common occurrence; if so, I quite agree with him, and will give him my experience of growing Cucumbers for two years without renewal. In the year 1872 I was foreman in the gardens at Chilworth Manor, Hampshire, Mr. J. Batters being head gardener. Cucumber and Melon growing was then a hobby with me, and I was allowed free scope to grow them according to my own ideas and ability. I entered the gardens in February and found a Cucumber-house that had been planted the previous February with plants struck from cuttings of Telegraph. The stock had been in Mr. Batters' possession 5 years. The plants had borne good crops all through the previous summer and winter, the vine being gradually renewed by cutting out old shoots and laying in new ones; and now it was determined to see if the plant would continue to bear still longer. To make sure the young stock of plants from cuttings was planted by the side of the old; but the latter by frequent top dressings of old Mushroom-dung and liquid-manure carried a fine crop of Cucumbers the whole of the next summer and following winter, and had not the supports of the bed given way, I think it would have done good service another season. From this it will be seen, that by a careful cutting-out of old branches and laying-in of new, keeping the foliage clean and free from aphids, with oft-repeated manurings, Cucumber plants can be made to produce good fruits for two or more years. The plants may not be quite as vigorous as seedlings, but they are by far more productive. Our plants were always struck from cuttings, the original plants being raised from seed soon after the variety was sent out. Where Cucumbers are required all the year round I should prefer cuttings to seedlings, as I have found them to be the more prolific of the two. The Cucumber-house was about the same size as the one spoken of by Mr. C. Collins, and the border of the same width and depth. Hot-water pipes ran the length under the bed, midway between the floor and the bed, a hole being made in the wall to admit by means of a shutter the escape of too abundant heat into the house, and which we found very useful in raising the temperature of the latter, especially during very cold weather. The plants were kept clean by frequent use of the syringe. The branches were kept thin, so that a good deal of light was admitted—a very necessary point. *F. H. Froud, The Bank, St. Albans.*

**PLANTING SANDHILLS.**—On p. 389 of your last issue "J. E. E." offers suggestions as to the best trees, shrubs, and other subjects to plant on sandhills situated on the north-west coast of England. Living myself on the coast about eight miles from Liverpool to the north, I have experienced the prevailing winds spoken of by "Doubtful," also the shifting sands. I have also been on the east coast from Haverston to Yarmouth, having lived near the first-named place for a considerable time, so that I can speak of both shores. In the first place, I would remind "J. E. E." that to one gale on the east coast we get at least ten on the north-west, and, I may say, these are twice as severe. To secure the sand is by no means an easy matter, and the best things are the grasses recommended by "J. E. E."; but then, again, it is useless to plant them without some kind of protection. The best thing I can recommend "Doubtful" before he begins to plant is to get enough wattled hurdles to extend the whole seaward side of his sandhills, but he must not take in too great a width of sand at one time; 10 yards would be enough, and then he can plant his grasses and intermix them with the common Willow, but if he can get the latter to grow any taller than the grass he will be much more fortunate than I was. I have planted at one time or another nearly all the plants which "J. E. E." recommends, but it has

ended in failure, so I have given it up for a bad job, it being nothing less than waste of time and money to go on with this kind of work. I have got my sandhills well covered with grass, but as for getting further I could not. If "Doubtful" wishes to grow ornamental trees, &c., he will have to build a wall 10 feet high, and then he can try, but I do not know what success he will have even then. We have a wall about half-way between the house and high-water-mark, which is 6 feet high, and topped with 4 feet of good strong trellis, which is crossed, so that only half an inch of daylight is seen between the laths. There is a border inside about 10 or 12 yards wide, planted with ornamental trees in 2 feet of good garden soil; but at the present time these look poor miserable objects, and as for getting them to grow above the trellis, that is out of the question. It is impossible to get a bit of Ivy or any creeper to grow on the west or north side of the house, but on the east things do fairly well—the Ivy especially, which is up to the top of the house. It is a very common occurrence to find chimney-pots, slates, tiles, and squares of glass smashed up in all directions. This year, about the beginning of June, we had a terrific gale; the trees were just out in their first young leaf and looking well, but, alas! the next day after they were like a Scarlet Runner Bean that has had 10° of frost; even the grass on the lawn was as black as your hat, so violent is the wind experienced on the west and north-west coast of the country. If "Doubtful" is situated in the same part anything he may do will be a failure, unless he gets a strong wall built first, and even then I do not think he will find it to pay, let alone be of profit, to cultivate sand, for I know by experience that what I grow costs five or six times its value. *R. G. Townsend, Raulph.*

**THE ONION CROP.**—Not only will there be a very poor crop of Onion seed this year, but we are wondering from whence will come good sound bulbs which will keep long enough to produce seed next year. Only under exceptional circumstances has it been possible to secure well-ripened bulbs, and only such will keep for six months after lifting. The best results have been found where varieties of the Spanish type were sown last autumn, as those mostly stood the winter well, and were fairly well matured sound bulbs. Those bulbs would, however, hardly keep until April next for field planting. In most cases spring-sown Onions have never ceased growing, and natural ripening has been out of the question. Of course, it has been possible to pull the bulbs, and force ripening of a kind, but not solid maturation. The shortness of the crop should make Onion bulbs dear this winter, and therefore there will be greater temptation to sell than to save for seed production. I found white-skinned Onions, such as Tennis-ball, to be so tender that they failed absolutely, whilst bulbs of the type of Danvers' Yellow proved far more hardy, and have seeded fairly well, but of course late. Bulbs of large size, such as Rousham Park Hero, have done badly, the stems decaying because of the excessive moisture. I tried a well-matured Portugal bulb for seed production, and found that it utterly failed to produce seed, although it flowered. We are finding out now that we have a disastrous Onion season, that this feverish anxiety to get large bulbing sorts is a mistake, and that smaller bulbing, harder kinds, are by far more serviceable. As Onion seed next spring may not be too good, it will be as well to sow some in a frame for transplanting, and thus avoid what outdoors may be absolute failure. *A. D.*

**ROOTS AND BUDS OF FRUIT TREES, AND MOISTURE.**—At this season, when trees of all kinds on walls and in the open are ripening their wood of the current year, that which tends to impede the process is dryness at the root, and this evil is very apt to occur during dry months like the present October, when rain has been infrequent over large areas of the country. It is surprising how soon the effects of the heavy rainfalls have vanished from some soils, and roots begin to suffer from the lessened amount of moisture about them, and more particularly is this so where they are not mulched. In such cases it may yet be necessary to water, and though this may by some be considered against ripening, it is of the utmost importance that the foliage be maintained fresh as long as possible, and prevented from flagging. In houses it will be a great help to the trees during bright weather if they are heavily syringed in the afternoon, but the more air they get the better, and lights can be taken off. Should we get a change, and go back to dull cloudy

skies and wet, then a resort to fires must be had, but with warm pipes ventilation should be constant. This applies to Vines as well as other plants, and especially to young canes, which, now that growth is at an end, should have all the lateral shoots removed, leaving nothing but the principal leaves; the buds will then have every assistance to develop and mature. Buds bearing fruit, or from which fruit was cut, should also have all new shoots which may have made removed, as it is important that only the principal foliage should remain; and the best cultivators rarely, if ever, allow Vines to run, or make growth, after the first stopping takes place, unless it is to fill up or extend the spread of the stems. Turning to such trees as Pears, Plums, Cherries, and Apricots on walls, or grown in other ways, all shoots that have been made since the midsummer stopping should be cut out at once, as their removal will not only assist the back buds, but in the case of Pears help much in finishing off any fruit which they may have. *J. S.*

**BEDDING PELARGONIUMS.**—On p. 391 of your issue for October 6, "R. D." speaks in favour of Atkinson over Jacoby. I beg to say that I have bedded out one—viz., *Pride of Trent*—which is superior to any other scarlet I have tried. It is a vigorous grower, throws up a strong flower-stalk, and stands the rain better than any other; in fact, it surpasses when H. Jacoby, Vesuvius, Brighton Gem, and John Gibbons, were nearly without a flower. *Pride of Trent* was presentable; then as a winter flowering variety I have seen no equal to it. The raiser is Mr. Anderson, Clifton Gardens, Notts. Mr. Anderson has used it as a bedder for three years with great satisfaction; I have used it for two, and can speak well of it. The *Pelargonium Henry Jacoby* was raised by Messrs. Pearson, of Chilwell, and is named after Henry Jacoby, the M.P. for Mid Derbyshire. I invariably find it spelt *Henri*. A London gardener argued with me about it, and insisted on using the "i" instead of the "y." *W. M. Geddes, Thrumpton.*

## PLANTS AND THEIR CULTURE.

**GLOXINIAS AND ACHIMENES.**—Any pots full of these plants had better be now transferred to their winter quarters, the tubers being allowed to remain undisturbed. However, if space be limited, they may be turned out and stored in dry sand, in paper bags, being careful to keep the sorts separate, and labelled. Any room where the temperature ranges from 40°–50° would suit very well for the Achimenes, but Gloxinias are safer where the temperature does not fall below 50°. Late flowered batches of these plants, and which have not yet lost their leaves, should not be hurried to rest. A few weeks' attention to watering, and to affording a drier air, will much improve the tubers. The summer-flowering *Nægeliæ*s and *Gesneras* should be treated in a similar way, as also the plants known as *Eucedonias*, but some of these are late flowerers, and may not yet be over.

**Tuberous-rooted Begonias.**—Plants which have been standing out-of-doors, or have been removed from the show-house, should be protected from cold, and placed where they can get abundance of light and air to mature their growth, and which will enable the tubers to make a more vigorous start next season, better than would be the case if the due ripening had been checked. When growth is quite suspended stow them away in some dry place where they will be safe from frost, but where a dry frame is at command, in which to plunge the pots, no better place need be desired, well covering pots, bulbs, and all, with the plunging material. There they will be safe during the winter.

***Cloridendron fragrans flore-pleno.***—The deliciously scented flowers of this plant never fail to please, but as it is often met with, growing in small pots with a single head of flower, the true character of the plant is not observable; but if it be planted out growth is rapid, and the plant soon grows into a large shrub, with numerous corymbs of flowers, which last much longer than those on a small plant; indeed, by taking care to have the bad pips regularly picked off, it gives a succession of flowers for a long period. About the close of the year the shoots should be cut back and the plants put into shape, at the same time giving a good rich top-dressing. This, with an occasional application of liquid manure during the growing season, completes the routine of its management, unless perhaps it be

sometimes advisable to thin out the shoots somewhat at the first break, as from its mode of branching it would get very crowded by the end of one season. *F. Ross, Bletchingley.*

## THE HARDY FRUIT GARDEN.

**FRUIT GATHERING.**—The succession of sharp frosts which we are now experiencing will necessitate the ingathering of all varieties of Apples and Pears still hanging on trees out in the open. But as regards late Pears on walls, as the season has been such a backward one the fruits are as yet rather immature, and if the situation be somewhat sheltered it would be well to allow them to hang another week or ten days, providing, of course, that the state of the weather will allow of this being done. The fruit will then keep all the better, and ripen properly for being allowed to hang a little longer.

Both Apples and Pears should be gathered carefully so as to avoid bruising the fruit, for they cannot be expected to keep well if they are subjected to rough usage. If the fruit-rooms are commodious the fruit should be laid out on the shelves in a single layer only, as they can then be inspected easily, and all decaying fruits be at once detected and removed.

Walnuts are now dropping fast, and when they are required they should at once be knocked off the trees. After separating them from the husks dry and store away in a cool place.

Late varieties of Plums had better be gathered, and if laid out thinly on a shelf in the fruit-room they will keep in a fit state for dessert for some days.

**Strawberries.**—The beds and borders should be looked over once more, and all runners removed. The surface of the soil between the rows should then be lightly loosened with either a hoe or a fork preparatory to their being mulched with half-decayed manure. It is always a good plan to get this done early in the autumn, so as to let the rains work the essence out of the manure down to the roots, and which proves of the greatest possible benefit to them. The manure also helps in a great measure to protect the foliage in bud, and prevents it from being injured by very severe frosts. *A. Ward, Stoke Edith Park.*

## THE KITCHEN GARDEN.

**Box Edgings.**—The present is a good time for mending gaps in and relaying these where necessary. Any repairs that may be required in the walks should first be attended to, keeping the walk slightly higher in the centre than at the sides, and putting in drains if required. Before commencing the Box a few pegs should be inserted along the centre of the walk for the purpose of having fixed points to measure from, and a line stretched parallel with these at the sides where the Box edging will be planted. After digging the ground on the line of edging, tramping and beating it firmly and making level, a trench 4 inches deep with a perpendicular face against the line should be cut; and having broken the Box in pieces 7 to 8 inches long, place it moderately close together along the trench, filling in the soil with the hand, or a trowel, and finally with a spade put back the remainder of the soil and tread firm. No clipping should be done until April.

**Preparing for Winter.**—Every advantage should be taken of fine days to get all weeds and rubbish cleared out of the garden. Brussels Sprouts, Cauliflowers, &c., should have their dead leaves removed. Peas and Beans, &c., that are finished bearing should be cleared off and weeds hoed up and raked off clean. Some beds or rows of Parsley should be protected before hard frost occurs, and a plentiful supply of dry bracken or straw got in readiness for protecting vegetables in the open. Celery should now be earthed up finally in dry weather, leaving but little of the top exposed to the action of frost. *W. H. Divers, Kotton Hall, Stamford.*

**CATTLEYA DOWIANA AUREA.**—A specimen of this very striking variety is now in flower at Gunnersbury Park; it has three remarkably fine blossoms, the sepals and petals sulphur-yellow, the massive lip  $\frac{1}{4}$  inches in length and  $\frac{2}{3}$  inches broad, is grandly reticulated with gold; the margin of the lip crimson-purple with an edge of pale lilac-purple. This is indeed a noble and striking *Cattleya*.

(Continued from p. 443.)

not so here, most of the fine fruit is produced on accidental trees, either found in gardens on taking possession, or planted by incoming tenants. Taking into consideration the time necessary to get a stock of trees into a good bearing state, few tenants would care to adopt any system of planting or training from which they would not derive some immediate advantage.

The cultivation of the Pear has been so very remunerative for years past, that it has been made a subject of more general study and system. Many of the old gardens, established half a century or more ago, offer evidence of the walks having palisades on both sides, for the purpose of training Pear trees upon them, and in some cases, the palisading has been double, so as to admit of trees being trained on both sides, one foot or less being the intervening space between the rows of palisades. Trees planted in this way are generally productive, the main lateral branches being trained and supported horizontally; a regular and continuous supply of sap is provided during the growing season for the development of the fruit. This system has and does answer well, and as long as the trees continue healthy, they bear good crops of fruit, the size of which much depends upon the amount of thinning practised. Against walls, both horizontal, fan, and cordon styles of training are practised, all of which answer well in the hands of careful attendants. Dwarf bush and pyramidal trees are also grown, many acres of ground being devoted to the cultivation of the celebrated Châumontel Pear. The great number of excellent varieties grown, and their exquisite though varied flavour, make the Pear a fruit of general acceptance, though few varieties are much grown. Citron des Carnes, Jargonelle, Williams' Bon Chrétien, Louise Bonne, Maréchal de la Cour, Beurré d'Amanlis, and Diel, Duchesse d'Angoulême, Doyenné du Comice, Châumontel, Glout Morceau, and Easter Beurré are more often met with than other varieties; and amongst culinary pears, the Belle de Jersey (syn. Belle Angevine), and Catillac, or Pound Pear, are considered the best.

A rich, strong loam suits the Quince stock best, a lighter soil suits the free stock for Pears. The advantage of growing Pears on the Quince as a stock is early fructification, whereas, the generally accepted axiom respecting Pears grafted on the free or Pear stock is, that—

"He who plants Pears,  
Plants for his heirs."

There are but few large Pear trees on the island; occasionally one or two are met with, towering above the Apple trees in the orchards, but such trees are the exception, and land is so expensive in Jersey that no room can be spared for unproductive trees (which is the case whilst the tree is growing).

The Jersey farmer, cultivating 20 acres of land, and making a comfortable living off so small a surface, cannot afford to allow a single perch of it to remain unproductive, and every square yard is made to contribute towards the general expenses. The space allotted to kitchen gardening and fruit culture is generally near the homestead, the pathways being planted on either side by bush Apple and Pear trees. Currant and Gooseberry trees filling up the intervening spaces in the rows until the trees have grown sufficiently large to cover the whole space. These highly cultivated and richly manured pieces of ground are made to produce crop after crop in rapid succession. No sooner is one crop off the ground than another replaces it (organic and not artificial manures being used). The trees get the benefit of these repeated dressings and the manipulation of the soil.

## THE CONFERENCE.

This was held at one end of the great vinery, and was well attended. The President took the chair, and was well supported by his colleagues in the Council, most of whom were present on the opening day, together with a large and representative assemblage of gardeners, among whom we noticed many of the leaders of the craft from various parts of England and Scotland. The papers read at subsequent meetings are given elsewhere.

The Conference was opened by an address from Sir Trevor Lawrence, the President of the Society,

who spoke as follows:—It is my duty, and I think it is a most agreeable duty, having the honour of holding the office of President of the Royal Horticultural Society, to make a few—and I promise they shall be very few—introductory remarks in opening the exhibition of this very extensive collection of fruit. I should desire in the first place to disclaim in the strongest possible way any pretension whatever to be entitled to express any opinion on the subject of fruit-cultivation myself. At the same time a very large amount of interest is being at the present moment brought to bear upon the question of fruit-cultivation. I believe in some measure due to the observations that have been made by gentlemen occupying positions in the political world, very often somewhat at a loss for a subject. I think I may venture to remind you that an address of some considerable length was delivered lately at Hawarden by Mr. Gladstone, but I am not quite sure that those persons who read the accounts of the ladies who kept thirty or forty chickens and made £5 per annum out of them, or of the persons who made £40 from 1 acre of Strawberries, will not be disappointed if they expect to repeat so remarkable a success. It is a matter of importance in dealing with this subject that we shall not pitch our anticipations too high, and it should not be supposed that in extending, as reasonably as may be extended, the cultivation of hardy fruit that any real panacea for the troubles which have been afflicting the agricultural classes of this country will be found. The utmost that can be done will be done to give the agricultural classes some help where intelligence and skill are brought to bear. As long as we continue to import such large quantities of fruits and vegetables as we do—between six and seven millions in value annually—that fact will be pointed to as indicating a direction in which more may be done in this country; but it must not be forgotten that the total includes some fruits that cannot be cultivated in this country, and it is a further matter for consideration that it is by no means clear at the present moment that where hardy fruits, such as Pears and Apples can be successfully cultivated, that can be done to bring in anything like a satisfactory profit. Since I have been in the gardens of the Royal Horticultural Society I have asked two authorities what they thought on that subject. One gentleman, who is a most successful cultivator of fruit, told me that with all the care and intelligence which could be brought to bear in the cultivation of Apples and Pears, the profit to be made would not perhaps be more than 6d. a sieve. If it be so it is not a very good profit. The other gentleman said he was quite certain that for all the hardy fruit that could be grown in this country a good market could be found. I trust the latter is the correct view. The present Conference has a different object to those of 1883 and 1885. On the previous occasions an attempt was made to collect every prescription of known Apple, with the view, to a certain extent, of eliminating those varieties that were of little value for purposes of cultivation. And that was also the case with Pears. The present Conference proposes to invite the exhibition of such varieties only as find favour, or may be considered thoroughly worthy of cultivation, and one object of this Conference is to illustrate by facts and examples the present state and future prospects of commercial fruit culture in this country. I venture to think that our object is a thoroughly practical one, and when you pass through this conservatory and the tents which are adjuncts to it you will see that, having regard to the exceedingly unfortunate season which we have passed, the exhibition made by the leading fruit growers of the country is one which is eminently satisfactory. It appears to me that what the Conference can most wisely do, and that which the papers to be read promise to do, is to draw attention to the varieties which can best be cultivated, both of Apples and Pears, throughout the country, having regard to the various conditions of climate and soil. Having read the programme for the week, which we have already published, and remarked that the Chairmen for the three last days of the Conference were all excellent men, who would bring additional light to bear on the subjects of discussion, the Chairman went on to say:—One matter of importance has been dealt with by the House of Commons, and that is the question of railway charges for carriage. As Mr. Gladstone justly pointed out in justification of the preferential rates that they have been charging, it was owing to the fact that in dealing with the foreign producer they dealt with a trainful of baskets or hampers, whereas when they came to deal with the local producer they had to

collect the fruit, which puts them to considerable expense. At the same time I think the Legislature has acted perfectly right in deciding that these preferential rates shall be considered and revised by the Board of Trade, for, as we all of us are sometimes painfully aware, the railway companies have had given to them a monopoly of the means of transport of this country. I have observed in the newspapers that as a result of one of the conferences that have lately taken place, some attacks on the gentlemen who devote themselves to the calling of nurserymen. We are told that nurserymen keep large quantities of worthless varieties of Apples and Pears. I have no doubt that that is the case, but what I should think would be ground for blaming them would be if they represented those worthless varieties as good varieties. I have not the least doubt that there is no gentleman connected with the trade who, if I were to get him to recommend me the very best variety for my soil, but who would honestly and judiciously recommend the best varieties. There are persons who desire to make experiments for themselves, and they will not be satisfied that such and such varieties are worthless unless they have tried them themselves. I cultivate a good many Orchids, some of which are considered by my friends to be worthless varieties. At the same time I always cultivate them, and when I go to other gentlemen to purchase them I should not like to be told that they were worthless. It is really a matter of trade, and I think the attacks which have been made are ungenerous and uncalled for. I am quite certain that with regard to the cultivation of hardy fruit exactly the same conditions are necessary for success as with every other description of gardening, that is to say, you must display skill, care, and intelligence, and I think you will find that has a good deal more to do with the result than climate. I remember at the Conferences which took place in 1883 and 1885 a good many of the best exhibits came from the North of Scotland, where the climate is represented to us who live in the South as somewhat severe. However that may be we have got to make the best we can of our climate and taking one year with another I think on the whole it is a very good climate, and if we do not succeed we shall be wiser if we place the fault on our own shoulders than on the shoulders of the climate. I do not think I can add anything else, except to say that the Royal Horticultural Society is extremely indebted to the very large number of persons who have contributed to this show. It is a most satisfactory and numerous one, and one which is most creditable to the exhibitors. The Society have been most anxious to do all it could to promote the undertaking, and they hope to do something to lead the public in wisely making use of the feeling which exists at present in favour of the cultivation of hardy fruits. I trust the Conference will bear good fruit both practically and figuratively.

Mr. SHIRLEY HIBBERD moved a hearty vote of thanks to the Council for inaugurating the exhibition. It had been attended with considerable difficulty, but up to the present everything seemed to have passed off smoothly, and he congratulated them on the success attained. While they had been organising the exhibition other persons had been busy in the same kind of work, and those persons appeared to him sometimes to be freer in their mode of operation. This Society appeared to be more fettered,—it might be to their advantage,—but he had no confidence in any of the associations which had been started lately, and he thought the Royal Horticultural Society rendered them unnecessary. Political, economical, and commercial questions were involved in the question of fruit culture but this Society was content for the present to determine the merits of varieties. This Society should be the last to convert itself into a political agency. They did not want that; but he thought their Fruit Committee should have their powers extended to deal with such things as market tolls, the conveyance by railway, and other difficulties which stood in the way of the seller.

Mr. CHERRIL seconded the motion, and expressed his gratification that the Council had stepped forward at this moment to place before the country in a practical form what ought to be done, and the best way of doing it.

The CHAIRMAN, on behalf of the Council, returned thanks for the vote, and added that the Council were most anxious to give all assistance to growers in all branches of horticulture. As to whether the questions referred to were within the province of the Society

it was a matter about which opinions might differ. He was one of those persons who believed that the more the cobbler kept to his last the better he was likely to do his work. The questions were important to the subject of fruit growing but they wanted to give every assistance to persons who devoted themselves to the cultivation of hardy fruit—that was clearly within their province. One great advantage of the Conference was that it showed that the collections were more accurately named than was the case in either 1883 or 1885, which proved that the people understood their business a good deal better now than then.

#### THE EXHIBITION.

OCTOBER 16, 17, 18, 19 AND 20.—This meeting is now an accomplished fact, the fruits were numerous beyond all expectation, and of a quality and size which the ungenial season of 1888 scarcely gave promise of. In forming an estimate of these two points, the mind naturally reverts to the Conferences of 1883 and 1885, which were held in years when the weather during the period of growth and ripening had been almost all that could be desired by the cultivator; and this method of comparison allows us to perceive that the fruit of this year lacks colour—always a desideratum—and the size is not quite up to that commonly observed in the years named.

Some abnormally fine specimens of both culinary and dessert Apples and Pears were to be observed in collections from Home, Southern, and Western Counties, whilst in Northern, and in some Midland, fruits of large size, seldom very observable in fruit from these parts of England, was rendered still more marked, owing to the cold character of the past summer.

Although in point of numbers and general excellence, the trade collections head the list, it is not to these we ought to look for fine specimens; for out of the numerous young trees in nursery quarters, it is always possible to select fine specimens for the show-table. But when the private grower, with his comparatively few trees can put up, say twenty-four dishes of Pears, and the same number of Apples of good quality we may be pretty sure that the varieties shown are such as are suited to the soil and climate of the particular locality—good cultivation being equal in all cases. The method of training the tree does much to influence size and colour; hence we found that the best specimens were the produce of cordons, espaliers, and pyramids—these modes of training admitting the maximum of sunlight to reach the fruits; the thinning of the latter can be likewise easily carried out. And, as a rule, the converse holds good, the produce of aged and large-headed standards being mostly under-sized, and of good colour only when found at the extremities of the branches.

Some of the finest fruits observed at the show were, we understood, to be from miniature trees grown in pots and assisted with surface dressings of artificial and other manures.

In our lists of varieties from various parts of the country many of those now popular will be found amongst them, and these of large size and general excellence, but whether these varieties crop equally well in all parts the exhibitors themselves afforded no information. Local varieties were not many, and were chiefly noticeable in those exhibits from Western Counties. The Home Counties, which have never made a speciality of fruit growing—at least, of Apples—seem to have but few local varieties of Apples, and none of Pears, and these few of the former are getting rapidly supplanted by improved varieties. Beyond the Trent, local varieties find place in most gardens, some inherent good property, it may be, of prolific cropping, late flowering, the readiness with which the wood ripens in the cool summer of the North, or the smaller size of the fruits, which prevents them being blown down by boisterous winds, causing them to be generally planted.

HOME COUNTIES.—Fifty varieties most worthy of cultivation.—In this class Mr. C. Turner, Royal Nurseries, Slough, exhibited Blenheim Orange, Lord Derby, Annie Elizabeth, Hollandbury Pippin, Nelson's Glory, Lord Sheffield, Broadeye Pippin, Golden Noble, Mère de Ménage, Norfolk Beauffin, Kenswick and Manks' Codlins, Ribston, Peasgood's Nonsuch, Golden Spire, Lane's Prince Albert, Ecklinville, Cellini, Grenadier, Bannmann's Reineette, Scarlet Nonpareil, Cox's Orange very poor, Wellington, Stirling Castle, Frogmore Prolific, Emperor Alexander, &c. The tickets were marked to indicate on which kind of stock—Crab or Paradise

—the fruit had grown. The size was fair only, and in clearness of skin and colour the samples were good.

Messrs. G. Bunyard & Co., Old Nurseries, Maidstone, showed splendid fruits of Emperor Alexander, from a tree grown under glass—that were scarcely approached by any others of the variety shown, Pott's Seedling, Cox's Pomona, Lady Henniker, New Hawthornden, the Queen, a recent variety, Grenadier, Golden Noble, and Lord Grosvenor were remarkable for size and generally good points. We may likewise specify Beauty of Kent, Queen Caroline, Belle Pointoise, Calville Malinore, Hornmead's Pippin, and Blenheim Orange.

Messrs. C. Lee & Son, The Nurseries, Hammersmith, exhibited a very superior, well coloured collection in this division, the majority being culinary varieties. Some of the finest, and evidently at home on the medium soil of Isleworth were—Alexander, Lord Derby, Mère de Ménage, Golden Noble, Manks Codlin, Alfriston, Blenheim Orange, Beauty of Kent, Lane's Prince Albert, Wellington, Hambleton deux Ans, Lord Suffield, Yorkshire Beauty, a variety always shown in good size and of high colour; Barchard's Seedling, Hollandbury, Stirling Castle, Small's Admirable, Ecklinville, Peasegood's Nonsuch, Warner's King, Cellini, &c. Of dessert varieties there were:—Fearn's Pippin, high in colour, if not quite up to the usual size; Winter Pearmain, Rosemary Russet, Court Pendu-plat, small; Sturmer, Margil, Dutch Mignonette, Scarlet Pearmain, Cox's Orange, Cox's Pomona, Kerry, Yellow Ingestre, Golden Reinette. This was a collection, one of the best, from the home counties.

Messrs. Paul & Son, Old Nurseries, Cheshunt, Herts, had also a fine collection: very fine were Cockle Pippin, King of Pippins, Round Winter Nonsuch, Grenadier, Cheshunt Pippin, and excellent examples were noted of Court of Wick, Ribston, Fearn's Pippin, Blenheim Orange, Royal Russet, Cox's Orange, Cox's Pomona, Bedfordshire Foundling, American Mother, Hawthornden, Paul's New Winter Hawthornden, and good earlies.

W. Roupell, Esq., Harvey Lodge, Streatham, exhibited a clean large well-grown collection from rather unpromising soil, but which by thorough working and incorporating soot, lime, sand, manure, and above all surface mulching the trees, he has been enabled to grow very good apples. Of newer varieties may be mentioned Cox's Pomona, Grenadier, Bismarck, Domino, Sandringham, the Queen, Baumann's Winter Russet. Older ones were Sturmer, Blenheim Orange, King of Pippins, Warner's King, Stone's Pott's Seedling, Peasegood's Nonsuch, Bedfordshire Foundling, Duchess's Favourite, Egremont Russet, &c. Messrs. T. Rivers & Son, Sawbridge-worth, showed a collection of uniformly finely grown fruits, well coloured, clean and large, some of which had doubtless been grown under advantageous conditions under glass. The collection was a good representative one, containing the most popular varieties. The selected fruits are:—Ribston, King of Tompkins's County, Cox's Orange, Emperor Alexander, Melon, Lady Henniker, Gloria Mundi, Buckingham, Betty Geeson, Mère de Ménage, Washington, Ecklinville, Cox's Pomona, Cox's Orange, Schoolmaster, Cellini, King of Pippins, Old Hawthornden, Scarlet Pippin, and Tower of Glamis.

The collection shown by the Society in the class was also a very good representative collection, in which the most noticeable were Baumann's Red Reinette, Cox's Pomona, Lane's Prince Albert, the Queen, Frogmore Prolific, Cellini, Stone Apple, Gascoigne's Seedling, Cox's Orange Pippin, Golden Noble, Ribston, Yellow Ingestre, Gravenstein, Ecklinville Seedling, and Swedish Reinette.

The collection shown by Messrs. J. Veitch & Sons, Chelsea, taken as a whole was one of the best exhibited, the fruit being large and brightly coloured, the best were Cellini, Warner's King, the Queen, Lord Suffield, Bismarck, Grenadier, Sandringham, Dumelow's, Stone's, Bramley's Seedlings; Frogmore Prolific, Blenheim Orange, Adams Pearmain Peasegood's Nonsuch, Norfolk, Beaufin, Annie Elizabeth, Cox's Pomona, Baumann's Red Reinette, Melon, Lady Henniker, Prince Albert, Braddick's Nonpareil, and Herefordshire Beauty.

Messrs. H. Lane & Son, Great Berkhamstead, exhibited good fruits of the more generally popular newer varieties, and some of the less known ones, viz., Baumann's Red Reinette, Prince Albert, Mrs. Barron, Schoolmaster.

Messrs. W. Paul & Sons, Waltham Cross, in this class showed good samples clear in the skin and fairly well coloured, of Cox's Pomona, Mabbott's

Pearmain, Golden Spire, Palmerston Russet, Hoary Morning, White Calville, Golden Pearmain, Stirling Castle, and Northern Spy.

Mr. T. Bunyard, Nurseries, Ashford, Kent, showed fruit, some of which was much over average in size, but in some cases not in character. Excellent were Waltham Abbey Seedling, Small's Admirable, Alexander, Maux Codlin, Gloria Mundi, Golden Noble, Hanwell Souring, Harvey's Wiltshire Defiance, a large but light apple Cox's Orange, Belle Joseph, Court of Wick, Prince Albert, American Mother, Schoolmaster, King of the Pippins, Hughes' Golden Pippin, a large crimson and green coloured fruit.

Mr. J. H. Rose, gr., Locking Park, Wantage, Berks, sent many small fruits, below average in size and appearance. Cornish Aromatic, Duchess of Oldenburg, Worcester Pearmain, Ribston Pippin, Red Quarrendon, American Mother, Fearn's Pippin, Betty Geeson, Reinette du Canada, Cox's Orange, Cornish Gilliflower, Court Pendu-plat, Golden Russet, Ribston Pearmain, Royal Russet. The collection represents the best of our Apples fit to be grown in most parts of the country.

*Twenty-four varieties of Apples best adapted to exhibitor's district.*—Messrs. W. Paul & Son, Waltham Cross, showed clean skinned, medium sized fruits of Tower of Glamis, Blenheim Orange, Stirling Castle, Worcester Pearmain, Ribston Pippin, Waltham Cross Seedling, Ecklinville, Reinette du Canada, Keswick, Fearn's Cox's Pomona, Annie Elizabeth, Warner's King, Golden Spire, King of the Pippins, and Rostocker.

Fruits of fine quality generally were shown by Messrs. Saltmarsh & Son, Chelmsford; the following varieties were the best:—Alexander Cellini, Summer Orange, probably a local variety, an angular fruit of a bronzy red colour; Royal Russet, Garrett Pippin, Prince Albert, Lord Suffield, King of the Pippins, Warner's King, the Queen, Worcester's Favourite, Cox's Pearmain, Winter Hawthornden, Ribston Pippin, Cox's Orange.

Messrs. John Peed & Sons, Roupell Park Nursery, Streatham, Surrey, exhibited large specimens of popular kitchen and dessert varieties. The soil is heavy and the situation of the nursery high. Cox's Orange, Beauty of Kent, Worcester Pearmain, New Hawthornden, Peasegood's Nonsuch, Prince Albert, Warner's King, Alexander, Cellini, Washington, The Queen being shown.

Mr. C. Hoare, gr. to Sir R. Sutton, Bart., Benham Park, Newbury, Berks, showed fair fruits, but their general appearance points to unsuitable stocks or soil.

Mr. R. Smith, gr. to Lady Frances Fletcher, Kenward, Yalding, Kent, showed well coloured fruits, some of very fine quality, judging from appearance: Beauty of Kent, Winter Queenening, Reinette du Canada, Alexander, Warner's King, Tom Pott, Blenheim Orange, Grand Duke Constantine, a showy fruit; Wellington, King of the Pippins, &c.

Mr. A. Waterman, gr. to H. A. Bracey, Esq., Preston Hall, Aylesford, Kent, had a very nice collection of large well coloured fruits, skin clear and smooth. Good were Gravenstein, Queen Caroline, Lady Henniker, Alexander, Stone's Seedling, Cox's Orange, Ribston, Prince Albert, Peasegood's Nonsuch, Gloria Mundi, Worcester Pearmain, Tower of Glamis, Lord Derby, &c.

Messrs. J. Peed & Sons, Streatham, the same district, therefore, as Mr. Roupell's, showed fine examples of Lord Suffield, Henri Decaume, Fall Pippin, Schoolmaster, Keswick Codlin, Warner's King, and Winter Hawthornden.

Messrs. G. Bunyard & Co. exhibited fruits, all of which showed high colour and good development. The finest were Cox's Orange, Tower of Glamis, Lord Grosvenor, Pott's Seedling, Cellini, The Queen, King of the Pippins, Lord Suffield, Small's Admirable, Grenadier, Cox's Pomona, Worcester Pearmain, Golden Noble.

A. H. Smece, Esq., The Grange, Wallington, Surrey (gr., Mr. Cummins), had fruit of generally high colour, with clear skin. This was a private grower's lot of Apples, and contained fruit more remarkable for their flavour and quality rather than for size. Of dessert varieties there were Court of Wick, King of the Pippins, Duke of Devonshire, Brownlee's Russet, Blenheim Orange; and in culinary Apples, New Hawthornden, Cox's Pomona, Queen Caroline, Striped Beaufin, Cellini, Nelson's Codlin, Wellington, Waltham Abbey Seedling, and Beauty of Kent. These fruits were grown on land that is intersected in all directions by watercourses, and where the average water level cannot be more than 3 feet below the surface.

In this class Messrs. Lane & Son, Great Berk-

hamstead, showed fine examples of the following:—Schoolmaster, Blenheim Orange, Stirling Castle, Flower of Kent, Fearn's, Stone's Pippin, Emperor Alexander, King of the Pippins, Prince Albert, The Queen, Ecklinville, Peasegood's Nonsuch, Cellini, and one of the Apples of the future, Baumann's Red Russet. These fruits may be considered as being very suitable to plant on soil that is stony, not naturally of rich quality, but which admits of improvement by cultivation.

Mr. Roberts, gr. to Messrs. Rothschild, Gunnersbury Park, Acton, showed Apples of large size, high colour, and smooth healthy appearance, evidently well suited to the soil—loam on clay—of that district. We mention Alfriston, Lord Derby, Hawthornden, Mère de Ménage, Cox's Orange, Wortley's Favourite, Peasegood's Nonsuch, Alexander, Ribston, Cockle Pippin, Cox's Pomona, Claygate Pearmain, Adams' Pearmain, Warner's King, and Rosemary Russet.

Messrs. J. Veitch & Son, Chelsea, exhibited fine, large, high-coloured well-finished fruits from the nursery at Langley, and from that at Fulham. The following were some of the best samples:—Cellini, Mannington's Pearmain, Winter Hawthornden, Kerry Pippin, Ribston, Cox's Orange, Worcester Pearmain, Brownlee's Russet, Baumann's Red Russet, Warner's King, Alexander, Pott's Seedling, Scarlet Pearmain, Reinette du Canada, and American Mother.

From the gardens of the Marquis of Abergavenny, Eridge Castle, Tunbridge Wells, gr. Mr. Rust, some very fine fruit was exhibited in this class, and other collections. Roundway, Magnum Bonum, Betty Geeson, Hall-door, Wadham Pippin, Crimson Queenening, White Paradise, Hanwell Souring, Emperor Alexander, Lady Henniker, Ribston Pippin, Cox's Pomona, Mère de Ménage, and Queen Caroline, were the best amongst the remainder.

Messrs. J. Laing & Sons, Stanstead Park Nurseries, Forest Hill, S.E., on medium soil overlying gravel, sent a collection of Apples, particularly good in quality for the soil there and the unfavourable season; Blenheim Orange, Lord Suffield, Emperor Alexander, Stirling Castle, Cox's Pomona, Gloria Mundi, Cellini, King of the Pippins, Lord Derby, Atkin's No. 2, Ecklinville, Worcester, Pearmain, Prince Albert, Warner's King, Ribston Pippin, and Manks Codlin.

The Society's collection contained the following as suitable for culture round Chiswick:—Duchess of Oldenburg, Frogmore Prolific, New Hawthornden, Blenheim Orange, Ecklinville, King Harry, Small's Admirable, Cox's Orange, Beauty of Kent, Warner's King, Golden Spire, Lord Grosvenor, Baumann's Winter Reinette, among others. These were generally clean, but deficient in colouring.

*Twelve varieties of Apples best adapted to the exhibitor's district.*—Mr. J. Hudson, gr., Gunnersbury House, Acton, showed very nice fruits of Blenheim Orange, Golden Knob, Lord Derby, Wellington, Cornish Aromatic, Scarlet Nonpareil, Hollandbury, and Duck's-bill.

Messrs. Paul & Son, the Old Nurseries, Cheshunt, exhibited specimens of kitchen varieties, viz., Alexander, Stone's Seedling, Mère de Ménage, Alfriston, Grenadier, Cox's Pomona, Tibbett's Incomparable, Stirling Castle, Blenheim Orange, and Lord Suffield.

Messrs. J. Veitch & Sons, Chelsea, exhibited fine examples of Warner's King, Lord Suffield, Ecklinville, Sandringham, Baumann's Red Reinette, Northern Greening, Rosemary Russet, and King of the Pippins.

*SOUTHERN COUNTIES.—Fifty varieties.*—Messrs. J. Cheal & Sons, Crawley, showed fruits of high colour, large and thrifty looking. Most of the favourite varieties grow well in the soil of Sussex, so that it is needless to specify any but those which were remarkable for size or novelty: such were Northern Dumping, Cellini, Mère de Ménage, Peasegood's Nonsuch, Domino, Blenheim Orange, Dutch Mignonette, Egremont Russet, Lord Lennox, and the Professor.

Messrs. Lacombe Pince & Co., Nurseries, Exeter, exhibited large fruit of good colour. We specify Royal Russet, Tom Pott, Devon Quarrendon, Cox's Pomona, Tibbett's Pearmain, Ribston, Lord Panlet's Pearmain, Bellefleur, Lord Suffield, Dutch Mignonette, Ecklinville and Warner's King.

Mr. W. G. Pragnall, gr., Sherborne Castle, Dorset, had a collection of medium sized fruits, not so clear in the skin as some others shown, and not in character in some cases, Lady Henniker, Alfriston, King of Pippins, Doux Argent, Gloria Mundi, Blenheim Orange, Rosemary Russet, Reinette du Canada, Lemon Pippin, Royal Somerset, Alexander, Nonsuch

Catshead, Adams' Pearmain, and Sturmer were the finest.

Messrs. R. Veitch & Sons, Nurseries, Exeter, had a collection made up chiefly of fine-looking fruits of over the average size. It will suffice to say that these were the choicest varieties in dessert and culinary Apples, and it was remarked that local Apples, of which Devon has so many, found no place amongst them.

Mr. C. G. Selater, Nurseries, Heavitree Bridge, Devon, showed fruits of high colour and large size, the varieties being those tabled by nurserymen generally, the uncommon fruits being Glory of the West, Beauty of Hants, Autumn Gilliflower, American Grindling, Napoleon, Dutch Codlin, and Red-ribbed Greening, mostly of showy character.

*Twenty-four varieties best adapted for the district.*—Very fine were Blenheim Orange, Alexander, Dumelow's, Peasgood's Nonsuch, Alfriston, Gloria Mundi, New Hawthornden, Mère de Ménage, and Ribston, shown by W. E. Brymer, Esq., Ilington House, Dorchester.

Messrs. J. Cheal & Sons, Crawley, Sussex, had a fine lot of high-coloured, large fruits, The Queen, Duchess of Oldenburg, New Hawthornden, Prince Albert, Warner's King, The Professor, Cox's Pomona, and Yorkshire Beauty being some of the most striking.

Mr. W. Gallop, Bradford Peverell, Dorset, showed dishes of small fruits, the large ones being few, and consisted of Nelson's Glory, Alexander, and Winter Peach.

*WESTERN COUNTIES.*—*Fifty varieties.*—Mr. G. Griffin, gr., Sleaford Park, Haverfordwest, exhibited many fruits of fine size and colour—such were Kentish Filbasket, Wheeler's Russet, King of Pippins, Cox's Pomona, Adams' Pearmain, Winter Hawthornden, Alexander, Warner's King. Mr. J. Watkins, Pomona Farm, Withington, Hereford, exhibited varieties found generally in other first-class collections, and these were well grown, and with the good colour and clear skins found commonly on Herefordshire Apples. Belle Bonne, Tyler's Kernel, Crimson Cordard, Scarlet Crofton, were varieties not often found in other lots. Messrs. R. Smith & Co., Nurseries, Worcester, showed fruits, generally of a large size and high colour, but not always exhibiting the fruit at its best. The varieties are such as are found in all of the good collections shown by the trade; Calville Rouge, Alexander, New Northern Greening, Worcester Filbasket, and Golden Winter Pearmain.

*Twenty-four varieties best adapted to exhibitor's district.*—Mr. T. Coomber, gr. to A. J. Rolls, Esq., The Hendre, Monmouth, showed a collection, which contained good fruits of Alfriston, Ecklinville, Alexander, Blenheim Orange, Lord Suffield, and Tibbett's Pearmain.

Messrs. J. Jeffries & Son, Nurseries, Cirencester, showed clean well-grown fruits, many of them over the average of size. We may name Potts' Seedling, Kerry Pippin, Alexander, Small's Admirable, Grenadier, Gloria Mundi, Cox's Pomona, Worcester Pearmain, and Tower of Gold, to the Earl of Ducie, Tortworth, Gloucestershire, had a collection of large and small fruits, some apparently not liking the soil of the district, or had suffered much from the weather. The best were Winter Strawberry, Mère de Ménage, Waltham Abbey Seedling, Brabant Bellefleur, Nelson's Glory, Hawick, and Warner's King.

*MIDLAND COUNTIES.*—*Fifty varieties.*—Messrs. Dicksons (Limited), nurseries, Chester, had by far the best lot from the Midlands, but the color as in all fruit in the Midlands and north is deficient. The varieties were in the main the same as all the Nurserymen exhibited with a sprinkling of those more locally known, viz., Wareham Russett, Jolly Beggar, and Bellringer.

*Twenty-four varieties suited for the district.*—Mr. Gleeson, gr. to the Duke of Newcastle, Clumber Park, Notts, had a collection of rather small fruits, many being without names; fine were Dutch Mignonette, Lord Suffield and King of Pippins.

Mr. W. H. Frettingham, nurseries, Beeston, Notts, showed ordinary varieties, and has a good and suitable soil, where, with some attention, Apples would grow well, Nonsuch, Blenheim Orange, King of the Pippins, Beauty of Hants, Frogmore Prolific, Lord Suffield and Spencer's favourite were the best.

Mr. A. Christie, gr. to the Earl of Warwick, Warwick Castle, had smallish examples of large culinary varieties; Warner's King, Lord Suffield, Beauty of Kent, Lord Grosvenor, and Cox's Pomona, were the best of them.

Mr. J. Grey, gr., Normanton Park, Stamford, showed New Hawthornden, Annie Elizabeth, War-

ner's King, Gravenstein, Smalls' Admirable, Peasgood's Nonsuch, and Worcester Pearmain, as his best fruits.

Mr. W. H. Divers, gr., Ketton Hall, Stamford, showed in this class, but the fruits were generally very small: Duke of Gloucester, Carlton Seedling, and Golden Noble, were the best.

Mr. R. Milner, gr., Sundorne Castle, Shrewsbury, showed excellent fruits, from cordons and pyramids, of Stirling Castle, Gloria Mundi, Warner's King, Dumelow's Seedling, Cellini, Ribston Pippin, and Cox's Orange.

*NORTHERN COUNTIES.*—Mr. W. Chuck, gr. to P. Thelluson, Esq., Brodsworth Hall, Doncaster, showed fruits which indicated the adverse character of the weather during the past season in that part of the country. The presentable fruits were Blenheim Orange, King of the Pippins, and Cellini.

*Desert Apples.*—There were several exhibits of a collection of twelve dishes of desert Apples, and the specimens were generally of a high order of merit, Mr. W. Crump, gr. to Earl Beauchamp, Madresfield Court, Malvern, showing twelve dishes remarkable for their very high colouring; in size they were average. Cox's Orange Pippin, King of the Pippins, Strawberry Pippin, Blenheim Orange, May Queen, Fearn's Pippin, Court pendu-plat, Brownlee's Russet, being the chief examples; some of the finest desert Apples shown.

Mr. C. Turner, Slough, sent a collection of clean sound fruits, of average size, and of handsome appearance; he showed capital examples of Adams' Pearmain, Cox's Orange Pippin, Scarlet Pearmain, Ribston Pippin, King of the Pippins, and Cluster Golden Pippin.

Messrs. Saltmarsh & Sons, Chelmsford, had good fruits of Ribston, Duchess of Oldenburg, Garrett Pippin, and Summer Orange, with large fruits of Cox's Orange.

The collection from Messrs. J. Veitch & Sons, Chelsea, S.W., was composed of very clean and plump fruits, of which Manning's Pearmain, Cox's Orange, King of the Pippins, Devonshire Quarrendon, Margil, Ribston, Kerry Pippin, and American Mother were good examples.

—Brymer, Esq., had examples of average quality, in which Claygate Pearmain, King of the Earlies, and Cornish Aromatic were shown.

A collection of very pretty and clean fruits were shown from the gardens of H. A. Brasse, Esq., Aylesford, Kent (gr. Mr. A. Waterman); Worcester Pearmain, Blenheim Orange, Ribston, Cellini, Cox's Orange, and Cox's Pomona were the chief examples.

Mr. J. Rust, Eridge Castle Gardens, Sussex, with Winter Queening, Sturmer Pippin, Duke of Devonshire, Norfolk Bearer, and Rosemary Russet; and Messrs. J. Peed & Sons, Streatham, completed the display in this section. From these varieties there may be seen very well what varieties are most worthy of cultivation in this country.

The collections of six dishes were not of such a good general character as in the larger class of twelve, but there were several good exhibits. The varieties differed but little from those in the foregoing classes. Mr. Frettingham, for example, had Eve in his collection, and Mr. J. Hudson, gr. to H. J. Atkinson, Esq., M.P., Gunnersbury House, Acton sent good fruits of Gravenstein, Court of Wick, and Blenheim Orange, &c.

Several richly-coloured and very fine specimens were in the collection of Messrs. Paul & Sons, Cheshunt, N.—Wyken, Cox's Orange (very fine), Kerry Pippin, and Worcester Pearmain being worthy of note.

Messrs. G. Bunyard & Co., Maidstone, Kent, sent Melon Apple, Margil and Kerry Pippin, in good form. Scarlet Nonpareil and Cackle Pippin were fine fruits in Messrs. J. Veitch & Sons' dishes of well-coloured and fine fruits. Messrs. C. Warden and J. Roberts also sent collections, and Mr. C. P. Saunders, Jersey, had specially fine and good-coloured samples of popular varieties.

*Culinary Apples.*—In the corresponding large class for culinary Apples (twelve dishes), there was also a good display, but a greater range of quality. H. A. Brasse, Esq., contributed dishes of very fine quality, large and clean: Blenheim Orange, Peasgood's Nonsuch, Stirling Castle, Warner's King, Gloria Mundi, Washington, and Lane's Prince Albert were all good fruits, but not of very high colouring. Mr. Crump sent a grand lot of dishes; Peasgood's Nonsuch (handsome and highly coloured), Cellini (good colour), Stirling Castle, Warner's King, Lord Derby, Lord Suffield, and Lane's Prince Albert, were the chief varieties. Mr. J. Roberts, gr. to Messrs. Rothschild, Gunnersbury Park, Acton, W., sent good

specimens of Peasgood's Nonsuch, Cox's Pomona, Alexander (finely coloured), Beauty of Kent, Ecklinville, and Warner's King. In the collection from Mr. W. H. Frettingham, The Nurseries, Beeston, Notts, Peasgood's Nonsuch, Spencer's Favourite, Duchess of Oldenburg, Lord Suffield, and Warner's King were very good.

Mr. C. Turner had as his best fruits Old Hawthornden, Frogmore Prolific, Mère de Ménage, Keswick Codlin, Stirling Castle, and Blenheim Orange, all the dishes, however, being clean and healthy fruits. The collection from the Society's own collection was composed of good fruits of useful varieties, but deficient in colouring. Stirling Castle, Golden Knob, Stone Apple, Blenheim Orange, Warner's King, Lane's Prince Albert, and such like varieties were shown.

There were not many exhibitors of the smaller collections of culinary Apples, Messrs. J. Veitch & Sons and Messrs. J. Cheal & Sons, Crawley, Sussex, contributing some of the best, all well-known varieties; Messrs. Frettingham and Middleton also contributed.

*Fruits from trained trees, &c.*—In the classes for a collection of fruit from cordon, bush, or pyramids, and from standards in orchards, there was not observable the difference in quality which might have been expected, but those grown on the bushes, &c., were, if anything, smoother than the others. Messrs. J. Cheal & Sons; W. and E. Wells, Hounslow; J. Grey, Normanton Park, Stamford; and J. Watkins, Pomona Farm, Withington, Hereford, contributing good examples in the bush, &c., class; and of fruit from the standards in orchards Messrs. Wells, J. Watkins, R. Dean, R. Pennington, H. Merryweather were exhibitors, the last-named showing his varieties as Bramley's Seedling, Domino, and Clarke's Seedling, in good and large specimens.

The class for Apples grown on special stocks unfortunately did not bring out exhibits, and thus an opportunity for comparing the effects of various stocks was lost. Messrs. H. Veitch & Sons, of Exeter, who did enter, sent fruits which were all from the English Paradise, and by themselves were valueless.

*Market Apples.*—The specimens of Apples as grown for market were an attractive feature of the show. They were all excellent samples, but it is necessary to see the large baskets of the varieties in order freely to appreciate their effects. A remarkably handsome lot were those from Messrs. G. Bunyard & Co., large and finely coloured, and in good condition.—The Queen, Cellini, Ecklinville, Warner's King, Beauty of Kent, Grenadier, Worcester Pearmain, Duchess of Oldenburg, Cox's Orange, Stirling Castle, and Pott's Seedling. Messrs. Paul & Son had capital example of King of the Pippins, Golden Knob, Blenheim Orange, Stirling Castle, Fearn's Pippin, Counsellor, Wellington, and Claygate Pearmain being the varieties shown here, and all good. Messrs. W. and E. Wells also sent a good collection of smaller size.

*Miscellaneous.*—The miscellaneous exhibits were not very numerous. W. T. T. Dyer, Esq., C.M.G., Kew, Surrey, sent a few dishes of fruits. From Messrs. Dicksons, Chester, there came a collection of Apples, but all the fruits were of small size. Wadhurst Pippin, London Apple, Hambleton Deux Ans, Rymer, and Flower of Kent, &c., were to be seen here.

The Rev. W. Wilks, Shirley Vicarage, Croydon, had a dish of Cox's Orange of wonderful size, being three or four times larger than usual, of a bright yellow colour, and altogether extremely fine and handsome, having been grown under glass. W. T. Manning, Esq., Blackheath, had a few dishes; and a dish of very large and excellent fruits of Domino were shown by H. Miller, Esq., Chiswick. A dish of New Northern Greening was shown by Messrs. J. R. Pearson & Sons, Chilwell, Notts; the variety is stated to keep well till June.

*SCOTLAND.*—Apples from Scotland were fairly numerous, but with the one exception of those sent by Mr. McDonald, Perth, were inferior to the collections from English counties which, considering the bad season, is not at all to be wondered at. Mr. McDonald had some very fine, clean and large fruits of Peasgood's Nonsuch, Cox's Orange, Wellington, Tower of Glamis, Blenheim Orange, and Ecklinville in his collection, only lacking colour to make them first-rate examples.

Mr. M. Dunn, Dalkeith, contributed an extensive collection, but the specimens had unfortunately been damaged in transit; they were, however, fairly good, and mostly of medium size. Some of the best shown were Worcester Pearmain, Lord Nelson, Orange Pippin, Gravenstein, Carraway Reinette, Loddington,

Scarlet Pomona, Alfriston, Golden Knob, Ecklinville, Bedfordshire Foundling, Cox's Pomona and Warner's King.

A fairly large collection was from Messrs. Dickson & Co., 1, Waterloo Place, Edinburgh, but the examples were generally deficient in size and colouring, and were not very clean.

Other exhibits were from Mr. W. Drummond, Stirling (good fruits of Beauty of Montreille, Ochitree, and Dunmore).

*New or little known Apples*.—In this class Mr. Vertegans showed a long, cylindrical Apple, yellow streaked with red. It is now down under the name of "Malus pendula." The fruits are about 3 or 4 inches in length, and 2 inches wide—probably a good decorative sort.

Messrs. R. Veitch & Sons, Exeter, contributed a collection containing varieties which are not often to be noticed on the exhibition table. They were all well coloured fruits of average size. We may mention Sandringham, Ottery, Rougemont, Bramley's Seedling, Warrington, Towsington, Smiling Beauty, St. John's Favourite, and Hollow Core—all of good prepossessing appearance.

Mr. C. Ross, Welford Park, Newbury, had some good samples of out-of-the-way fruits, as Grand Duke Constantine, Beauman's Reinet, Lady Alice Eyre, a pale round fruit; and Gospatric, a capital variety.

In Messrs. G. Bunyard & Co.'s collection, Okera, a dull red, slightly elongated fruit, was shown. It is of Swedish origin, and appeared in this country, we believe, for the first time in a collection of Swedish Apples shown at the last Conference in 1883. It is a sweet and tender-fleshed Apple, and was shown also by Messrs. J. Cheal & Sons, Crawley, and Mr. T. Bunyard Ashford, Kent. Messrs. G. Bunyard & Co. also had Cardinal, Belle Pointoise, Optien, Gospatric, Evagil, and Bismarck, in good specimens. Messrs. J. Veitch & Sons sent several dishes, King Harry, Ringer, Castle Magar, The Sandringham, and Niton House, showing up well. Messrs. Cheal had Professor and Ottershaw, and others were from Mr. C. Turner, A. H. Smee, Esq. (with Remsborough, a handsome dessert), Mr. Crump, and Mr. C. G. Slater, Exeter.

#### PEARS.

The exhibits of Pears were not so large as those of Apples, indeed the classes were very properly reduced, so that the large collection included thirty-six varieties as against fifty of Apples in the corresponding class. The general appearance of Pears in the mass is not so pretty as that of Apples, the colours being of a duller hue. When the season is considered the quality of the exhibits is of a high order, especially in the large classes; exhibitors seeming to place inferior samples in the smaller classes.

*HOMER COUNTIES.—Thirty-six Varieties.*—A handsome lot of fruits were those shown by Messrs. C. Lee & Son, Hammersmith, W. The entire lot was good in quality and very clean, in fact one of the best in the show. Pitmaston Duchess, Marie Louise d'Uccle, Souvenir du Congrès, Louise Bonne of Jersey, Trout, Beurré d'Amanlis, Mad. Treve, B. Hardy, Williams' Bon Chrétien, B. Clairgeau, Prince of Wales, Durondeau, B. Bachelier, Doyenné du Comice, and B. de Capiaumont were one and all remarkably fine and deserve mention.

Messrs. J. Veitch & Sons, Chelsea, were also exhibitors of a splendid lot, very clean and even throughout, that was about the best coloured collection; Doyenné Boussoch and Louise Bonne must be singled out as finely coloured samples, then followed Pitmaston Duchess, Souvenir du Congrès, Triomphe de Vienne, Van Mons Leon le Clerc, Durondeau, Clairgeau, and Madame Treve were also fine.

Messrs. J. Rivers & Sons also had a lot of large and clean fruits, some from under glass, we imagine. This collection was remarkable for the large size of its fruits; Pitmaston Duchess, and General Todleben, were specially noticeable in this respect; Doyenné Boussoch was finely coloured, and of the others the best were Emile d'Heyst, Duchess d'Angoulême Lebrun, Catillac, Grégoire Bordillon, and Marie Louise d'Uccle, all large and clean.

A very creditable collection came from Messrs. G. Bunyard & Co., generally well coloured and of large size. Catillac, Beurré d'Amanlis, Louise Bonne, Comte de Flandres, Souvenir du Congrès, Conseiller de la Cour, Doyenné du Comice, Beurré Clairgeau, Marie Louise d'Uccle, Beurré Hardy, and Doyenné Boussoch were all fine samples.

Messrs. J. Peed had a finely coloured lot, Doyenné Boussoch being the best, and good colouring was

also to be seen in Louise Bonne, Emile Heyst, Pitmaston Duchess, Marie Louise d'Uccle, Beurré Bachelier, B. Clairgeau, and B. Superfin.

An even collection of medium quality was shown by Mr. R. Smith, gr. to Lady Fletcher, Kenward, Yalding, Kent; Passe Colmar, Williams' Bon Chrétien, Beurré Bachelier, and Marie Louise being the finest shown.

Maréchal de la Cour, Uvedale's St. Germain, and Durondeau were good in the collection from Mr. C. Turner, Slough.

Messrs. W. Paul & Son, Waltham Cross, showed an average collection, generally wanting in size; the best fruits were those of Beurré Spence, B. Baltet Père, B. d'Amanlis, B. d'Anjou, Emile d'Heyst, General Todleben, Brockworth Park (Bonnie d'Ézée), Conseiller de la Cour, and Doyenné Boussoch.

Mr. J. Roberts, Gungersbury Park, showed superior well-grown fruits of Beurré Clairgeau, B. Diel, Nouvelle Fulvie, Catillac, Marie Louise d'Uccle, and Fondante d'Automne.

Messrs. Saltmarsh & Son, Chelmsford, showed an average lot of fruit; the best were Mad. Treve, Louise Bonne, Durondeau, Doyenné Boussoch, Beurré Hardy, and B. Clairgeau.

Mr. C. Howe, Benham Park, showed fruits of medium size: Beurré Rance, Doyenné Boussoch, Triomphe de Jodoigne, Zephirine Gregoire, Hacons Incomparable, Gansell's Bergamotte, and Knight's Monarch were the finest.

Messrs. J. Veitch & Sons, Chelsea, exhibited some excellent fruits, some of which may have been grown under glass; the best fruits were Doyenné Merode, Beurré Bachelier, B. Superfin, B. d'Amanlis, B. d'Anjou, Marie Louise, General Todleben, Napoleon, Conseiller de la Cour, Alex. Lambre, Fondante d'Automne, Pitmaston Duchess.

In the fruits shown by the Society in this class there were noticeable Louise Bonne, Beurré de Charnes, B. Diel, Jersey Gratioli, B. d'Amanlis, Souvenir du Congrès, Madame Treve, Napoleon, and Veneuse—altogether a first-rate lot, of fine size, clean and even.

In the twenty-four best adapted to the district the Society showed well again, with excellent fruits of Beurré Hardy, Louise Bonne, B. Superfin, Fondante d'Automne, Maréchal de la Cour, and B. d'Amanlis; but here, as in all the exhibits of the Society, colour was deficient, but the fruits themselves were fine.

Very similar varieties were well shown in the collection of Mr. J. Roberts, Gungersbury House, Acton, and again by Messrs. J. Veitch & Sons, Chelsea, who had fine fruits.

Mr. J. H. Rose, Lockinge Gardens, Wantage, had Beurré Clairgeau, Louise Bonne, and Doyenné du Comice, from walls, and all extremely brightly coloured.

Mr. A. Waterman, gr. to H. A. Brassey, Esq., Aylestone, showed Beurré Bachelier, Louise Bonne, Conseiller de la Cour, Gansell's Bergamotte, and Bonne d'Ézée in his collection.

Mr. Cummins, gr. to A. H. Smee, Esq., Wallington, Surrey, sent a nice neat lot also in the class, having King Edward, Beurré Rohan, and Durondeau in good specimens. Mr. T. Fletcher, Kingston, Herefordshire, and Mr. Griffin, Haverfordwest, also showed, but their exhibits do not call for special mention.

*Twelve varieties of dessert Pears best adapted to the exhibitor's district.*—Messrs. J. Veitch & Sons showed very nice examples of Doyenné Merode, Williams' Bon Chrétien, Beurré d'Amanlis, B. d'Arenberg, B. Diel, B. Bachelier, Bergamotte d'Esperen, and Fondante d'Automne.

Mr. J. Roberts, Gungersbury, showed excellent fruits of Nouvelle Fulvie, Conseiller de la Cour, Beurré Bosc, B. Bachelier, Van Mons. Leon le Clerc, British Queen, Louise Bonne, and Marie Louise d'Uccle.

Messrs. Saltmarsh & Sons, Chelmsford, showed fruits of quite an average as regarded size, and clear skinned. Beurré Hardy, B. d'Amanlis, Doyenné du Comice, Thompson's Souvenir du Congrès, Madame Treve, Pitmaston Duchess, and Marie Louise were the finest.

Mr. T. Richardson, 11, Eleanor Terrace, Barnes, had fair sized clear-skinned specimens of Beurré Rance, Bon Chrétien, Easter Beurré, B. Diel, B. Bosc, and Knight's Eyewood.

Messrs. Paul & Son, Old Nurseries, Chesham, showed medium-sized fruits of General Todleben, Fertility, Louise Bonne, Duc de Morny, Beurré d'Amanlis, Triomphe de Jodoigne, and Marie Louise d'Uccle.

*Twelve Pears, adapted for the district.*—Mr. J. Hudson, Acton, had Pears of good average quality

of the following varieties:—Bellissime d'Hiver, Pitmaston Duchess, Beurré Clairgeau, B. d'Amanlis, and Marie Louise.

*SOUTHERN COUNTIES.—Thirty-six varieties.*—The collection from Mr. G. Fragnell, Sherborne Castle, Dorset, showed some very fine specimens, others were only of average quality; this was in the class for thirty-six. Those best represented were:—Uvedale's St. Germain, Pitmaston Duchess, Beurré Clairgeau, Esperen, Autumn Nelis, Louise Bonne, Duchess d'Angoulême, Doyenné du Comice, Beurré Diel, Jersey Gratioli, Marie Louise, Beurré Hardy, Hesse and Passe Colmar, which were of fine colour and clean.

Messrs. J. Cheal & Sons also showed here with good sized fruits of Belle de Bruxelles, Alexander Lucas, Baltet Père, Beurré Hardy, Doyenné du Comice, &c.

*Twenty-four varieties.*—Among others they also showed here good sized fruits, but lacking colour. Forelle, Conseiller de la Cour, Madame Treve, Catillac, Clairgeau, &c., were well shown.

*Twenty-four varieties.*—Messrs. Lucombe, Pince & Co. had a collection of fruits showing generally much speckling of the skin; Pitmaston Duchess, Gansell's Bergamotte, and Napoleon were the better fruits.

*Twelve Pears.*—Mr. S. Ford, gr., Leonardslee, Sussex, in his collection had of fair size and appearance—Durondeau, Beurré Clairgeau, and Marie Louise d'Uccle. Mr. Wildsmith, gr., to Viscount Eversley, Heckfield Place, Hants, had a collection much above the average in size this season, and which in some cases were well coloured fruit. The best were—Doyenné Boussoch, Fondante d'Automne, Beurré Bachelier, B. Hardy, Doyenné du Comice, B. d'Ézée, Knight's Monarch. Many if not all these varieties were on the Quince. Mr. C. Turner, Slough, showed fine fruits of Beurré d'Amanlis, Hacons Incomparable, Pitmaston Duchess, and Doyenné Boussoch.

C. Bryner, Esq., Islington House, Dorchester, showed medium sized fruits, with clear skin, Louise Bonne, Beurré Sterckmanns, B. d'Amanlis, B. Rance, Suffolk Thorn, Glou Moreau, and Zephirine Gregoire were the finest.

*Six varieties of dessert Pears, best suited for the district.*—Excellent fruits, although not so finely coloured as some in the show were to be seen in the collection of Mr. W. Wildsmith, Heckfield Place Gardens, Winchester. They were all good and clean, including Pitmaston, Louise Bonne, Beurré Diel, Doyenné du Comice, Marie Louise, and Brown Beauty.

*WESTERN COUNTIES.*—Messrs. R. Smith, Worcester, showed in the collection of thirty-six varieties, of smallish size generally, but a few were of good size: Beurré Clairgeau, Pitmaston Duchess, General Todleben, Gratioli of Jersey, Colmar d'Été, Glou Moreau, and Louise Bonne being the best.

In the smaller class for twenty-four best suited to the district, Mr. T. Coomber, Hendre, Monmouth, showed several fine examples, stated to have been grown under glass on walls in several instances. Maréchal de la Cour, Flemish Beauty, Catillac, Durondeau, Madame Treve, Beurré de Capiaumont, Doyenné du Comice, and Bonne d'Ézée were grand fruits, and the whole lot was very clean and neat.

*Twelve Pears.*—Mr. Crump, Madresfield Court, Malvern, had fine well developed example of Josephine de Malines, Doyenné du Comice, Brockworth Park, Bergamotte d'Esperen, Pitmaston Duchess, and Glou Moreau. The fruits sent by Mr. T. Southall, South Bank, Worcester, were very inferior.

*MIDLAND COUNTIES.*—The fruits from the Midland district were very few. Mr. Parker, Impney Gardens, Droitwich, however, contributed a handsome collection of twenty-four best suited to his district, very clean and neat all through; Zephirine Gregoire, Brown Beurré, General Todleben, Gansell's Bergamotte, Duchess d'Angoulême, Pitmaston Duchess, Hacons Incomparable, and Beurré Diel were excellent fruit.

*Twelve Pears.*—Mr. R. Milner, Sundorne Castle, Salop, had very nice examples of Louise Bonne, Glou Moreau, Beurré Sterckmanns, B. d'Amanlis, B. Diel, Brockworth Park, Marie Louise d'Uccle, and Gratioli.

*NORTHERN COUNTIES.—Twelve Pears.*—Mr. Chuck, Brodsworth Hall, Doncaster, had highly coloured, rather small fruit, clear in the skin, of Beurré Diel, Doyenné du Comice, Maréchal de la Cour, &c.

In the collections of culinary Pears there was a fair display, Messrs. J. Veitch & Sons and C. Turner, Slough, being the chief exhibitors. Messrs. Veitch sent Catillac, Verulam, Vicar of Winkfield, Gilles-à-

Gilles, and Bellissime d'Hiver, in good and well-coloured samples.

Mr. Turner had Catillac, Clairgeau, Uvedale's St. Germain, and Beurré Diel.  
Messrs. W. Paul, Saltmarsh, and J. Hudson also showed good all-round fruits here. In the Society's collection, Uvedale's St. Germain, Vicar of Winkfield, Gilles-d-Gilles, and Besi de Louvade were to be seen.

**Fruits from Trained Trees, &c.**—The classes for Pears from various forms of trees were not responded to so well as they might have been. The fruits from walls shown by Messrs. W. & E. Wells, Houslow, and Mr. Charles Warden, Clarendon Park, Salisbury, were fine in form and size, but all lacked colour. Messrs. Wells had better looking fruits in the collection from pyramids, bushes, or cordons, Marie Louise d'Uccle especially so; and here were to be seen some really magnificent fruits from bushes under glass in pots from the Rev. W. Wilks, Shirley Vicarage, Croydon. Pitmaston Duchesse were beautiful, extremely large, and remarkably clear. Beurré Baltet père, Beurré Damont, Doyenné du Comice, Beurré d'Anjou, Josephine de Malines, and a large André Leroy were all remarkable fruits in the collection. Mr. W. Wildsmith also showed a fine lot of clean specimens of Pitmaston Duchesse (pyramids), General Tottleben (cordon), Beurré Diel (pyramid), Duchesse d'Angoulême (open cordon), Beurré Hardy (bush). The specimens in this section going far to prove the value of trained trees for obtaining the finest fruits. Fruits from standards were, however, excellent from Mr. R. Dean, Bedford; Messrs. Wells, and Mr. J. Watkins, Pomona Farm, Hereford. Mr. Dean had Dr. Jules Guyot as is best; and Souvenir du Congrès from Mr. Wells.

The Market Pears were as attractive as the market Apples, and it was in this class that Messrs. Wells showed some of the finest Pears to be seen in the show. Souvenir du Congrès was specially remarkable, and others were Pitmaston Duchesse, Doyenné du Comice, Louise Bonne of Jersey, Beurré Diel, and Hesle, all splendid samples.

Messrs. G. Bunyard & Co. also showed a fine lot here, and they were well coloured, too, especially Darondeau and Louise Bonne, Pitmaston Duchesse, Fertility, and Doyenné Boussoch were also well shown.

In the New or little known Pears there were but very few exhibitors. Messrs. J. Veitch & Sons were the chief, with five dishes, containing, among others,—Triomphe de Vienne, Princess, Beurré rouge, De Livre, B. Baltet Père, Williams' Victoria, Fondante de Malines, Admiral Cecil, among others, all looking well, and many of them creeping into favour. Messrs. W. Paul & Son had Merissa, Nevill, and Maude Hogg, Caroline Hogg; and A. H. Snee, Esq., sent Breadwell, a small green fruit with a red cheek.

**Miscellaneous.**—Mr. Allen, Gunton Park, Norwich, had some good clean fruit in a collection, the best being Maréchal de la Cour, Beurré Clairgeau and Mad. Treve, General Tottleben, Beurré Superfin, and Marie Louise d'Uccle, which were fairly large specimens.

Messrs. Dickinson, Limited, Chester, and T. Rivers & Sons, Sawbridgeworth, completed the chief exhibits.

## DISCUSSION ON THE PAPERS READ ON THE SECOND DAY (WEDNESDAY).

Dr. Hogg in the Chair. At the opening of the proceedings, the Rev. W. Wilks, Shirley Vicarage, Croydon, said they had had a request from the Melbourne Exhibition Committee to send out to them a representative collection of English Apples and Pears to be shown at the Exhibition in Australia. The request would be acceded to, and he intended to ask growers of Apples and Pears who were exhibiting here to be good enough to let Mr. Barron choose one or two specimens of different sorts and varieties which he should think worth sending out. Of course, sending out in that way was really sending a representation of what England could do, and he hoped they would not fail in giving their specimens for so good a purpose.

The Chairman said for some time past they had been treated to the observations of the theorist and doctrine as to what was the best way of developing fruit culture (in this country, but they had now come to the practical part of the exhibition, from which he had no doubt great good would result.

## APPLES FOR PROFIT.

Mr. BUNYARD read his paper, printed at p. 435. In the discussion which followed, Mr. LE MAITRE (Acton) asked whether he should prune back every year, or let the tree grow in its own fashion? Mr. SHIRLEY HIBBERD asked if The Queen was a marketable Apple?

Mr. WRIGHT said he had tried experiments on a small scale with regard to pruning, and although he had seen trees without being pruned doing well, on the whole the advantage had been in favour of pruning after planting. He thought it was wise to prune in the first year.

Mr. BUNYARD said he had every faith in The Queen becoming a very marketable Apple. It had one objection—that of being flat—and he knew market people had a preference for round Apples. It was, however, extremely beautiful and fertile, which placed it in the first rank. As to pruning pyramids the remarks which applied to standard trees after the second and third year were also intended to apply to dwarf trees. It would be necessary to preserve the dwarf trees by pruning, and it must be left to the judgment of the grower and the state of his soil as to whether he pruned in four or five years or not. In Kent it was the custom to prune very hard indeed, and he thought it was carried too far. He was of opinion that they might allow Nature to have her own way more. No Apple tree should be cut the first year of planting. Plum trees could be cut in the first year, but Pears and Apples and Cherries should be allowed to grow at their own sweet will.

Mr. ROUPEL maintained that removing a tree well answered the same purpose as pruning if it be done in its growth. The effect of removing a tree made it more fertile and obviated to some extent the necessity of pruning.

Mr. BUNYARD said when a tree was taken up the soil was seen at once. If three or four roots were found they were shortened down and removed—removing being only a common-place name for root-pruning.

Mr. SHIRLEY HIBBERD objected to that definition. Lifting and root-pruning were very different. Root-pruning as it was commonly understood was a barbarous business.

Mr. PEARSON (Notts) said the most profitable orchard apple in his district was the New Northern Greening. As to grafting he had found that old Apples were very impatient to work. Pears would stand it very well, but apples did not like it at all.

Mr. WOOD (Kent) said he grew seven acres of Councillors (or Yorkshire Beauty) and he did not know anything better to grow. It was one of the best Apples they could grow in Kent.

Mr. BUNYARD said that when market growers demanded a thing, they might be quite sure that it was a thing worth having, he had a very high opinion of the New Northern Greening, but he omitted it, wishing to speak from his own experience.

## FRUIT CULTURE FOR PROFIT.

Mr. PAUL then read his paper (see p. 436).

A gentleman asked why Mr. Paul left Jefferson out of the Plums?

Mr. PAUL replied that it was one of the finest Plums, but was not a sufficient bearer.

Another gentleman asked what was the age of the plants when put in the ground, if they were not to be pruned until four or five years; and Mr. Paul replied two years.

A question was asked whether it was legal for the tenant mentioned in the paper to clear away his Strawberries?

Mr. WOOD (Kent) said it was legal to clear away Raspberries and Strawberries and such-like, but not Pears or Apples.

Mr. DEAN (Houslow), replying to a further question, said a market gardener had no power to destroy his top trees except he replaced them by others. He was, however, entitled to destroy what was known as ground crop. Trees should not be looked to to return a profit under four or five years, during which time an income might be derived by planting under them Violets, Wallflowers, &c.

Mr. SHIRLEY HIBBERD, speaking on the subject of frost, said its effects were different according to the state of the atmosphere. At 10 feet above the surface frost was usually less intense than immediately in contact with the surface. There was more risk up to 10 feet than above it.

Mr. PAUL said that was not so always, as sometimes they had a better crop of fruit at the bottom of trees than at the tops. But as a rule the frost was more severe close to the ground, especially in

spring and autumn, than it was at certain heights; but he did not think it was universal.

Mr. ROUPEL said, that a cutting wind at the top was worse than a frost at the bottom. A Duchesse Oldenburg Apple was in full bloom in 10° of frost, and remained uninjured, while taller trees were very much more affected, because of the wind blowing a gale.

Mr. LE MAITRE (Acton) asked why British Queen was omitted from the Strawberries?

Mr. PAUL replied, that he had a high opinion of the British Queen, but he should not plant it for market. He preferred Dr. Hogg.

Mr. TONKS could quite understand why it was left out. He grew a large number of Strawberries, but he could not get the British Queen to fruit at all on his ground.

Mr. T. BUNYARD spoke as to the effect of climate on fruit trees. Everything had been considered but dew. He had noticed on fruit trees, that while the lower branches had been saturated with dew the upper branches were quite dry. He thought frost would have a more injurious effect on dew-saturated blossoms than on the dry ones. The water got in and ruptured the germ, and there was an end of the fruit.

Mr. PEARSON, speaking on the subject of "sticking trees," said one source of trouble and disappointment was, that trees were planted nearly always three times too deep. He could not consider anything more unjust to the fruit tree than to have its roots shoved down so deep, so that it could not get sun or air. He was against deep planting, and he would suggest that planting should be done on a mound. The more they prepared the land the better would be the results. He said there was always a mark round the tree as it grew in the nursery, and if they planted to the same point again they could not go wrong.

Mr. SHIRLEY HIBBERD said he should like to point out a source of danger in private gardens where "sticking in" was done. Wherever a tree had been for any considerable length of time it was dangerous business to plant another in the same spot, for nine times out of ten there would be in the soil a residue of the old roots which would breed a mass of fungus.

Mr. DEAN said his rule was to plant Plums where Apples had been, as while Plums took one constituent out of the soil, Apples took another.

Mr. WILDSMITH then read his paper (see p. 437) on

## DESSERT PEARS.

Mr. TONKS asked why Jargonelle was left out of both lists?

Mr. WILDSMITH said he had a conscientious objection to the Jargonelle, as it went to sleep too soon. Replying to a question as to the nature of his soil, Mr. Wildsmith said it was a sandy gravelly loam. It was not a bad loam if it was well done, but it was no use digging it—as digging was understood. He never dug a bit of ground but always trenched, even for cabbages. He found no difficulty in growing Pears of a very good quality on a sandy gravelly soil.

A gentleman inquired how he had ripened successfully some Josephine de Malines by placing them on the hot air pipes for ten days, when their owner, who had discarded the tree from which they were taken, praised them highly.

Mr. WILDSMITH said he had also ripened the late Pear, Bergamette Espere, in the same way.

## PRUNING.

Mr. SHIRLEY HIBBERD then read his paper (see p. 438).

Mr. PEARSON thought Mr. Hibberd rather meant to talk about bad pruning v. good pruning than the non-necessity of pruning.

Mr. WRIGHT said the longer he lived the less he should use the knife in pruning if his object was to get the greatest possible amount of fruit. He referred to the Pear trees at Cardiff Castle, and said they had been allowed to assume their natural habits, the pruning they had been subjected to being the taking out of a few branches here and there so that the sun could shine through. Those trees were bearing 3 or 4 bushels of fruit as good as could be found in the exhibition. The great object was to let light shine through the trees, which would then form natural spurs. There were, however, in the garden some good examples of pruning and non-pruning. On the whole, for commercial fruit growing, people, Mr. Hibberd, he considered, was right in his principles and philosophy.

Mr. LE MAITRE said they had been talking about standard trees, but did the same remarks apply to wall trees?

Mr. SHIRLEY HIBBERD, in reply, said he was pleased to see that the general concurrence of opinion was with him. The trees at Cardiff Castle were very interesting, as illustrating this question. He did not say anything about wall trees, because he considered one subject enough at a time; but he would say—give wall trees plenty of room, and do not stunt the shoots. In conclusion, he moved a vote of thanks to Dr. Hogg for presiding.

Rev. W. WILKS, Secretary, Royal Horticultural Society, proposed a vote of thanks to the readers of papers.

Mr. PAUL returned thanks for the readers, and said he had seen many barren trees made fruitful and many fruitful trees made barren by the pruning knife. They could not, however, do without pruning. It was injudicious pruning that should stand condemned. It would not do for the idea to get abroad that they were of opinion that there was no necessity for pruning, as such a wrong impression might lead to serious consequences.

The proceedings were adjourned till Thursday.

### NATIONAL CHRYSANTHEMUM SOCIETY.

OCTOBER 16TH.—A General Meeting of members of this Society took place at Anderson's Hotel, Fleet Street, on Monday evening, the 15th inst. Mr. E. Sanderson, President, in the chair. The Hon. Sec., Mr. W. Holmes, reported that the Midland Railway Company had offered to convey exhibits to and from the provincial show at Sheffield on November 16 and following day, at a single fare, provided the exhibits remained until the close of the show. Also that they were willing to reserve one or two saloon carriages, if a sufficient party going from London justified them in doing so. The Hon. Sec. also reported that he had paid the sum of £70, prizes awarded at the September show at the Royal Aquarium, and said he thought it would be necessary to modify the classes for Dahlias. A hearty vote of thanks was passed to those who acted as stewards on that occasion. Mr. Harman Payne, the chairman of the Catalogue Revision Committee reported that their labours as revisers had come to an end.

The following resolution was then moved by the Hon. Secretary, seconded by Mr. Geo. Stevens, and carried by acclamation:—"That the members of the National Chrysanthemum Society desire to place on record their high appreciation of the valuable work accomplished by those who prepared and published the edition of the National Chrysanthemum Society's Catalogue for 1888. To each of those who constituted the specially selected committee, and who prepared reports on the several sections, the members give their sincere thanks, and especially to the Revision Committee, who received these reports, revised and tabulated them. Further, that a Silver Medal of the Society, duly and suitably engraved, be presented to Messrs. Lewis Castle, C. Harman Payne, and George Gordon, in recognition of the admirable result of their painstaking and arduous work; also that a copy of this resolution be entered upon the minutes, and a lithographed copy be prepared and furnished to each member of the committee." The Hon. Secretary also proposed a resolution for the appointment of a permanent Catalogue Committee, to take such notes as may be necessary with a view to revision of the Catalogue at a future time, and that such committee consist of Messrs. Payne, Castle, and Gordon.

### FRUITS UNDER GLASS.

PEACHES.—Where fruit is hanging on the trees in late houses give as much sunlight as possible, so as to impart flavour; a little artificial heat will prove of great service, as well as of benefit to the formation of the fruit buds. While applying heat give ventilation in moderation, and shut up with dry sun-heat when it can be secured.

Succession-houses.—Trees in these, when thinned of all old bearing wood and freely syringed, should be watered at the roots if this be found necessary, and the foliage allowed to fall naturally.

The Early House will require attention now. If it be not already done all internal cleansing and painting should be done, and all rough snags and wounds cut smooth with the knife, so that the earth may close properly over them. In pruning remove all such of the old bearing wood as can be spared, and that which was left from the summer pruning; any very gross shoots of this season's growth may also be cut out. As a rule, I do not favour the shortening back of bearing wood on Peach and Nectarine trees, but if one side of the tree is likely to outgrow the other it becomes a necessity for the proper balance of the tree. Wash the shoots with a soft brush and warm water, in which some soft soap and a few handfuls of flowers of sulphur have been dissolved. When all has been thoroughly cleaned fasten the shoots to the trellis, allowing the shoots plenty of room to swell. Shoots from 5 to 7 inches apart will be quite close enough. Prick up the surface of the border and remove all the soil down to the roots. Dust the border over with a good dressing of Thomson's Manure and resurface with loam, lime rubbish, and charred wood ashes; place a few inches of horse-droppings on the top, and give a good soaking of tepid water. The outside border should also be covered with 14 to 15 inches of dry leaves, and thatched with straw.

Figs.—The early plants in pots or tubs should now be placed under protection, and the pruning seen to at once. If ripe Figs are expected in April, the plants will require to be started next month. In pruning remove all the weakly shoots which were left at the summer's pruning. The strong shoots should be but as little as possible; rather bend them down and depend on heavy cropping and summer pinching to reduce any grossness of shoots from all the snags and wounds, so as to afford but little hiding-places for insects; then well wash the wood several times over with hot water, soft-soap, and petroleum. If not already done, let the house they are intended to occupy be well scrubbed and painted if necessary. Wash the walls with hot lime and flowers of sulphur. *W. M. Baillie, Luton Hoo.*

### DISBUDDING ROSES.

As "Wild Rose" does not seem to think it worth while to comment further on the question of disbudding Roses, the temptation to risk breaking a lance against "Rosa's" protest on p. 38, is irresistible.

"Rosa" leads off with a gibe against the exhibitors for their insufficient taste, and then proceeds to refer to "over full-blown Roses, however beautiful, &c." Does "Rosa" really consider "over full-blown Roses" at all beautiful? Such is certainly not the opinion of exhibitors. Perhaps the meaning of the word taste requires definition; for, after all, is *Maréchal Niel* so old that he is to be mocked as "virtually" (why virtually?) a bald-head?

"Why, indeed," says Rosa, "should the amateur who grows his Roses for their beauty in the garden or in the house, pinch out their side buds?" It is quite easy to imagine that "the rustle of their opening buds" was loud enough to prevent "Rosa" from hearing the Rose's obvious answer to this question, which is simply, that otherwise the amateur would fail in his alleged object, as his Roses would never attain their highest beauty either in the garden or anywhere else.

When Roses are not disbudded they are never seen in character, that is to say, they lack colour, depth, substance, and frequently form. This, of course, does not apply to what may be termed cluster or bud Roses, but it does apply most emphatically to the majority of hybrid perpetuals and to many Teas. To take a solitary instance from each class, few amateurs who have never disbudded *La France* have any conception of the richness and depth of colour that may be obtained in that variety when the flower-buds are well thinned out, and of the hardly more than semi-doubleness of *Madame de Watteville* when the myriad buds are all left on, growers who have made the experiment of blooming that lovely Rose without disbudding are only too well aware. It has been frequently urged as an objection against *La France* in the cut state that the flowers so soon assume a faded lilac tint; but if the flowers are

vigorously disbudded the colour becomes so intensified that the objection no longer holds good.

As for "Rosa's" appeal to the fair sex to decide between Roses disbudded or otherwise, it is perfectly certain and well known that the ladies, to a man (if the Hibernicism may be pardoned) invariably vote for the exhibitor's handsome blooms. It is not a matter of opinion, but of well known fact, that, however many gardens there may be in a neighbourhood where Roses are never disbudded, it will not be to them, if there be a single exhibitor's garden within reach, that when Rose blooms are wanted, the ladies will go; they know well enough how much richer will be the colouring of the exhibitor's flowers, and, more important still, how much longer they will last in water than blooms surrounded by buds, whose sole effect is to make the truss top-heavy and unmanageable in any vase arrangement.

Even on the score of beauty these surrounding buds are frequently, in the case of hybrid perpetuals, indefensible; for the buds of many varieties are eminently ungainly, both in form and texture, and they nearly always afford lodgment to aphides and mildew—neither very pleasant adjuncts to a lady's flower. Again, in some varieties the surrounding buds are so close to the central axis that they are quite concealed from view by the central flower when it is expanded, and in other varieties their peduncles are so long that the buds stand up beside and (especially in wet weather) frequently disfigure the outer petals of the bloom they surround. In the case of such varieties, moreover, these buds are sometimes the means of actually precluding the successional bloom they are alleged to ensure, for they prevent the full expansion of the main bloom, whose petals consequently rot without falling, and as the side buds attempt to develop are the cause of their disfigurement or failure to open. After all, the "procession of bloom" supposed to be provided by the side buds is not so very long, since the buds do not open one after another, as in many other plants, but as soon as the central bloom has been disposed of, the surrounding three or five buds proceed to expand as best they can all together, and the crowded bunch of little flowers produces no greater effect of colour in the garden than would one bloom with opportunity to develop.

To say that "we hear more complaints every year of the shortness of the Rose season" is to make a statement impossible of substantiation; but it is not by allowing Rose trees to carry more blooms than they can properly develop that the blossoming time in the Rose garden has been and is being annually extended, but by the increased cultivation of so-called summer and single Roses, which bloom so early, and add almost a month at the beginning of the Rose time; by the far more general planting of the Teas that flower early and late, and add to the season at both ends, and by the increasingly perpetual character obtained in recent novelties.

That rose-blooms look best, in the majority of cases at any rate, upon their parent branch, is a contention that few will oppose; but to insist that no Rose can ever look its best unless surrounded by side buds is entirely beside the point, since it assumes that all Roses have many-flowered trusses which, of course, is not the case. Not a few varieties produce, under ordinary circumstances, solitary flowers, notably all the Baroness Rothschild group and *Gloire Lyonnaise*, Roses which presumably "Rosa" will hardly consider unattractive.

However charming *Gerrard Lewis's* verses may be, they clearly show that he was not a practical rosarian, or he would never have propounded such a fallacy as that a Rose bloom will last "long summer days" upon the plant, though only a few hours in the cut state. While no hybrid perpetual will last through more than one hot July day it is notorious that by cutting a bloom in the early morning its greatest beauty will so be longer preserved than by any other means. Browning was undoubtedly a closer observer; that he knew well enough that a burning July day was the term of a "red red Rose's" life, and that its beauty was too fleeting for any

enjoyment of it to be long protracted, is clearly shown in his answer to his own question—

"Then how grace a Rose? I know a way!  
Leave it, rather,  
Must you gather?  
Smell, kiss, wear it—at last throw away!"  
Theda.

## PLANT NOTES.

### SOLANDRA GRANDIFLORA.

This plant grows freely but flowers rarely, such, at least is my experience of it. In the Palm-house at Kew it makes enormous growth annually, and although this growth is ripened and baked as much as possible, still no flowers are produced. In the Succulent-house, however, it has behaved better, no doubt because the treatment it gets is more favourable to the production of flowers. The stems are trained along close to the roof, and from these there spring numerous lateral branches, upon most of which there is now either a flower or bud. Each flower is 5 or 6 inches long, trumpet-shaped, and 4 inches across the mouth; the colour is creamy-white. The species is a native of the West Indies, where it is common in hedges, &c. It was introduced in 1817. It seems to be variable in its time of flowering, the months of January, March, and July being given, and now it is flowering in October. *W. B.*

### ARUNDINA BAMBUSÆFOLIA.

The Arundinas are graceful plants, with slender, reed-like stems, 3 to 4 feet in height, clothed from the base with long narrowly lance-shaped leaves. The above species, although not common in cultivation, is one of the prettiest Orchids flowering at the present time. The inflorescence is a loose, terminal raceme, the flowers of which open successively and measure 2 inches across; in appearance they resemble a small Lobelia. The broadly lanceolate sepals and petals are white, flushed with pale rose, the lip being rose-purple with a white throat. A good specimen is in flower at Kew. This Orchid should have a place in the East India-house, and being terrestrial requires to be grown in a compost of fibrous peat and loam. It has none of the characteristic fleshiness of Orchids, either in leaf or stem, and must, therefore, not be subjected to a severe drying-off at any time. *W. B.*

## BANANA CULTURE IN NICARAGUA.

Under the title of *Banana Cultivation on the Rama River, in the Mosquito Reserve, Republic of Nicaragua*, a Consular Report specially devoted to this subject has recently been issued from the Foreign Office, of which the following is the substance:—

This trade, it seems, has entirely sprung up during the last few years, the first shipment of Bananas for exportation having been made in 1883. The river Rama flows from the junction of two small streams, the rivers Escondido and Sequia, to the Bluefields Lagoon, on the Atlantic coast, a distance of some ninety miles, and previous to the year 1883 the banks of these rivers were uncultivated and uninhabited. About that time the Mosquito Fruit Company cleared a tract of land, with a frontage of three miles, on the river Rama, and commenced the cultivation of Bananas. The first shipment, consisting of about 500 bunches, was made in the latter part of 1883, the fruit being sold at the vessel's side at the rate of 50 cents (Nicaraguan currency) per bunch. The success that attended this first attempt induced many persons, including several foreigners, to commence the cultivation of Bananas, and now the whole of both banks of the Rama River, commencing from about 20 miles from the Bluefields Lagoon up to the junction of the rivers Escondido and Sequia, and such parts of the last-named rivers as are navigable for canoes, have been cleared and cultivated. The banks of the Rama River, for about

twenty miles from Bluefields, are not adapted for cultivation, being too low and swampy. The following figures will show the rapid growth of the exportation of Bananas from this country:—In 1883 the number of bunches exported was 8000; in 1884, 40,000; in 1885, 45,147; in 1886, 154,434; and in 1887, 255,332.

To ship the Bananas during the year 1887 there were six steamships, each making monthly trips to the United States, where the whole of the fruit is sold; two of these steamers carrying their cargo to New Orleans, three to Baltimore and Philadelphia alternately, and one to New York. These steamers have not only to be fast, to enable them to arrive at their destination before the fruit ripens—as it has to be cut whilst still green, and handled with the greatest care, the slightest bruise leaving a black mark, and consequently depreciating the value of the fruit—but the steamers have also to be of light draught, to enable them to pass the bar of Bluefields Harbour, which has only some 14 feet of water. Once inside the bar, the steamers proceed up the Rama River, which has a considerable depth of water—in some places as much as 50 feet—and, calling at the various plantations on the river banks, purchase the Bananas that may be ready. In consequence of the greater part of the planters refusing to accept the low prices offered by the steamers, many of the vessels have been withdrawn, leaving, at the present time, it is stated, only two steamers making monthly trips—both to New Orleans—and in consequence a large quantity of fruit has ripened in the hands of the planters, and has rotted, for want of means of transportation.

A plantation of 10,000 Bananas would cost, including clearing the ground and planting, about 10,000 dols. currency. It would commence to give fruit in nine or twelve months after planting, and would last about five years; after that time the ground becomes exhausted, and the fruit so poor as to be unmarketable. The Bananas grown on the Rama River are the ordinary yellow Banana, about 6 to 8 inches long, and a red variety known as the "Patriota." This is smaller than the yellow form, but has a sweeter and finer flavour.

When the Bananas are stowed away in the steamers they have to be kept shaded from the sun, and the temperature whilst in the tropics must be kept as low as possible by means of a free circulation of air; but in spite of all precautions, some bunches always ripen and are lost during transit, and in some cases owing to the steamer having been obliged to batten down her hatches from heavy weather, or other causes, the whole of the cargo has been lost. According to the rules of the trade, eight clusters, or hands (as they are technically called) to a bunch forms a whole bunch; bunches having from five, and under eight clusters, or hands, are counted as half-bunches; and, as a rule, the steamers refuse to take at any price bunches having less than five clusters. *J. R. Jackson.*

## Obituary

**THOMAS HENDERSON.**—Horticultrists in England and Ireland will learn with deep regret that Mr. Thomas Henderson died on the 10th inst. at 2, Fairfield Terrace, Templeogue, Co. Dublin, after a painful illness, extending over four years. The deceased served as foreman to Mr. R. B. Matthews, Belfast, afterwards with Mr. Hugh Dickson, Belmont, proceeding from there to Messrs. F. & A. Dicksons, of Chester; his last situation was at Pesbrook, Titchfield, Hants. He was a skillful plantsman, ever ready to impart his knowledge to his subordinates and less fortunate of his craft; he was a strict master, but one of the kindest, and generous to a fault, while his modest and unassuming disposition gained him many friends, all of whom, I am sure, will join me in this tribute of respect for a friend taken from us at the early age of thirty-five. He leaves a widow and two sons to mourn his loss. *R. Weller.*

**RICHARD JOHNSON OF MARBURY.**—The death at the ripe age of 81 years, is announced of this fine illustration of the gardener of the old school, practical and successful, but modest and retiring. He was particularly skilful in fruit growing. For 51 years he acted as gardener in the service of C. H. Poole, Esq., Marbury Hall, Cheshire and Whitechurch, Salop. Mr. Johnson leaves one son, a nurseryman at Lindow Common, Wilmslow.

## THE WEATHER.

[Accumulated temperature indicates the combined amount and duration of the excess or defect of temperature above or below 32° F. for the period named, and is expressed in Day-degrees—a "Day-degree" signifying 1° continued for twenty-four hours, or any other number of degrees for an inversely proportional number of hours.]

## THE PAST WEEK.

The following summary record of the weather for the week ending Oct. 15, is furnished from the Meteorological Office:—

"The weather has been unsettled and rainy in the extreme north of Scotland, but in all other parts of the kingdom the condition has been generally fine and dry.

"The temperature has continued below the mean in all districts except 'Scotland, E.' The deficit, however, has not been so large as that of last week, having ranged from 1° to 4° in most of our eastern and northern districts to 5° or 6° over our eastern, central, southern, or south-western England. The highest of the maxima, which were recorded on the 12th at most of the English stations, and on various dates over Ireland and Scotland, ranged from 56° in 'England, S.W.', to 63° in 'England, S.', and 64° in 'Scotland, E.' The lowest of the minima, which occurred generally at the beginning or towards the end of the period varied from 35° to 30° in most parts of England, from 26° to 28° in Ireland, and from 26° to 32° in Scotland. In 'England, N.E.', the lowest reading was 34° and in the 'Channel Islands, 35°'. During the night of the 14th—15th thermometers exposed on the grass over the inland parts of south-western, southern, and south-eastern England fell to between 21° and 24°.

"The rainfall has been less than the mean. The fall has been very slight in all districts excepting 'Scotland, N.'"

"Bright sunshine shows an increase over some of our more southern and south-western districts, but a decrease elsewhere. The percentage of the possible amount of duration ranged from 10 to 23 in Scotland, from 24 to 40 in Ireland, and from 28 to 52 over England. In the 'Channel Islands' the percentage was 55."

#### MEAN TEMPERATURE OBSERVED AT CHISWICK DURING THE WEEK ENDING OCT. 27. (AVERAGE OF FORTY-FOUR YEARS.)

## MARKETS.

### COVENT GARDEN, October 18.

[We cannot accept any editorial responsibility for the subjoined reports, which, however, are furnished to us regularly every Thursday, by the kindness of several of the principal salesmen, who revise the list, and who are responsible for the quotations. It must be remembered that these quotations represent averages for the week preceding the date of our report. The prices depend upon the quality of the samples, the supply in the market, and they fluctuate, not only from day to day, but often several times in one day, and therefore the prices quoted as averages for the past week must not be taken as indicating the particular prices at any particular date, and still less can they be taken as guides to the prices in the coming week. Ed.]

A few Canadian Apples to hand this week, but poor samples. Market well supplied generally, with dull trade. Kent Cobs in short supply, with a tendency to rise. *James Webber, Wholesale Apple Market.*

S.* 6, Ribston Pippin; 3, Cellini; 2, Emperor Alexander; 1, Graevenstein; 4, Margil; 5, Blenheim Orange; 1, Chaumontelle; 2, Beurré Bosc; 3, Maréchal de la Cour; 4, Winter Crassane; 5, Easter Beurré; 6, General Todleben; 7, Beurré Rance; 10, Bellissime d'Hiver.

NAMES OF PLANTS: G. M. Ollivet, Loiret. 1, Cyripedium, probably seligerum: flower decayed; 2, Odontoglossum grande; 3, Oncidium curtum: a fine variety; 4, Cyripedium: decayed, and colour gone; 5, Lælia Perrini; 6, Lycaste plana: a bad variety of it; 7, Lycaste sp.; 8, Lycaste Skinneri; 9, Lælia elegans var. probably: specimen bad; 10, Masdevallia infracta; 11, M. corculata; 12, Scuticaria Steelii; 13, Odontoglossum grande; 14, Phalaenopsis antennifera; 15, Pleione (Colognye) lagenaria; 16, Trichomanes suavis; 17, Cyripedium (Selenipedium) Schlimii; 18, Odontoglossum Inseleyi; Phalaenopsis Esmeralda. Our correspondent is unreasonable. We cannot undertake to name more than six another time. An editor's duties are quite heavy enough without superadding the naming of plants, though we are always very desirous to oblige as far as we can.—C. E. I., no specimen; 2, Cupressus Lawsoniana; 3, Thuja gigantea (true); 4, Thuja (Thunbergia) borealis; 5, Cupressus Lawsoniana; 6, Picea Menziesii.—*Subscriber*. 1, Thuja plicata (Warrena); 2, Juniperus virginiana; 3, Thuja plicata; 4, Quercus cerris; 5, Fagus sylvatica laciniata; 6, Acer rubrum; 7, Carpinus Betulus. The Plane is Platanus orientalis.—*W. S. C. P.* (next week).—*H. A. J.* (next week).—*A. K. D.* (next week).—*Geo. House*. Hæmanthus coccineus.—*F. W. B.* Colchicum variegatum.—*T. D.* Can you not send a better specimen? It is allied to the Oleander.—*H. E. F.* 1, Oncidium varicosum; 2, O. prætectum; 3, Odontoglossum Rossi.—*Mac*. 1, Metrosideros floribunda; 2, Diosma ericoides; 3, Hoffmannia; 4, Calliandra purpurea; 5, Pilea muscosa; 6, unrecognisable.—*A. C.* 1, Cratogeomys coccinea probably; is it thorny? 2, Cotoneaster affinis.

NOTICE.—Will W. S. Melton, for whom we named a caterpillar in the number for September 29 last,

communicate with Mr. J. Birkenhead, Fern Nursery, Sale, near Manchester?

ONIONS: E. A. K. Onions ripened generally so badly this year, and are in consequence in a very sappy condition, that the loss in drying will be considerable, but how much we are unable to state definitely. The bulbs are likely to keep badly.

ORCHID PEAT: Mr. A. Johnson, of the Stanley Nurseries, Wilmalson, Cheshire, sends us a specimen of Orchid peat consisting almost entirely of clean fibre, well suited for its purpose.

MEALY-BUG ON VINES: B. H. In our Calendar, "Fruits under Glass," in our last issue, there will be found excellent means described of getting rid of this insect. It may be stated further that a keen look-out must be kept for it during the summer, and wherever seen to touch it with methylated spirits.

REMOVING TREES PLANTED IN NOVEMBER LAST YEAR: G. B. Do so at once; last year's removal will have resulted in a multitude of small roots which will at once seize on new soil on removal. Mulch with straw manure, and do not prune next season.

TREE TOMATO AND MELON PEAR: W. H. M., Munches. Both plants require hothouse treatment and a certain measure of root confinement if much fruit be expected. The treatment afforded Muscat Grapes would suit both during the summer months.

VARIETIES OF NECTARINES AND PEACHES TO PLANT: G. Five Nectarines: Goldoni, Lord Napier, in August; Newton, Rivers' Orange and Dante, in succession during September. Five Peaches: Hale's Early, Mignonne Gros Early, the large flowered variety; Stirling Castle, Lady Palmerston, and Sea Eagle, coming in in the order named. We should plant these varieties in preference to your own selection, the fruits being finer, and the succession a longer one.

\*Correspondents sending plants or fruits to be named, or asking questions demanding time and research for their solution, must not expect to obtain an answer to their enquiries in the current week.

DIED, at The Gardens, Villa Rothschild, Hohenwart, Vienna, on the 1st inst., aged thirty-six, suddenly, GEORGE WATSON ROSSON, only son of the late John Robson, formerly of Creswell Hall, Northumberland, greatly loved by all his friends, and highly esteemed by all his colleagues. His early death is deeply regretted.

BEFORE PLACING HER ORDERS EVERY LADY SHOULD SEE

By Special Appointment  
to the Queen.**ROBINSON & CLEAVER'S**By Special Appointment  
to the  
Empress of Germany.**SPECIALLY SELECTED DRESS FABRICS,**

Which are the very best and in the latest fashion.

They include Selections (only) of all-Wool, and Mixed English, Scotch, Irish, French, German and other Continental fabrics, from 5d. per yard single, and 1s. 9d. per yard double width, to the very best qualities made. Also Selections in Silks (warranted to wear well), Satins, Poplins, Velvets, Velveteens, Plushes, &c., at such prices as cannot fail to secure Patrons.

**LADIES,** it has been remarked, usually find a considerable amount of difficulty in making a selection from a large parcel of patterns, and are confused and puzzled by the multiplicity of the materials submitted for inspection. We profess to have reduced this difficulty to a minimum, and our patterns of English, Scotch, Irish, French, German, and other Continental dress fabrics, are so carefully chosen and such taste is shown in their selection, that we believe no intending purchaser can find the slightest difficulty in making up her mind, for she will find exactly what she wants ready to her hand. Thus time and trouble are saved by our method, which, the fashion journals say, "cannot be too highly recommended." Indeed, the success which has attended the sale of our "selections" has now become so generally appreciated that many Ladies prefer to send direct to Belfast, thereby saving very considerably in price, while securing the very latest Novelties. Patterns, Post-free.

### Estate Sales.

The best Country medium for Advertising Sales of

**THE WORCESTER HERALD**, the largest and leading County paper. Extensive circulation among the upper and middle classes in Worcestershire and adjoining counties. Advertisers would do well to forward for reference and distribution, plans and particulars of Estates, Catalogues of Machinery, Furniture, Books, and other property advertised in the columns of the *Worcester Herald*. Specimen copies sent free. Published Friday for Saturday, price 2d.

Offices, 72, High Street, Worcester.

### Sales of Stock and Agricultural Effects.

**THE WORCESTER HERALD** is the most effective organ for giving publicity to announcements of this class. It is the largest and leading Agricultural paper in the county, and circulates most extensively among Agriculturists in and around Worcestershire. Specimen copies free. Published Friday for Saturday, price 2d.

Offices, 72, High Street, Worcester.

### Farms to be Let.

LAND AGENTS, ESTATE MANAGERS, and all having Farms to Let, would do well to advertise in

**THE WORCESTER HERALD**, the Largest and Leading County Paper. Specially adapted for bringing such notices before Tenant Farmers. Large Circulation, moderate charge. Specimen free. Price 2d. Published Friday for Saturday.

Offices, 72, High Street, Worcester.

**WANTED A HEAD WORKING GARDENER**—Must thoroughly understand the high-class Culture of Flowers and Fruit; also Herbaceous Plants—very few Orchids. Thirty miles from London. Good character required.—Apply by letter to W. CATTLEY, 95, Belgrave Road, London, S.W.

**GARDENER WANTED.**—A Committee of the Vestry of the Parish of Bermondsey will meet at the Town Hall, Spa Road, S.E., on Tuesday, the 30th instant, at 7 o'clock in the evening precisely, to receive applications for the situation of Gardener. He will be required to work in the two Recreation Grounds, formerly Saint Mary Magdalen and Saint James' Churchyards, and also to attend to the Trees in the Streets. Age not to exceed 40. The wages will be 25s. per week. Candidates will be required to attend the Committee at the time of Meeting as above. Applications accompanied with three testimonials as to character to be sent in before the hour of meeting, addressed "Applications for Gardener." Canvassing is strictly prohibited.

By order, J. HARRISON, Clerk.

Town Hall, October 17, 1888.

**WANTED, a GARDENER**, for Bourne-mouth, who can cultivate a Small Kitchen Garden and attend to a Conservatory and Pleasure Garden. Wife as Cook.—Apply, stating ages, wages, &c., to E. V. S., 4, Magdalen Street, Oxford.

**WANTED, a GARDENER**, for situation in suburbs of London. Age between 30 and 40, married (without children). Must be an intelligent man, with knowledge of plants, including Orchids. Wages, 30s. per week, with lodge at gate (to attend to), light, and firing. One assistant.—M. N., *Gardeners' Chronicle* Office, 41, Wellington Street, Strand, W.C.

**WANTED, a GARDENER**, age under 37, thoroughly experienced in all branches, including Packing and Disposal, and practical in Keeping a Proper Book.—Must have exceptional references as to character and ability.—State qualifications, &c., by letter only, to C., 11, Beechholm Road, Upper Clapton, E.

**WANTED, a thoroughly experienced GARDENER.** Must understand Vinery, &c. Three in garden, which is large and practical in Keeping a Proper Book.—Bey H. E. TROTTER, Ardington Vicarage, Wantage.

**WANTED, a young man, as GARDENER**, and to manage Cocks, Pigs, &c.—Married, no family. Wife to do Dairy and Poultry.—M. A., *Gardeners' Chronicle* Office, 41, Wellington Street, Strand, W.C.

**WANTED, a thorough MARKET GARDENER**, used to Growing for Covent Garden, well-up in Tomatoes, Mushrooms, and Early Forcing of Vegetables, Flowers, &c. Good reference as to character and ability required.—Apply, with full particulars, to C. H. RANSOM, Nurseryman, Bournemouth.

### WANTED, a WORKING FOREMAN, to

Manage a small Nursery in S.E. suburb.—Married; to live on premises. Grapes, Tomatoes, Cut Flowers, and Nursery Work generally.—Terms and particulars to R. Z., *Gardeners' Chronicle* Office, 41, Wellington Street, Strand, W.C.

### WANTED, a NURSERY PROPAGATOR—

a rising young man, who has been in a Country Nursery, and can grow and propagate two things—Clematis and Rhododendrons. He must start at a moderate wage, and be well up in the business, and be proved in his capability and reliability.—CHARLES NOBLE, Bagshot.

**WANTED, AT ONCE, a good Outside NURSERY HAND**, well acquainted with Lifting, Planting, and the general routine of Nursery Work. A permanent post, for a suitable man.—State full particulars to J. W. SILVER, Streatham and Norbury Nurseries, S.W.

**WANTED, an energetic young MAN**, quick at Potting, Watering, &c., to work under Glass. Must have good knowledge of Indoor Work.—LANE AND MARTIN, Nurserymen, 327, Erixton Road, S.W.

### WANTED, a FLORIST'S MAN, for West

End Shop. Must be a good Buyer of Flowers and Plants, and understand Window Dressing, Plants, Making up.—Apply, stating age, experience, references, wages, to A., *Gardeners' Chronicle* Office, 41, Wellington Street, Strand, W.C.

### Nursery and Seed Trade.

**WANTED, as TRAVELLER**, a thoroughly efficient trustworthy, energetic, sober, and steady man.—Send particulars of experience, age, references, salary expected, to TRAVELLER, *Gardeners' Chronicle* Office, 41, Wellington Street, Strand, W.C.

**WANTED, a thoroughly efficient CLERK**, in a Nursery where Specialties in Seeds and Plants are a first consideration. Will have charge of Office, consequently must be a good Correspondent and Book-keeper. A good general knowledge of the Trade, and special ability for framing Catalogues indispensable. 10s. per week to a competent man.—H. V., 41, Wellington Street, Strand, W.C.

**WANTED, a SALESMAN**, for the Glass Department. It is essential that he be a first-rate Plant Grower.—Applicants to state experience and wages expected, to FISHER, SON, AND SIBBAY, Handsworth Nurseries, Sheffield.

**WANTED, a young MAN, as ASSISTANT**, in general Seed and Nursery Business, good at Weathers, &c.—Wages, references, &c., to LAXTON BROTHERS, Bedford.

### GARDENING APPOINTMENTS.

MR. B. CALVERT has been appointed Head Gardener to JOHN ARCHER HOUBLON, Esq., Great Hallingbury, Bishop's Stortford.

MR. G. CARPENTER has been appointed Head Gardener to Major COLLIS BROWNE, Broad Oaks, Blyfeet, Surrey.

MR. JAMES SHERLOCK, of Willersley Gardens, Derby, has been appointed Head Gardener to Captain E. WALKER, Rock House, Cromford, Derby.

MR. ANDREW SMITH has been appointed as Head Gardener to GEORGE CARMICHAEL, Esq., Taymount, Broughty Ferry, N.B.

MR. J. VOSS has been appointed as Head Gardener to W. SAVILL, Esq., The Finches, Lindfield, Sussex.

MR. WM. STANBURY, late Head Gardener to P. SAILLARD, Esq., Buchan Hill, Crawley, has been appointed as Head Gardener to T. D. GALPIN, Esq., Bristol House, Putney Heath.

### WANT PLACES.

Letters addressed "Poste Restante" to initials or to fictitious names are not forwarded, but are at once returned to the writers.

**NOTICE TO ADVERTISERS.**—In many instances Remittances in Payment of Repeat Advertisements are received without name, address, or anything behind the postmark on envelope by which to identify the sender: this in all cases causes a very great deal of trouble, and frequently the advertiser is compelled to prevent any person into whose hands it may fall from negotiating it. Advertisers are requested when Remitting to give their Names and Addresses, and also a Reference to the Advertisement which they wish repeated.

**POSTAL ORDERS.**—To Advertisers, Subscribers, and Others—it is very important in Remitting by Postal Order that it should be filled in payable to No. 42, DRURY LANE, to W. RICHARDS, as, unless the number of a Postal Order is known, and it has been made payable at a particular office, and to a particular person, the order is exposed to be sent into whose hands it may fall from negotiating it. N.B.—The best and safest means of Remitting is by POST-OFFICE ORDER.

### Gardeners, Foresters, Land Stewards.

R. B. LAIRD AND SONS can recommend with any very confidence Scotchmen thoroughly qualified as GARDENERS, FORESTERS, or LAND STEWARDS, either for large or small establishments, and will be pleased to furnish full particulars on application.—17, Frederick Street, Edinburgh.

## SCOTCH GARDENERS.

**SCOTCH GARDENERS.**—**JOHN DOWIE** (of the late firm of Downie & Laird, Seedsmen, 144, Princes Street, Edinburgh, has at present on his List a number of SCOTCH GARDENERS, waiting re-engagements. He will be pleased to supply full particulars to any Lady, Nobleman, or Gentleman requiring a trustworthy and competent Gardener.

**RICHARD SMITH AND CO.** beg to announce that they are constantly receiving applications from Gardeners, seeking situations, and that they will be able to supply any Lady or Gentleman with particulars, &c.—St. John's Nurseries, Worcester.

**Gardeners, Farm-Bailiffs, Foresters, &c.**  
**DICKSONS (Limited)** are always in a position to RECOMMEND MEN of the highest respectability, and thoroughly practical at their business. All particulars on application.  
Telegraphic and Postal Address "DICKSONS, CHESTER."

**To Noblemen and Gentlemen requiring Land Agents, STEWARDS, BAILIFFS, or GARDENERS.**  
**JAMES CARTER AND CO.** have at all times upon their Register reliable and competent MEN, several of whom are personally well known to Messrs. Carter. Enquiries should be made to 237 and 238, High Holborn, W.C.

**B. S. WILLIAMS** begs to intimate that he has at present in the Nursery and upon his Register some excellent Men, competent either to fill the situation of HEAD GARDENER, BAILIFF, FOREMAN, or JOURNEYMAN. Ladies and Gentlemen requiring any of the above will please send full particulars, when the best selections for the different capacities will be made.—Holloway, N.

**GARDENER (HEAD),** where two or more are kept.—Age 31, single at present; over three years' character from present situation as Foreman.—H. HALL, The Gardens, Lower Woodside, Hatfield, Herts.

**GARDENER (HEAD).**—Age 40, married eight years, no family; previously with Viscount Cranborne, &c., S. Merton, Eps., (thirteen years); Sir G. Pigott Bart., Exhibitor at London and Brighton. Son of T. Marshall, Head Gardener forty years to W. Peel Croughton, Esq.—G. MARSHALL, 39, Thrale Road, Streatham, S.W.

**GARDENER (HEAD);** age 35, married; twenty years' practical experience in good establishments in Early and Late Forcing of Fruits, Flowers, and Vines, the cultivation of sixteen and Greenhouse Plants, &c., also other Gardens and Pleasure Grounds.—J. FINLAYSON, The Gardens, Combe Bank, Sevenoaks.

**GARDENER (HEAD);** Age 34.—Mrs. ANDERSON, Waverley Abbey, Farnham, Surrey, wishes to recommend her late Head Gardener (who was with her for nearly seven years) to any Lady or Gentleman requiring a good practical Gardener. Twenty years' experience in large establishments.—E. E., Upper Shortess, Gravesend.

**GARDENER (HEAD WORKING).**—Married, three children; well-up in Gardening in all its branches. Abstainer. Good references.—F. BARRETT, Downham Market, Norfolk.

**GARDENER (HEAD WORKING).**—Married, three children (youngest age 9); thorough experience in Early and Late Forcing. &c. Highest references from present and former employers.—T. W., Monson Road, Redhill.

**ASSISTANT, in Seed Establishment.** Wholesale preferred.—Age 20; has had five years' experience in Shop, Warehouse, and Office Work. Can be well recommended by present employers.—A. M., Messrs. Fotheringham & Wallace, Dumfries.

**HOLLOWAY'S PILLS.**—Weary of Life.—Derangement of the Liver is one of the most efficient causes of dangerous diseases, and the most prolific source of those melancholy forebodings which are worse than death itself. A few doses of these pills act actually in dispelling low spirits, and repelling the covert attacks made on the nerves by excessive heat, impure atmosphere, over-indulgence, or exhausting excitement. The most shattered constitution may derive benefit from HOLLOWAY'S PILLS, which will regulate disordered action, brace the nerves, increase the energy of the intellectual faculties, and revive the failing memory. By attentively studying the instructions for taking these pills, and explicitly putting them in practice, the most expending will soon feel confident of a perfect recovery.

**MESSINGER & CO.'S New CATALOGUE of Greenhouses and Heating Apparatus,**

Just issued, will be found the most complete, practical, and reliable guide to all about to build, alter, or heat greenhouses. Illustrations of every description of Glasshouse, from the largest range of Winter Gardens to the simplest forms of Portable Greenhouses, Plant Protectors, and Garden Frames; also of all the best kind of Boilers, Hot-water Pipes, and all appliances for heating. This Catalogue, possessing hundreds of illustrations of all the latest improvements in greenhouse building and heating, is on a scale never before attempted. It should be in the hands of every one interested in gardening, as it contains many practical hints on the subjects of which it treats, the result of many years' experience. Price 2s. post-free.

A large number of the illustrations are taken from greenhouses erected by us in various parts of the country, an inspection of this Catalogue shows, therefore, buildings the efficiency of which has been well tested by actual use. The advantages possessed by us enable us to carry out work with the utmost promptness, and in the very best style, at prices which defy competition. Surveys made and gentlemen waited on in any part of the country. Plans and Estimates free on application.

## HELLEBORUS NIGER, OR CHRISTMAS ROSES.

I can offer a magnificent lot of Christmas Roses, probably the finest lot in the Trade, especially of the H. niger major variety, which is the great favourite among market growers. These now offered are home-grown clumps full of flower-buds, and will be ready to lift in October; and I would advise early orders to secure them, as the stock of fine clumps is very limited.

### MAXIMUS.

A robust variety, the largest of the group, and very ornamental as a foliage plant. It flowers in October and November, the blossoms are large and white, shaded with rose on the exterior, and generally produced in twos, but if shaded or a glass placed over the plants, the flowers are then pure white. By shading the flowers can be retarded even to December. It is the most vigorous of the section, and succeeds where many of the others fail to grow.

### MAJOR.

Although this plant is frequently offered, it is seldom to be obtained true to name, owing to its great value for cutting purposes. The flowers are pure white under glass, but have a slight rosy tinge in the open; it is the greatest favourite among market growers, producing flowers from December to January. It is a grand variety for potting, the foliage is so close and compact, and the flowers abundant.

### RUBRA.

One of the most distinct and novel of this group. The flowers are large, produced about the end of January, and of a lovely colour. It is a robust grower, free blooming, and a decided acquisition for cutting.

### RIVERSTON.

A fine distinct variety, somewhat in the way of H. maxima, but with smaller foliage, yet a strong robust variety. The flowers are produced in pairs, pure white, and blooming in the open at Christmas, a little earlier than major and later than maximus, thus forming a nice succession, and will be found a fine addition to our list of these useful winter-blooming plants.

### COLLECTED PLANTS.

These are far superior to the ordinary stuff generally offered, which are usually dried up and half dead before received, being collected by inexperienced men; those now offered are fine healthy plants, and usually are as fresh as when first lifted, and always do well.

Prices on application.

**THOMAS S. WARE,**  
HALE FARM NURSERIES,  
TOTTENHAM.

## CARTERS' CHEAP BULBS.

**WILLIAM ICETON** has a very extensive stock of all the leading kinds, in fine condition; 20 houses being devoted to their growth, many being fit for exhibition of the following varieties:—*Areca lutes*, *Cocco flexuosa* and *Weddelliana*, *Kentias* of all kinds; *Seaforthia elegans*, *Latania borbonica*, *Phoenix reclinata*, *rupicola*; also a very large assortment of Palms in 60's and 48's for table. Inspection invited.—Putney Park Lane, S.W.; and 129 and 130, Flower Market, Covent Garden, W.C.

# S A N D E R & C O .

## STARTLING NEW

# CYPRIPEDIUM.

PARTICULARS IN FUTURE ADVERTISEMENTS.

# New First Early Dessert Apple.

## COOLINGS' "BEAUTY OF BATH."

First-class Certificate Royal Horticultural Society.

The "BEAUTY OF BATH" is fit for use at the end of July and early part of August. It immediately follows the Juneating, and is earlier than the Irish Peach, from which it is quite distinct. The fruit is of medium size, round and flattened, the ground colour a yellowish green, beautifully striped and spotted with crimson toward the sun; the flesh is firm and pale yellow, and it has a brisk, sub-acid flavour far superior to that of other Early Apples. It is a certain and free cropper. Our stock trees have not failed once during the last six years, and it will, on this account, be a valuable market variety.

It was awarded a First-class Certificate by the Royal Horticultural Society, August 9, 1887, and the following are some of the extracts from the Gardening Periodicals of that week:—

*The Gardeners' Chronicle*, August 13, 1887.—"A handsome seedling Apple, with the look of Cox's Orange Pippin, came from Messrs. George Cooling & Sons, Bath. It was named Beauty of Bath, and received the unwonted honour for an Apple—a First-class Certificate."

*Journal of Horticulture*, August 11, 1887.—"A First-class Certificate was awarded to Apple, Coolings' Beauty of Bath, a pretty Apple of medium size, 2½ in. across, 1½ in. deep, eye closed in a deep basin, stalk short, thick, in a deep depression, colour bright red with numerous whitish dots. Flesh firm, yellowish, of a brisk sub-acid flavour, rather suggestive of the Devonshire Quarrenden."

*The Gardeners' Magazine*, August 13, 1887.—"Apple, Coolings' Beauty of Bath.—"An early dessert variety, remarkable alike for its handsome appearance and high quality. The fruits are of medium size, roundish, slightly oblate, and of a rich reddish-crimson colour on the sunny side, dappled with green; flesh yellow, firm, brisk, and richly flavoured."

In an Article on Early Dessert Apples, in "The Garden," of September 3, 1887, Mr. W. COLEMAN writes as follows:—

Apple, Beauty of Bath.—"It was not until last year that its great merits were made known to the general public. The fruits, of medium size, are round and flattened, not unlike those of the Irish Peach, from which it is quite distinct; ground colour yellow, richly striped and suffused with crimson when fully ripe. Having many times had the pleasure of awarding 1st prizes to this delicious variety, I can strongly recommend it to all lovers of first-class Early Dessert Apples. The stock is in the hands of Messrs. Cooling & Sons, Bath."

Mr. S. FORD, Leonardslee, Horsham, in "The Garden," of August 18, 1888, writes:—

"Beauty of Bath, sent out by Messrs. Cooling & Sons, will prove one of our best Early Dessert Apples when better known; it is extremely handsome, has a brisk and agreeable flavour, and should receive early notice by all."

ROYAL HORTICULTURAL  
SOCIETY.  
CHISWICK FRUIT EXHIBITION AND  
CONFERENCE.

(Continued from page 454.)

FRUIT PRODUCTION AND DISTRIBUTION  
FROM A PROVINCIAL POINT  
OF VIEW.

By Mr. E. J. BAILLIE.

I FEEL some explanation is needful for the introduction of a paper which does not profess to be technical before such an audience, and upon such an occasion; but I have long held the belief that, whilst we pay strict attention to the practical points, or strictly technical details which rightly claim the closer attention of the specialist, we ought to give some prominence to particulars which, we may say, constitute the fringe of a subject.

Whilst these are, perhaps, of a too general character to possess much charm for the person intent upon some particular detail, they serve to put us in touch with the public, and thus are helpful in removing popular prejudices, for there is a sense of separation somehow between those to whom we look for fruit consumption and those to whom we look for fruit production.

I knew, too, that there would be gentlemen of wide practical experience whose names are in the front rank of the honourable record of present-day horticulture, taking active part in these proceedings, and I thought that they would treat of particular phases of the subjects irresistibly suggested by a "National Fruit Conference."

In this I was perfectly right. Whether I was right in my choice of a subject, for the reasons already stated, remains to be seen, but I venture to think, from what I know of the good nature of those connected with garden pursuits, I can claim your indulgence if I fail

to gain your approval; and if any remarks of mine are such as to provoke hostility of thought, you must please put them down to provincial prejudice, or, may I say, to that simplicity which is one of the most prominent attributes of raw rusticity.

I appreciate the difficulty of saying anything new on the question, but I shield myself behind the fact that the reiteration of a truth is not a needless undertaking until precept is put into practice. So long as we pay our millions of money into other hands for produce which could come from ourselves we are quite safe in assuming that there is yet reason for action.

Coming up from pastoral pursuits to this great centre of crowding, clamouring life, how can one express the feelings that somehow naturally force themselves to the front? They may be said to be somewhat thus: Here you have in your great crowded centre somewhere approaching 5,000,000 of souls. This area, with its vast population, has practically grown nothing but bricks and mortar save the trees and flowers in its beautiful pleasure parks and its promenades; and if this great centre were dependent upon its own resources for market produce for its daily needs it would very quickly have to answer its children's cry for bread by giving them stones.

This great multitude must take some feeding. The open country of the shires gives garden ground enough for all. The earnings of the provinces find their way largely into the pockets of the land-owners, and they, in the natural order of present day methods, spend a large portion of their time and the greater part of their wealth in London. There is a kind of feeling that, seeing so much of the wealth of the country comes here, more might be done for us and less for the foreign coquettes who court your favour and gain your sympathy and support for such things as we can grow quite satisfactorily at home.

I do not at all fear the bogey of foreign competition. This is, I remind myself, a National Conference, but the subject is really universal. The idea involved in fruit production and distribution is too large for a nation. We cannot, for instance, grow the Orange. We should not like to dispense with it, therefore we invite the foreigner to send it to us; but we can produce Pippins; then why should you raise your eyes above the beautiful fertile plains, say, of Kent and Sussex, and with the telescope of a false economy find beyond the seas, in the broad acres of America, Canada, Australia, and elsewhere, the admitted beauty of fruitful plains, but also an added imaginary beauty, really nothing beyond what you could have seen without the glasses within the confining hedgerows of our British orchards?

We must, however, get somewhat nearer the chief points to be considered. We must drop figure, and get to facts. We think we may safely start with an aphorism. Cultivation of the land is the basis of all economy. Mother Earth, after all, nurtures the whole family of the human race. "The profit of the earth is for all; the king himself is served by the field." The political economist and the social scientist can touch no profounder problem than that of production, and we cannot escape the consideration of the threefold aspect of the laws of life which all rightly civilised people recognise:—

1. The population must be properly employed.
2. The people must be clothed and fed.
3. As a necessary condition the land must be cultivated and cropped.

Now, we have already reminded ourselves that we have to take ourselves outside the limit-line of streets and alleys, and get into the open country, where we find agriculture and horticulture side by side, sometimes overlapping each other, but always mainly concerned with these four phases of occupation:—

1. Cattle production, under which I would include the rearing and breeding of all animals for slaughter or other purposes.

2. Wheat production, under which head I would include all arable farming.

3. Dairy farming, under which I would include all milk, cheese, and dairy products.

4. Fruit farming, including the production of vegetables and other market produce of this character.

The consideration of the question of supply immediately brings before us the question of demand. We ask ourselves—What is demand? Why is it useful to produce? An elementary question truly, but one which has been handled peculiarly by the jugglers of political and other economists. Briefly, produce is needed for the maintenance of political life. It was easy for the French wit to say, "Give me the luxuries of life, let who will take its necessities;" but necessities are—necessities! We then ask ourselves upon what can good health and happy life be best maintained.

#### FOOD REQUISITES.

Well, I fear we should here quickly get into conflict of opinion. Doctors differ. I am justified, however, upon the grounds of science and of personal experience in asserting that men can live, and live healthfully and happily, on cereals and fruit, so that a wheat farm and a fruit farm would meet all national needs. I know I strike a chord which may not be one entirely of harmony in a meeting of this character, when I say that man can derive all needful sustenance from the cereals and fruit, that is to say, humanity has in fruits—for cereals are fruits—all that it needs. Mark, please, I do not say it has therein all that it craves, but all that it needs. Now, if in any other machine than that of man (if you permit him to be so considered for a moment), heat, essential for its going, could be got from deal logs, and it was being fed by the engineer with mahogany, French polished, and refined oils, we should consider it strange. Of course he might do it if he liked; but we should wonder why. Man, so far as his means permit, may, too, feed on what he likes, but the economist must first consider essentials, not preferences or prejudices. But I find I must push forward, for I dare not pursue fancy too far in a paper of twenty minutes length.

#### THE LABOUR QUESTION.

After the determination of what is essential for the maintenance of life we must consider the labour question. Which of the four systems under which we have divided the question of cultivation employs the largest amount of labour, and in which are our labourers the most happily and healthily engaged? Unhesitatingly, with firmest decision, we answer, in fruit production. Quite lately I, by chance, became the travelling companion of one of the largest agriculturists in our county, whose farm lands had been laid down to grass. He had given up corn for cattle, and he told me that as a result fifteen cottages were at that moment standing empty so far as farm labourers are concerned. He had no further use for them, and they had gone—where? He did not know, but in all probability to swell the already congested population of the towns. How are we to get our open-faced, honest-hearted country population back to the green lanes and the gardens?

One of the best methods is by the development of the industry of fruit production. But is our climate such as to encourage safely the cultivation of hardy fruits? Let us not commit the often rash errors of a too eager enthusiasm. I do not know which most to pity or blame—the blind optimist who to every question suggesting the possibility of big profits, Arcadian delights, and a contented population always basking in the sunshine of ease and unconcern, replies, "I answer enthusiastically—Yes;" or the poor pessimist who says our Apples are only Crabs; but there is a worm at every core; that the glory has departed, and we are all tumbling into the Slough of Despond.

But there is a *via media*. It is possible to make the crooked straight, and the rough places plain, if we only set ourselves heartily to find the more excellent way.

Hardy fruits can be grown, and well grown, in this much despised climate of ours; but, like every thing else, it must be done properly. No more subtle sweetness, crispness, and altogether right flavour can lurk beneath the skin of Apple or Pear than can be found in the flesh of a British-grown Cox's Orange, or Ribston Pippin, or some of our best Pears; and no sprightly sauciness of brisk acidity can be found in the often insipid flavour of many of the foreign sub-acid Apples to compare with that of a Northern grown Keswick or Lord Suffield.

#### CONSEQUENT THE TASTE OF THE PEOPLE.

There are those about us, and apparently warmly interested in this movement, who go to extremes in both directions. In this problem of production let us remember we have all tastes to suit, all palates to please, and therefore a wide range for our catering. One cannot help being amused to read of somebody's Pippin that it is the Apple of the future for its sweetness and syrupy juiciness, to which sugar would be a superfluity if not an absolute detraction; and in another week's issue of the same journal to be told that the merit of somebody else's seedling, which is to be the Apple of the future, is found in and founded on the fact that its beautiful tartness of flavour is such as absolutely to defy the seductive influence of sugar or syrup, bringing it to the dull level of the popular palate which can only take its Strawberries when reduced to a kind of saccharine paste—which can only take Currants as preserves, or Cherries in brandy.

So long as opinions differ so widely we need not fear the unavoidable influence of climate in any of the home districts upon the qualities of our British-grown fruits.

Whilst admitting a certain amount of healthy variation in the quality of the fruits I would venture to say that the error of the past has been rather in the multiplication of kinds than in the other direction. Some people have prided themselves upon having as many varieties as they can count trees in their orchards, but I could never see the full force of the benefit of such possession. It is well to choose but few kinds letting them be such as are suitable to the district and such as commend themselves as market favourites.

For instance, in the larger Lancashire towns Apples of a brisk sharp flavour find much readier sale than the sweeter fruits for which there may probably be greater demand in the South. If you can sell at Cottonopolis Keswicks or Lord Suffields by the ton why not grow them by the acre rather than coddle with somebody's new seedling said to surpass the Newtown Pippin in its sugary flavour when the season is favourable enough for it to fruit? Meet the demand of the district and proceed cautiously; extend as rapidly as you like, but carefully.

If it is worth doing at all it is worth doing well. Do away with worthless incumbrances of the ground. A good fruit is as readily grown as a bad one. This is the *crux* in the provinces.

#### OUR ORCHARDS.

If time permitted me to draw you a picture of the typical farmer's orchard you would not wonder that fruit growing was a feeble industry in many places. Such so-called orchards are, many of them, excellent hunting-grounds for the entomologist or the cryptogamic botanist whose special attraction is amongst mosses and lichens. Most of the trees are favourable specimens of artistic antiquity. The only evidence of anything approaching a pruning process which I have ever witnessed amongst some of them was the wreckage of the storm or the broken boughs at Appledee which had snapped asunder under the weight of the ladder against them.

If the orchards are carelessly kept—or carelessly unkept—it is an equally peculiar fact that when fruit is borne by the trees it seems to suggest no necessity, for right handling. Mark Twain in one of his sketches enlarges, I think, upon his experience in days when he was assumed to have the editorial charge of an agricultural paper, and in reply to a correspondent, he told him he thought he had him-

self to blame for the condition of his Turnip crop, the defects of which he had just described. "You should wait," said Mark, "until they are nearly ripe, then get up the tree and shake them down. He found that was not the way Turnips were treated, but the editor had probably seen a country farmer gathering his fruit, for that is precisely the method he follows on such an occasion. All this and much more must be changed before British fruit-growing takes the important place to which it is entitled.

#### FRUIT AS FOOD.

The present position of the fruit question in the public mind seems to be that fruit is now used to grace the tables of the wealthy or to add a kind of fashionable finish to the dinner of the fairly well-to-do; but it is seldom regarded as food pure and simple, though such it really ought to be.

Let anyone having an interest in philanthropic work make enquiries amongst the poor of the large cities, and he will find that fruit is almost, if not entirely, absent from the list of dietary articles from which the food supply of those who live in the narrow streets and the crowded alleys is derived. I have gathered statistics in our own district, and was startled to find how the poor live even in a provincial town where a person placed at its centre might get between the hedgerows and into the fields well within half-an-hour. Ignorance and prejudice have helped to maintain this condition of things, for they have only the bare idea that fruit is palatable and have no idea that it is also invigorating and healthful.

For the proper and complete development of the fruit movement in this country we must have all our forces to the front. There is a really steady demand, we are told, for the best fruits carefully gathered and well packed at most remunerative prices. That seems to meet the want in certain directions, but we must encourage those educational and moral movements, which have for their aim and object the inculcation of habits of thrift and health amongst the masses of the people.

There should be, and there must be, a very largely increased demand for the home product, and the home product will be then forthcoming; and this brings us closer to some of the features we have to face in the question of distribution.

#### DISTRIBUTION.

This opens up as many avenues of thought as the question of production—perhaps more, for in the question of production we deal largely with matters of conjecture, for we can never know the end of an unfulfilled course, and if you advocate two methods or fifty you would find followers for each; but the question of distribution brings us at once face to face with problems of £ s. d., and with the conditions of market operations and regulations.

I do not intend to take up the time of this meeting by attempting to deal with one of the most damaging conditions which we meet with in the very outset, that, namely, of the railway rates. Nor do I attempt to touch upon that other forcible deterrent—the question of land tenure; both these will be dealt with in separate papers; but until some sweeping change is made in the present system of railway charges the British fruit grower will find his industry shackled and weighted to such an extent as to prevent his making a profit at all commensurate with that which he is helping to put into the pockets of the railway shareholders.

#### KNOWLEDGE NEEDED.

Next to the railway question we require the establishment of some responsible agency to take up, in combination, the conditions which cannot be successfully fought singlehanded, and this agency should not be merely commercially protective, but also educational. Amongst other matters it should collect and publish careful data as to districts, climatic influences, meteorological notes, and such other intelligence as would serve to guide. This body would have to be influential and potent, for the power of monopoly is, as matters now stand, almost invariably against the producer and the consumer, and in favour of some intermediate agent, and whose presence may be neces-

sary for the discharge of commercial enterprise, but who ought to be regarded more in the capacity of a carrier or an agent rather than a trader or merchant.

#### MARKETS.

Next we require the provision of centres of sale. Endless time is lost by the producer in his effort to find a market, and neglect at home is consequently unavoidable. It is essential that persons having produce to sell should be brought into contact with persons requiring to purchase, but we have at present no such facility. Cheshire has its cheese fairs, established by the order of a Council, and the staple product of the county therefore holds its own in spite of foreign competition. Birmingham has its Onion fair, but I do not know of a town in England that has its fruit fair.

#### PURCHASE BY NAME AND BY SAMPLE.

Then we ought to be able to purchase fruits by name as to variety. To the farmer mind not so many years ago everything green upon the face of the field was grass. To the mind of the average citizen or citizen's wife anything that is round, and that has been plucked from a tree in an orchard, is an Apple; it matters not whether it be a Crab or a Golden Pippin—it is an Apple; but we want to initiate the public into a knowledge that certain Apples carry with them certain qualities and certain flavours, and we want then to show that precisely what they want can be supplied. There are advertisements in connection with domestic commodities, which seem to suggest the grave importance of your being sure you get somebody's starch when you ask for it. The same caution should be applied in the pomological department, and when the cook finds out that a certain kind of Apple can be depended upon for a certain quality we should find the beginning, too, of a more definite order of things.

Another great impetus to the home product might be insured if at railway stations and other places where the public gather themselves in masses English fruit could be obtainable instead of the everlasting French Pears and American Apples. And I should like, if those ugly iron impediments called "automatic deliveries," or some such wonderful name are to be tolerated, that they should, in response to the penny and the push, give orchard Plums instead of sugar plums, and Apples and Pears in preference to chocolate or candy.

Another idea that has long possessed me is the idea of the selling of fruits from sample. According to present methods of distribution a producer gathers his fruit and carries it away to the markets, there to stand with a load of it until it is distributed. Those who have learned the art of modern marketing have found out that prices decline as the day wears on, for the grower does not desire to cart the piece of a load home again. On the other hand, there may be a system of "topping"—I may be excused if I explain (for of this my present audience is doubtless ignorant) that this implies a process, possibly accidental, by which the larger, better fruits in a basket gravitate towards the top! This is, of course, open to the suggestion of unfairness on the other side, but if the grower submitted samples of his fruit just in the way the farmer does who has grain or seeds to sell, an immediate relief would result.

A farmer does not think of carting the yield of his grain fields to the open markets, but asks the merchant to buy upon the sample placed before him in the market; and he can sell or hold as he then thinks best. He would then be in a less likely position for the imposition of injustice.

#### THE DUTY OF SOCIETIES AND OF THE PRESS.

Then I think in the interests of distribution our leading agricultural and horticultural societies—agricultural societies especially—should recognise the industry, and admit home fruit products into their schedules of subjects for competition. I am glad to observe that the Royal Agricultural Society of England has taken up the matter, and hope other

agricultural societies may now be induced to follow. It is likely that more good will arise from sources of this character than through minor efforts of less prominent bodies as the subject would then be considered along with the problems of land cultivation in their more important and varied aspects.

I must not forget to include the all-powerful Press. We have natural friends in the editors of horticultural publications, but I am glad to see the general Press of the country is now taking an interest in the question. Whilst many newspaper readers are evidently competent to take an intelligent view of the matter, there are some who seem to discern in the agitation something like the sectarian movement of a new faith for which they have quickly set themselves to invent the name of the "Faddist." Well, let it be so. If we are to get public attention called to the question, we may hope that the long delayed interest will be fairly and fully aroused, and whilst we rejoice in the peace and prosperity of a nation preferring pruning-hooks and ploughshares to swords and spears we shall yet the more rejoice when we gain the greater victory and proclaim the wider conquest of the sickle and the spade.

#### ENEMIES OF THE APPLE AND PEAR.

By MR. J. FRASER.

[We insert woodcuts of the "Enemies" alluded to by Mr. Fraser, and our past volumes abound with similar illustrations.]

BOTH animal and vegetable enemies are numerous, but the former probably outnumber the latter considerably. They range from the minute gall mites, about one-hundredth of an inch in length, up to birds, hares, rabbits, and cattle. Vegetable enemies are, however, none the less destructive sometimes, and certain kinds are very difficult or impossible to exterminate on account of their microscopic smallness, and more especially when hypodermal, that is, living beneath the epidermis of the host plant.

#### CANKER.

All diseases are attributable to some cause or other, although it is difficult to detect what that may be. Science may yet determine the true cause of canker, even if it fail to suggest a cure. That canker is something of the nature of a parasite, we have evidence in its spreading and attacking previously uninjured tissue (see fig. 59). Decay itself is brought about by the action of living organisms, on matter that is already dead, and effects the changes that crumble organic substances into dust. There is some truth in the statements that cold and undrained soil, severe pruning, extreme variations of temperature, late growth, and unripened wood, give rise to canker, just as bad treatment will undermine the constitution of a human being and prepare the way for disease. The real enemy does but take advantage of the weakened state of the victim. Some varieties of Apples and Pears are more prone to canker than others, and especially in some soils that may be cold, undrained, or are underlain by a gravelly sub-soil. Here, again, we may point to the natural constitution of the trees in question. Great improvements have been effected by drainage, by ameliorating or supporting fresh soil, all of which point to the fact that more or better nourishment is needed to enable the trees to make healthy growth in order to contend with an invisible but powerful foe. The baneful effects of canker may to a great extent be evaded by planting in good, well-drained soil, and by superior cultivation. It is not sufficient that the right materials are present in a soil, but they must also be in a soluble condition, so that the roots may be able to appropriate them. Good tilth promotes early vegetation, an early maturation of the wood, and by imparting a greater constitutional vigour to the tree enables it the better to ward off disease even when accidentally or otherwise injured. With this preliminary I proceed to classify the other enemies.

#### ANIMALS.

Numerous as these are they may be roughly divided into a few groups, such as insects, birds, and other animals. Kaltenbach, a German entomologist,

says that 183 species of insects prey upon the Apple, of which 115 are lepidoptera, thirty-two beetles, twenty aphides, and sixteen others belonging to different families. Of these I can only mention a few of the more important or destructive in the limited time at my disposal, with the view of directing attention to the fact that their successful destruction can only be effected by proceeding against them by intelligent and scientific methods. Haphazard raids are mostly useless, and attended by failure, while passive and indolent indifference is but too plainly evident in many a neglected old garden or orchard. Scientific research is frequently sneered at by the practical man, but until the habits and life histories of some particular foes are thoroughly investigated there can be no intelligent, sensible, or effectual attack made upon them.

The Apple grub (*Carpocapsa pomonana*)—(see fig. 61), is the larva of a small moth which lays its eggs in the calyx of the young and growing Apple in the month of June or July according to the season. The larva when hatched is white with a black head and neck and four rows of black spots. It gnaws its way down the fruit, keeping clear of the core till it reaches

latter. When plentiful it proves very destructive, causing swellings of the external tissues resembling cancerous wounds. The insects take up their abode in the crevices of the bark, from which they are difficult to eradicate. Soft soap, Gishurst compound, or, better still, petroleum, will effect a cure if rubbed into the crevices of the bark every time the insects make their appearance during the course of the season. Petroleum is the most effectual, and should be applied by means of a hard brush, such as is used by painters. The insect hibernates in the soil during winter if the trunk of the tree does not afford sufficient accommodation, and it may be destroyed by the application of quicklime a little beneath the surface. The Apple Blossom Weevil (*Anthonomus pomorum*—fig. 62), is a beetle, the female of which lays her eggs in the bloom-buds of both Apple and Pear trees, and the grub, when hatched, eats the stamens and pistils, rendering

a similar way to that of the American blight. The eggs are never laid, but hatched in the body of the mother when she dies. The latter is wingless, while the male is minute and winged. If the scale is numerous the tree becomes unhealthy and unfruitful. The scale is brown, and in shape like the half of a mussel shell. Scrub the branches with a hard brush just kept moist with petroleum, and persevere for two, three, or more seasons, as the scale is most difficult to eradicate when once it obtains a footing.

Gall mites (*Phytoptus Pyri*) are small acari about the one-hundredth long by one five-hundredth of an inch broad, that produce blisters on Pear leaves. The tissues of the leaves are torn asunder, forming large cavities, the cells often forming strings holding on by their ends. There is a small opening on the under surface for the egress or ingress of the mites. My specimens of blistered leaves are from Kelso, the first record to my knowledge of gall mites in Scotland. I received them in August last. The mites hibernate in the buds of the tree in

FIG. 59.—CANKER IN APPLES, SHOWING THE PRESENCE OF A FUNGUS, *NECTRIA DITISSIMA*.

FIG. 60.—THE APPLE GRUB AND MOTH.

the rind, which is pierced to permit the escape of its excreta. When nearly full grown it sometimes pierces the core and feeds upon the pips, generally causing a great number of the fruits to fall prematurely. Soon after this it leaves the fruit, and finding a secure retreat in crevices of the bark or other hiding-place commences to spin itself a cocoon, and after resting a time becomes transformed into the chrysalis state, which it retains till spring. Soon after completing their development, the moths pair, and egg-laying commences as formerly.

The grubs may be trapped in great numbers by tying bands of hay or straw round the trunks of the trees so as to afford the grubs a place of shelter in which to form their cocoon. Collect the bands in autumn and burn them. All fallen Apples should be assiduously collected and given to pigs or destroyed. The Codlin grub trap is a special structure, consisting of several boards of a convenient length fastened together in the middle, and the respective pieces kept apart by means of thin laths. The grubs readily take to this, and from 400 to 800 traps can be examined by a man per day and the grubs collected in a vessel.

The American blight is the work of *Schizoneura lanigera* (fig. 61), an insect closely allied to the aphid or greenfly of gardens, but differing in the absence of the "honey-dew" secreting glands possessed by the

them completely useless. Egg-laying lasts for two or three weeks, during which time great numbers of the weevil may be caught by shaking the tree, beneath which a white cloth has been spread, as they drop down on being alarmed. The weevil attains perfect development in a month's time from the laying of the egg, and feeds on the foliage during the rest of summer. It hibernates in the same way as the American blight, and similar methods for its destruction may be employed. Bands of tarred cloth may also be put round the trunk of the trees affected to intercept and catch the females on their way from the ground to the tree, as they seldom fly. Good husbandry also applies here; rubbish of all kinds should be rigidly cleared away, and crowding of trees prevented.

The Apple Mussel Scale (*Aspidiotus conchiformis*—fig. 63), is allied to the true scale, and attacks the bark of Apple and Pear trees alike, affecting them in

FIG. 61.—INSECTS CAUSING AMERICAN BLIGHT.

FIG. 62.—THE APPLE WEEVIL.

winter, and are most difficult of extermination. Collect all affected leaves in spring when the mites are still in them and burn them. When once badly affected the trees continue so from year to year, and unless they are valuable kinds should be grubbed up and burnt to prevent the pest from spreading. Plant healthy trees in their place. I had specimens from another source affected with gall mites, mussel scale, apparently canker as well.

Slug worms (fig. 65), are the grubs of certain sawflies differing in colour, and in the nature of the secretion covering their bodies; but the slugworm proper is the grub of *Eriocampa limacina* (or the *Selandria Cerasi* of Miss Ormerod). It derives its name from the black slime covering its hairy body till the last moult, when the resinous dark coat is thrown off. The grubs have large heads, and in the earlier stages when slimy bear considerable resemblance to a black slug; hence the derivation of the name slugworm. I collected my specimens on Pear trees at Holwood, Kent, the other week. Autumn is the time they make their appearance. They are very voracious, and eat away the upper surface of the leaves

which become brown and ultimately drop, causing the trees to become unhealthy. The fruit was affected with the fungus which causes cracking, were very much split, and entirely useless. The slugworms under notice attack most of the fruit trees belonging to the natural order Rosaceæ. They may be destroyed with Hellebore powder mixed with water, and applied through the rose of a watering-pot. As they hibernate in the first 3 or 4 inches of soil, that depth should be taken off and burnt. Both grubs and flies are extremely sluggish, and the latter may be shaken down on a white cloth and removed.

#### BIRDS.

The feathered enemies are more easy to deal with than any of the above; but, with the exception of the bullfinch and the sparrow, I would not advise the shooting of them. Even the latter has much to recommend him to mercy. If the birds are killed wholesale we destroy the balance of Nature, and get afflicted with a plague of insects far more difficult or impossible to exterminate. The gun should be employed during the ripening of the fruit to scare, not to kill. The warning cry has been heard from many an orchard in Kent during the past summer. Of the larger animals, rabbits and hares are the most destructive during severe weather. They soon destroy an orchard by barking the young trees. To prevent injury, protect the stems of the trees with branches of Blackthorn or Furze; but the

spot in the centre, surrounded by a white line, and that again by a black border. The Pear is attacked in the same way by a variety of *Cladosporium dendriticum*, generally known amongst fungologists under the name of *Fusicladium prunum*. No remedy is known, and means to prevent its spreading must be adopted by destroying badly affected trees and fruits. Here, again, good cultivation greatly

FIG. 63.—APPLE MISTLE-CANE.

tends to palliate the evil by encouraging a healthy, vigorous growth of the trees. Marie Louise and Louise Bonne of Jersey Pears are very subject to it, and should not be planted in places infested with the disease.

destructive on the Continent. Hand-picking the leaves as the spots make their appearance, and before the spores are shed, is the only remedy, and no Juniper bushes should be allowed to grow near them. On a large scale it is more profitable to uproot badly-affected specimens, and plant afresh.

Mistletoe in this country is the only chlorophyll bearing parasite that need be noticed. It is very injurious to orchards in Herefordshire from its great prevalence, and prevents the branches infested by it from thickening properly below the union of the parasite with them, ultimately causing the trees to become stunted and unproductive. Cut down the Mistletoe about Christmas, when a market will be found for it to defray the expenses of the operation.

Epiphytes, such as lichens and mosses, can be removed by scraping or scrubbing the bark of the trees, or they may be destroyed by sulphuric acid much diluted in water. The evil is but half remedied, however, and the lichens will soon grow again unless measures are taken to remove the cause by draining or otherwise ameliorating the land, as the case may require, and so induce a healthy, vigorous growth, thereby enabling the trees to thrive, increase in thickness, and throw off the old bark.

#### THURSDAY'S DISCUSSION.

MR. TONKS' PAPER. (See ante, p. 440.)

MR. COLEMAN asked if lime was used in a caustic state?

MR. TONKS replied that it was generally used as gypsum, but all lime would answer the same purpose. MR. ROYCE said he had used lime freely in com-

FIG. 66.—MILDEW ON APPLES.

most sure and effective plan is to use a guard of wire netting. Tar, grease and oils, should not be employed, as they are injurious by stopping up the air passages in the bark.

#### VEGETABLE ENEMIES.

These are of two kinds, namely, parasites and epiphytes. The former are the most to be dreaded, since they attack and destroy the living tissues of the host plants by feeding on their substance. Parasites may again be divided into those of a fungoid nature and those that are green.

Mildew (fig. 66) affecting the Apple is a white mould belonging to the family Erysiphaceæ, and in this, the early stage, it is referred to the genus *Oidium*. It is one of the most easily destroyed of parasitic fungi, from the fact that it lives on the surface and does not penetrate its host. Sulphur alone, or various preparations containing sulphur, will completely destroy the fungus. Should a large number of trees in a garden or orchard become affected, the application of sulphur would be a tedious and costly operation; but if a few isolated trees only are attacked the remedy is more easily applicable.

Cracking is caused by *Cladosporium dendriticum* (fig. 67), a too widely prevalent fungus, that grows on the leaves, young shoots, and flowers of the Apple, often preventing the formation of fruit. In severe cases the latter becomes partially or completely covered with blotches, crippling and preventing it from attaining full size, and in all cases the fungus reduces the market value of the produce by disfiguring or causing it to crack. The disease commences as black spots, branching from the centre like a small tree, while on fruit the patches soon become irregularly rounded, with a depressed black

FIG. 64.—PEAR MISTLE-CANE.

Rust on the Pear is caused by *Ræstelia cancellata*, as well as some other parasitic fungi. The *Ræstelia* produces rugged swellings on the leaves, the blotches finally becoming red, and showing themselves on both surfaces of the leaves attacked. It is believed

FIG. 65.—SLUG-WORM OR SAWFLY.

to be an early stage of *Gymnosporangium Sabinae*, which completes its life cycle on *Juniperus Sabina*. As in the rust of Wheat, there is an alternation of generations on different host plants, and described as heteroecism. It is not common in England; is not, I believe, recorded from Scotland; but is very

bination with soot, which he had found gave red Apples a more intense hue, and a darker colour to green Apples, generally improving and benefiting the trees. Did Mr. Tonks positively deny the possibility of canker being introduced to the healthy tree through a wound of any kind, or did he hold the opinion that a healthy tree, being strong, resisted the disease? From his own knowledge of surgery he was aware of the great analogy between the animal and the vegetable world. They all knew that a wound exposed to the atmosphere was liable to be affected by various germs floating about, and one great aim was to prevent the atmosphere having access to the wound. Wounds inflicted upon the bark of trees by any cause were likely to produce canker, but it made little progress in healthy trees, while trees unhealthy, through inferior soil or insufficient nourishment, succumbed to it.

MR. TONKS considered that his paper replied to the matters put forward. He did not believe that canker was in any way due to germs of any sort or description; nor did he believe that any external injury caused canker. Of course disease might develop in the injured parts.

MR. CLARK asked how it was canker attacked one sort and not another, when there was only a roadway between the trees?

MR. TONKS replied, because food of one variety was quite different from the food required by another variety. Many years ago he had a Citron des Carnes in his garden, which, after growing fruit for a number of years, he began to notice signs of canker in it. One day he grafted on it a Pitmaston Duchesse. The Citron des Carnes became a miserable object, but the Pitmaston Duchesse thrived thoroughly; showing that roots which would not

FIG. 67.—CLADOSPORIUM ON APPLE.

maintain the Citron des Carnes in health, were perfectly able to support in the utmost luxuriance the Pittman Duchess.

Mr. CLARK said some forty-five years ago he broke up 15 acres of meadow land, trenched it, and planted among others 250 each of Cellini Pippins, Wellingtons, and Early Juliette. The Wellingtons grew well; the Cellini cankered after it had been bearing three or four years. He cut off the heads of them all and worked them with Mank's Codlin which began to grow, and canker disappeared even from the stems.

Mr. TONKS said that was simply bearing out what he had said.

Mr. Geo. BUNYARD said that the frosts of winter and spring had a great deal to do with canker.

Mr. JOSEPH CHEAL said he had been endeavouring to get a healthy stock of Ribston Pippin. He had managed it by selecting very healthy trees, and had thus almost eradicated disease.

Mr. SHIRLEY HIBBERD mentioned that a friend of his, who, although he planted too many varieties for a commercial purpose, had done his work well. The ground was what was known as cold bottom fully exposed to the spring frost. The trees cankered very early, and his friend, who was a scientific man, came to the conclusion that canker came owing to small particles of ice getting in the forks of the trees. His friend did not cure the disease. He sold the trees, planted Ash trees, and sold walking sticks.

Mr. JOHN FRASER said, if feeding would not cure diseases it would assist the trees to grow and to throw off disease.

Mr. TONKS, in reply, said that bacteria might be at the bottom of many diseases, but authorities on diseases were by no means agreed. Individual experiments on the subject were extremely unreliable. It was impossible for him to answer without consideration all that had been put forward, but if this remedy did not cure canker, it would do no harm, and it would be worth while to try it.

#### MR. FRASER'S PAPER. (SEE P. 469.)

Mr. ROUPELL said Mr. Fraser did not mention the social caterpillar—one of the greatest plagues in his part of the country. An immense quantity of those insects got into his bush trees, and for three days he and others were engaged in picking them off. His neighbours who did not take that precaution, lost their foliage and fruit. These creatures could only be dealt with by hand-picking. He had a strong opinion that Potatoes were enemies to Apple trees, as they produced fungoid growths.

Mr. CLARK asked for information regarding the Gooseberry caterpillar, as he had seen whole gardens of Gooseberries cleared of leaves. The remedy was to get up early in the morning, when the dew was on the trees, to get a quantity of soot with a proportion of lime, and dash the mixture both under and over the leaves. He was satisfied that it would prevent the grub living.

A gentleman asked whether petroleum had any ill effects on the trees?

Mr. FRASER said petroleum did no harm, provided a moist brush only were used. Hellebore powder was also a good thing for caterpillars.

The CHAIRMAN proposed a vote of thanks to the readers of papers, and in so doing said the day had been a heavy one, but a vast amount of most valuable information had been placed before the Conference. He would like to say that an excellent remedy for American blight was hot brine, which should be rubbed well into trees affected.

The vote was adopted with enthusiasm, as was one to the Chairman, proposed by Dr. Hogg, and the proceedings were adjourned till the morning.

#### FRIDAY'S DISCUSSION.

The proceedings of the Conference were resumed and concluded on Friday last.

Mr. H. J. VEITCH presided, and said that, important as had been the papers which had been read and discussed during the past two days, he thought they would agree with him that those to be read to-day were equally important, and the Council invited full discussion upon them. He, however, wished to emphasise the remarks of the President on the opening day, that as the Royal Horticultural Society was a society of peace and good will, he hoped those who spoke would carefully abstain from anything of a political nature.

Mr. BAILLIE (Chester) then read his paper (p. 467).

Mr. Baillie, in replying to a vote of thanks, added that the beautiful grounds at Chiswick seemed to suggest a far wider sphere of usefulness, inasmuch as they could be made the centre of national education

for the promotion and advancement of horticulture in whose interests they were now pleading. It seemed to him that there was a reserve at the command of the Council that could not be got in any other centre in England, and it would be a disgrace, if not a disaster, if the best use, nationally, were not made of it.

Mr. TALLERMAN then read his paper on the railway difficulty in relation to fruit and how to deal with it. At its conclusion he moved—"That the Council of the Royal Horticultural Society be requested to form a committee to act on behalf of the fruit growers of the United Kingdom in connection with the approaching adjustment of railway rates about to be made by the Board of Trade, and that such committee enlist a full amount of Parliamentary support to carry out these views."

Mr. R. DEAN said he would second the motion for the sake of raising a discussion.

Mr. SHIRLEY HIBBERD observed that he was not in opposition to Mr. Tallerman, and he agreed with many present that the Conference would be a dead letter if they stopped at that point. Many useful and important matters had been discussed, but the subjects referred to that day—market tolls, railway rates, &c.—were at the very root of the whole question of the development of fruit culture in this country. They did not want party politics there; he did not know to which party he belonged, but he should like always to be found on the side of reason and justice! All they wanted to do at present was to continue their inquiries, which must be conducted with experience and judgment. He desired something more definite than the proposal contained in Mr. Tallerman's motion, and he would consequently move the following amendment:—

"A conspicuous result of the Conference this day concluded is to make it evident that the subject of commercial fruit culture is one of great and growing public interest, and that there exists a corresponding desire to remove or modify the various impediments that law, usage, and misconception of facts have created and sustained against it. The Royal Horticultural Society having special facilities for obtaining and diffusing information on all that relates to horticulture, this Conference respectfully requests the appointment by the Council of a Law and Parliamentary Committee for the consideration of the impediments above referred to."

Mr. JOHN CORNER seconded the amendment, which was formally supported by Mr. Geo. Bunyard.

Mr. SHIRLEY HIBBERD, on being asked by various speakers to do so, objected to alter his amendment in any way for any one in the world.

Mr. J. K. FOWLER did not at all object to Mr. Hibberd's amendment, but he thought they would have much greater weight with the railway interests than with Parliament if they concentrated their views exactly as Mr. Tallerman had stated. As a late railway director he (Mr. Fowler, certainly knew something of the subject, and he considered that more was expected of railway companies than they could actually perform. Railway companies had been of enormous benefit to the country in the development of agriculture and commerce, and the manufactures of the nation, but he did not deny that they were greatly standing in their own light not to advance more with the times, and to do away with the injustice which it was generally agreed existed throughout the country. He was one of the judges at the great Kilburn show when a prize was given by the Lord Mayor of London for the best van for the transmission of meat, fruit, and other things from different parts of the country. The judges spent eight days in coming to a decision, and finally awarded, after a very severe trial, the prize to the Glamorganshire Company, greatly to the disgust of some Americans, who had sent vans which were expected to carry all before them. Up to the present time, however, he believed that not a single railway company had adopted the Glamorganshire Company's system. He merely mentioned that circumstance to show that, if the matter were properly placed before the companies, they would do all they could to meet the requirements of the public. He had the greatest pleasure in supporting the motion of Mr. Tallerman.

Mr. Hibberd's amendment was ultimately carried with four dissentients, and the following motion by Mr. Tallerman, seconded by Mr. P. Crawley, was carried:—"That, in the event of the committee being appointed, this Conference desires to urge upon it the early consideration of railway charges as affecting the growers of fruit and vegetables."

The CHAIRMAN proposed a vote of thanks to the readers of papers, which was carried.

Mr. BUNYARD proposed a vote of thanks to their excellent Hon. Secretary, Rev. W. Wilks, to whom and the Council the successful issue of that exhibition and Conference was due.

Mr. WRIGHT had the greatest possible pleasure in seconding the motion, which was carried with acclamation.

Rev. W. WILKS said it was a pleasant thing to be thanked for doing what one liked, and he assured them his services on behalf of horticulture and fruit growing were always at their disposal.

Mr. MALCOLM DUNN having spoken a few words of congratulation, moved the following resolution:—

"In view of the great public advantages that have accrued from the previous Conferences held in these gardens, and the marked success of the present one, the members of the Executive Committee of this Conference, Fellows of the Royal Horticultural Society, and other horticulturists here assembled, who are deeply interested in the Society's welfare, and in the important question of developing the progress of scientific and economical horticulture, including especially the fruit-growing capabilities of the country, respectfully submit for the earnest consideration of the Council of the Society the desirability of concentrating the Society's resources to the utmost practicable extent upon the maintenance of the Chiswick Garden, so as to enable it to fulfil its mission as the national exponent of practical and experimental horticulture."

Dr. MASTERS.—I have the greatest pleasure in seconding this resolution. If I may address you, sir, as one of the Council, and all the members of the Council present, I would especially say that you must not neglect the interests of Chiswick. You must throw all your energies into the development of this garden. This is no mere sentiment—although sentiment in this matter goes a long way. The gardeners of the kingdom have Chiswick in their hearts. One of the most essential requirements of a horticultural society is, moreover, an experimental garden. I am sorry to say that the public in general do not read—at least do not read with appreciation. But it is a very different thing when they come into this garden and see for themselves what has been done, and their minds take it in much more readily than from the printed page. I strongly uphold an experimental garden for educational purposes. It is also a great trial ground. Nurserymen and seedsmen have a prejudice in favour of their own seedlings, but when they send their seeds and plants to these grounds they are tried without favour. I have, therefore, great pleasure in seconding the motion.

Mr. WRIGHT thought the matter should have the careful consideration of the Council.

Mr. ROUPELL expressed the hope that now the London exhibitions were over those beautiful gardens would receive a larger share of the public favour.

Mr. SKEE said they had not done half what they should do, because their means were limited.

The resolution was carried with enthusiasm.

Mr. CHEAL moved a vote of thanks to Mr. Barron, the able Superintendent of the gardens.

Mr. DEAN seconded the motion, which was carried unanimously.

Mr. BARRON having suitably acknowledged the compliment,

Mr. TALLERMAN moved a vote of thanks to Mr. Veitch for presiding.

The CHAIRMAN briefly responded, and the proceedings terminated.

#### DISHES EXHIBITED.

The following enumeration shows the number of dishes of certain varieties that were exhibited, and affords some indication of the relative popularity of the varieties named. The first twenty only being given:—

APPLES.	Dishes.	PEARS.	Dishes.
1. Warner's King	78	1. Marie Louise	56
2. Blenheim Orange	70	2. Louise Bonne of Jersey	55
3. King of the Pippins	69	3. Beurré Diel	50
4. Cox's Orange Pippin	64	4. Pitmaston Duchess	47
5. Dumelow's Seedling	65	5. Beurré d'Amabilis	41
6. New Hawthornden	61	6. Clairgeau	34
7. Lord Suffield	56	7. Doyenné du Commerce	29
8. Elston Pippin	52	8. Glou. Morieu	29
9. Stirling Castle	53	9. Duchesse d'Angoulême	29
10. Cox's Pomona	53	10. Marie Louise d'Ucle	27
11. Borkilville Seedling	52	11. Maréchal de la Cour	25
12. Beurré de la Reine	52	12. Beurré Bachelier	25
13. Emperor Alexander	46	13. Superfin	25
14. Worcester Pearmain	41	14. Bergamotte d'Espérance	24
15. Lane's Prince Albert	33	15. Curé's Beurré	24
16. Peasegood's Nonpareil	32	16. Josephine de Malines	23
17. Alfriston	32	17. Beurré Bosc	23
18. Lord Derby	30	18. Hardy	23
19. Beauty of Kent	30	19. Uvedale's St. Germain	22
20. Golden Noble	29	20. Duroseau	20

## VARIETIES CERTIFICATED.

The following is a list of the varieties to which Certificates of Merit were awarded. The numbers in parentheses refer to the number of times the variety was Certificated; these numbers thus affording evidence of the degree of merit of the particular varieties, as exhibited on this occasion, from various localities.

## APPLES.

- Adam's Pearmain (2)  
Alexander (2)  
Alfriston (1)  
Alma Pippin (1)  
Anne Elizabeth (2)  
Baumann's Red Reinette (2)  
Beauty of Kent (2)  
Bismarck (2)  
Blenheim Orange (3)  
Bramley's Seedling (5)  
Cellini (5)  
Cockle's Pippin (3)  
Court Pendent-Plat (1)  
Cox's Orange Pippin (3)  
" Pomona (5)  
Domino (2)  
Duchess of Oldenburg (2)  
Eckliaville Seedling (3)  
Egremont Russet (2)  
Farr's Pippin (1)  
Frogmore Prolific (1)  
Gascogne's Seedling (1)  
" Scarlet (1)  
Golden Noble (4)  
" Spire (1)  
Gospatric (2)  
Gravenstein (2)  
Grearland (3)  
Herefordshire Beaufin (1)  
Hornsea's Pearmain (2)  
Kerry Pippin (1)  
King Harry (1)  
King of Tomkins's County (1)  
King of the Pippins (1)  
Lady Henniker (3)  
Lady Sudley (2)  
Landsberg Reinette (1)  
Lion's Prince Albert (2)  
Loddington House (2)

## PEARS.

- Autumn Bergamot (1)  
Baronne de Mello (2)  
Bergamotte d'Espere (2)  
Beurré d'Amanlis (3)  
" d'Anjou (1)  
" d'Arenberg (1)  
" Bachelier (8)  
" Baitet Père (2)  
" Bosc (5)  
" Clairgout (1)  
" Diel (5)  
" Hardy (5)  
" Rance (1)  
" Sterckmanns (2)  
" Superba (3)  
Catalpa (3)  
Clapp's Favourite (1)  
Comie de Lamy (2)  
Doyenné d'Alençon (1)  
" Bouschoff (7)  
" du Comice (7)  
" Dorandean (1)  
" Dr. Jules Guyot (1)  
Duchesse d'Angoulême (2)  
Ester Beurré (1)  
Emile d'Heyst (1)  
Fondante d'Autonne (4)  
Ginsel's Bergamot (3)

smaller blunt flowers, and totally distinct lip. My typical specimen has thirteen flowers. It is also called "hybrida picta." *Cattleya flaveola* is exceedingly elegant to my taste. It is also near *Cattleya* sextus, but that has much broader blunt acute sepals and petals. *H. G. Rehb. f.*

## CATASETUM FULIGINOSUM, Lindl.

Another species of *Catasetum* is revealing the little secret which some of the species, at least, seem so well able to keep. For a considerable time it has been noticed that a plant in the Kew collection was throwing up two quite different kinds of inflorescence, one on either side of the same pseudobulb, and this plant has in consequence been watched with an unusual amount of interest. The difference between the two gradually became more apparent; the one raceme was erect, with but few short and very stout buds near the apex, the other much longer, gracefully arching over, and bearing a large number of much more slender pointed buds for the greater part of its length. At length the flowers expanded, so totally diverse both in shape and colour, that nothing short of their being borne by the same plant would lead one to suppose they had anything to do with each other. Such, however, is the case—they are simply male and female flowers of the same species, and the plant forms an object of interest unsurpassed in the whole collection. A name was next wanted for the plant, and as far as the male flowers are concerned I was totally unable to find one, or to match them with any dried specimen or figure. The female flowers, on the contrary, seem perfectly identical with those of a plant which flowered with the Duke of Northumberland at Syon House in 1841, and which was named by Lindley *C. fuliginosum* (*Bot. Reg.*, xxvii., *Misc.*, p. 78). This Lindley guessed might be the female (male by a misprint) form of *C. atratum*, or some such species. "This, however," he remarks, "must remain for future inquiry." So exactly does the Kew plant agree with Lindley's dried specimen that I have no doubt of the identity of the two. These female flowers are green, with dull purple-brown spots and splashes, especially on the lip. The spreading segments are oblong and acute, and the very fleshy hood-shaped lip uppermost, the column very short and stout, stigma and ovary perfect, while the anther is reduced to a mere abortive rudiment. The male flowers are very similar to those of *C. callosum*, though quite distinct. The sepals are narrow and concave, a little incurving at their tips, the petals a little broader, flatter, and a little reflexed. Both are of a lurid purple-brown, the former faintly, the latter distinctly flecked with spots of a darker shade. The lip is pendulous, not uppermost, as in the other sex, of a dull green, densely covered with very dark or nearly blackish spots, oblong in shape, narrowing a little upwards, a little and irregularly toothed on the margin, slightly tridentate at the apex, with a shallow cavity behind, on either side of which are situated the two equal cirrhi; finally, the slender column has the anther alone perfectly developed. *C. deltoideum*, Lindl., is very similar, but readily distinguished by the very broad-based lip. Such is this marvellous plant—a few more freaks, and *Catasetums* should become popular. It was received at Kew from Mr. F. Sander, of St. Albans, having been obtained by him from British Guiana. *R. A. Rolfe.*

useful method of growing the plant is to train a few shoots up a piece of twine, which, when required, can be taken down and used in a variety of ways; but especially is this form useful in house decorations, where they may be twined wreath-like round any object or along the edges of stands and baskets of plants; and in warm rooms, with a fair amount of light, it is surprising how long the *Asparagus* lasts in good condition. It is also a good rafter or pillar plant for the greenhouse, and in which place and position it is better to grow the plant for cutting from. The lighter and airier the position is the better, and a winter temperature, not falling below 45°, suits it well. A free, loamy compost is proper, and the richer it is the more luxuriant will be the growth.

There is more than one variety of the species, and that known as *A. plumosus nanus*, with its flat Fern-like branches, is the one usually illustrated in catalogues, and which by some is considered the best variety; but the variety originally introduced under the name of consanguineus, and generally met with as tenuissimus, is probably the most accommodating, and it is easily distinguished from the other by being of a more scant habit; it has a less prickly stem, its branchlets are arranged in a more verticillate manner, and the whole plant is usually of a lighter green colour. This variety is easily increased by cuttings, whereas the other, for some reason which I do not know, is not easily increased in this way. All species of *Asparagus* are, however, easily multiplied by division of the rootstock and also from seeds, which they sometimes produce in quantity. In propagation by means of cuttings, rather stout pieces, from 4 to 6 inches long, should be chosen; and after making them in the ordinary way dibble them firmly into small pots filled with a sandy compost, and stand them in the propagating or other moist house where the temperature is kept at from 60° to 65°. Give a good watering to the cuttings when they are put in, and this, with an occasional moistening with the syringe, and a slight shade from bright sunshine, will be generally sufficient until rooted, when they should be potted on intact. When single plants are desired it is necessary to single out and pot on the strongest plants in the usual way, but this last method requires patience and time to make nice bits; moreover, more care is required in potting off single plants, the young roots being easily broken off. *F. Ross.*

## FLORISTS' FLOWERS.

## AMARYLLIS.

It is the resting-time with *Amaryllis*—or, at least, what is regarded as the resting period—but no bulbs are at any time in a quiescent state; leaf and bud are even now in course of development. The compost should be prepared for repotting them in January, and should consist of loam, two parts; peat, one part; decayed manure, one part; leaf-mould, one part; and some sharp sand added to make the soil porous. This should be laid up out-of-doors, and need not to have protection from rain unless there is some danger of its becoming too wet. Some small pieces of charcoal are mixed with it when potting the bulbs—not before. The leaves of the *Amaryllis* began to decay rather early this season on our plants, and were all removed from the plants by the middle of September. There is always a certain quantity of decayed and decaying material at the crown of the bulbs. We have removed all this, as it too often contains the insects, or the larvae of insects, which injure the plants.

To make certain there is no insect in hiding, the crowns are also well dusted with tobacco-powder. The house is kept cool now, with just enough artificial heat to keep out the frost, and the atmosphere of the house should be as dry as it is possible to keep it. The crowns of the bulbs, especially those of large size, are easily injured by damp; in fact, they ought to be occasionally inspected to see if decay has appeared. The plants raised from seeds

## NEW OR NOTEWORTHY PLANTS.

CATTLEYA FLAVEOLA × (INTERMEDIA × GUTTATA) ? n. *Hyb.*, Angl.

Mr. F. TADZ, Studley House, 289, Goldhawk Road, London, W., has kindly sent me the fine flower of this hybrid, which I am informed was raised by Messrs. Backhouse, Holgate House, York.

The flower gave me at first the impression of a yellow *Laelia* elegans. It is equal to a middle-sized flower of that species, and has ligulate, rather acuminate sepals and petals, broader in the middle, all of a pale clear yellow, coming very near to the lightest sulphur colour. The lip has much the shape of that of a *Cattleya guttata*. The side laciniae are semi-cordate at the base, oblong, prolonged into a long semi-lanceolate apex equal to the narrow claw of the mid-lacinia, which extends into a transversely oblong emarginate, crenulate rugose mid-lacinia. The whole mid-lacinia is purple as on the tops of the white side laciniae, both inside and outside. The column is very plump, white, purple at the top.

*Cattleya picturata* × *Rehb. f.* may be compared to it from its origin, but it is widely distinct in its

## ASPARAGUS PLUMOSUS.

This handsome evergreen species is, without doubt, one of the most ornamental plants which has been introduced of recent years, its slender branching foliage being very useful for cutting purposes, lasting a long time without flagging; it is also a capital subject for growing in pots for general decorative uses, and when it is intended to use it in this way it may be had either dwarf or tall as desired; if the latter, then insert a stake or other support in the pot of the required height, and top the shoots at this level, which will induce them to break lower down and form well-furnished specimens. If very dwarf plants are required then it is enough simply to pinch the young growths when a foot high, and bright Fern-like plants may be produced in this way. Another

sown in August last are yet of a dark green colour. A house with a temperature of 50° to 55° at night suits these very well, and just enough water should be afforded them to prevent the soil becoming too dry; in fact, if these young plants get a liberal supply of water during winter the bulbs get into such bad condition by the time they have to be repotted that many of them will not live, and the remainder will make no satisfactory progress.

#### THE CALCEOLARIA.

The winter season is a season of growth for this plant. The Calceolaria does best in mild winters, being rather impatient of artificial heat, and grow healthy and quickly when the leaves show tiny dew-drops round their margins in the early morning. What they do suffer from is the drying frost winds by day, and artificial heat by night, which sometimes becomes necessary to keep out the frost.

Great attention must be paid to attacks of aphids, which will often occur after weakening periods of hard weather and the consequent excessive fringing. Repot the plants when they require it, but not before. In repotting any plants at this season it ought to be done carefully. The potting soil ought to be in a medium state of dryness, as also the roots, and after the plants are repotted they should not have any water for a week at least; by that time the roots will have penetrated the new compost, and be in a state to take up moisture. The plants should be placed near the glass roof now, as full light is necessary to promote a healthy development of the leaves and a short-jointed growth.

#### THE CINERARIA

requires very much the same treatment, but it is not so hardy as the Calceolaria, and a very few degrees of frost will kill it. It is sensitive to cold, drying winds, and the brittle leaves, downy on the under side, soon show the effects of having been exposed to such winds. I grow most of my plants now from offsets, which are obtained by breaking up the old plants after they are cut down and have again started to grow. These make quite as good plants as seedlings. The potting soil for these, and also for the Calceolarias, is of decayed turfy loam, a fourth part of decayed manure, and as much of leaf-mould and sand. In order to have good specimens, the point of the rising flower-stem should be pinched as soon as it is perceived, which will cause the plant to throw out branches from the crown, and as it continues to grow these should be tied out so as to form a spreading head of bloom. *J. Douglas.*

#### PINK LORD LYON.

This is the true name of the fine early flowering Pink, which Mr. Douglas so strongly commended a few weeks ago. It was named by the raiser, the late Mr. James Clarke, of Bury St. Edmunds, after the Derby winner, Lord Lyon, and not after the celebrated Admiral and Ambassador Lord Lyons. Mr. Douglas states, and rightly enough from his point of view, that pipings should be struck in a gentle bottom-heat; but as it is a Pink deserving to be widely known and grown, and therefore by very many who have no command of bottom-heat, the question arises, How can it be propagated without it? I do it in two ways—1st, by placing a few pipings in pots of light sandy soil as early in the season as I can get the cuttings, and plunging the pots up to the rims in a bed of cocoa-fibre under the shade of a wall. It is a slow process, but I get some of the pipings to root. It is necessary to do it early in the season, so as to give time for the pipings to root and grow into size. I can also extend my stock by dividing the plants at the end of the summer; it is of a free growing character, and stock can be increased in this way. I remember once calling upon Mr. Clark at Bury St. Edmunds, and he showed me his method of striking Pink cuttings. He simply made up a bed among his Gooseberry trees, put the pipings into it and covered them with an ordinary handglass, and experienced but few failures. Those who strike Pinks from pip-

ings will find a handglass very useful for the purpose. A kind of homely frame can be made by taking a wooden box 6 or 8 inches in depth, making a bed in it for pipings, and when filled laying some putty along on the rim of the box, and a piece of glass over it, pressing it down firmly on to it. Many can be struck in this way, but it is not so convenient as the ordinary handlight. I always flower a few plants of Lord Lyon in pots to have some early bloom. As soon as the beauty is over they are turned out of the pots and placed in the open ground to perfect their growth, placing some good light free soil about the roots, and giving occasional top-dressings. I can bear testimony to the statement of Mr. Douglas, that it is the best purple Pink in cultivation. *R. D.*

## PLANT NOTES.

### BROMELIADS.

SOME kinds of these may always be seen in flower at Kew, and many of them deserve to take rank with the very first of stove flowering plants; others are too large for ordinary houses, but where space can be afforded them they make a great show. Amongst the large kinds now flowering at Kew are two splendid species of Karatas. *K. Legrelle*, in the Victoria-house, has rigid green leaves, 3 feet long, 2 inches broad, channelled with stout hooked spines on the margins. The inflorescence is central, and is in the form of a thick cone, from which spring about twenty coloured leaves, which vary in length from 2 feet to 3 inches; they are similar in shape to the ordinary leaves, but their colour is a shining brilliant scarlet. *K. anticantha* is in the Water Lily-house; it is similar to *K. Legrelle*, but larger, the leaves brownish at the base, and those on the flower-head are a deeper shade of scarlet. Travellers say that in the Brazilian forests these plants may be discerned by their flowers a great distance off, and it has been suggested that they must be intended to attract humming birds, &c., which assist in fertilisation and in the after dissemination of the seeds, for the coloured leaves remain till the seeds are ripe.

### ECHEMA FULGENS.

This and its variety *discolor* are very handsome when in flower, and they last about two months in perfection. The type has leaves about 1 foot long, channelled, smooth-edged; the inflorescence springs from the centre of the rosette formed by the leaves, and is 18 inches high, branching, in the upper half, and bears from seventy to a hundred flowers, each of which is half an inch long, egg-shaped, and coloured a brilliant coral-red, tinted with purple at the tip. The variety has a similar inflorescence, but differs in the foliage, which is longer, deep olive-green, with grey bands, purplish on the under side. Certainly these two plants deserve to be grown in every collection of stove plants.

### PUTA LANGUINOSA.

noted a short time ago, is still very handsome. The scape is now over 4 feet long.

### BROCCINIA CORDYLINOIDES.

This is also in flower. It is a giant, but the flowers are of no horticultural value.

### HILLIA LONGIFLORA.

This a stove shrub which does not appear to be known in English horticulture, although it was in cultivation here at the beginning of the century. It is *Rubiaceae*, a relation of *Luculia* and of *Bouvardia*, but very unlike either. The habit and appearance suggest *Eschynanthus*, the leaves being ovate acuminate, 4 inches long, shining green, in pairs on every part of the plant, which is 2 feet high and freely branched. The flowers are solitary on the end of the branches, and they are 5 inches long, the tube being narrow and stalk-like, and the limb six-spreading segments, each 2 inches long, narrow,

radiating, suggestive of a *Strophanthus*, or, if you like, an octopus. The whole flower is creamy-white, very fragrant, and it lasts about a fortnight. The plant is well worth growing in representative collections of stove plants. There are five species of *Hillia*, all of them natives of the tropics of the New World, where they are said to be epiphytic on large forest trees. *H. longiflora* is in flower in the stove at Kew. *W. Watson.*

## ORCHID NOTES AND GLEANINGS.

### ORCHIDS AT SUMMERFIELD HOUSE, LAWRIE PARK.

It is about two years since I last had the pleasure of looking over the collection of Orchids of Augustus Sillem, Esq., at Sydenham, Kent. When so long a period has elapsed a single glance will tell whether there has been improvement in the condition of the plants, or the reverse. In this instance it is our pleasant task to report a decided advance in this respect; and especially as regards the *Phalenopsis*, which reflect great credit on the gardener, and remind one of the grand plants at Mr. Partington's at Cheshunt. The plants are grown in baskets of Teak, suspended near the roof, and the growth made during the present year is beyond anything I have previously observed. For instance, a plant of *P. grandiflora* has made six large leaves during the present year; two of *P. amabilis* have made four large leaves each. As is usual, the largest leaves are on *P. Schilleriana*, and one of the largest, measured 11 by 5 inches, another fine leaf was 15 inches long; *P. Sanderiana* had leaves, or at least the largest leaf was 5½ by 12 inches—a wonderful growth. The plants are now showing spikes in proportion to the size of the leaves; *P. amabilis* has a good spike, with the first flowers (few) open; *P. violacea* has very pretty yellow and rosy-purple flowers; a plant of *P. Esmeralda* had a spike about 2 feet long, well furnished with flowers of a rich amethyst colour.

*Cypripedium*, though few, are well grown here, and especially *C. Spicerianum*, of which about half-a-dozen plants were producing in the aggregate fifty-four flowers; and amongst them one very handsome form. *C. Haynaldianum* had two vigorous spikes with four flowers on each; the flowers are of the *C. Lowii* form, and the plant, although its flowers are quite distinct in colour, may be only a variety of that species. The elegant little *C. caricinum* (Pearcei) is quite distinct in its sedge-like growth and creeping rhizomes. One plant of it had continued to produce its pale greenish-yellow flowers for the last three months.

Among the *Cattleyas* I observed a few good things—a *Lælia prestans*, with remarkably large and brilliant flowers, 4½ inches across, the width of petals being 1½ inch; *Cattleya marginata* was also in flower, and is very pretty. It will be known to most orchidists that these dwarf *Cattleyas* and *Lælias* have now been brought under the specific name of *Lælia pumila*—a plant figured in the *Botanical Magazine*, plate 3656, under the name of *Cattleya pumila*.

*Cymbidium giganteum* was a very prominent plant, with two good spikes. It is, when well grown, a noble plant, and should be more common in collections. The flowers are of large size, and the sepals and petals yellowish-green with distinct, brownish-purple stripes; the lip is yellow, irregularly spotted, and blotched round the margin with crimson. The flowers last in good condition a long time.

*Odontoglossum Inseayi splendens*, true, was in flower. It is an uncommon plant. The flowers are large and very handsome, with a rich yellow lip edged with crimson blotches; the sepals and petals brown and gold.

*Miltonia candida grandiflora*, better known twenty years ago than it is now, is a handsome form of this species, and quite distinct; the lip is white, with a delicate rosy flush at the base; sepals and petals yellowish-white thickly blotched reddish-brown.

Several varieties of *Oncidium Forbesii*, *Cattleya Loddigesii* alba, *Vanda corulea*, *Barkerias*, and a few other plants, made a fairly good, seasonable display. *J. D.*

#### CATTELEYA PUMILA.

This plant, noticed in the account of Mr. Sillem's Orchids, p. 474, was described by Sir W. Jackson Hooker as one of small size, "the minute rounded pseudobulbs and the narrow leaves, together with the obtuse, short, and almost emarginate lip, will, I think, clearly distinguish it from those hitherto described." It had been sent to a Mr. John Alcard from Essequibo, and who flowered it just fifty years ago. There is much confusion amongst this section of Orchids, but Messrs. Veitch, in their *Manual of Orchidaceous Plants*, give *L. pumila* specific rank, and have expunged *Cattleya marginata*. This was introduced in 1842 by M. Pinel, a French merchant, who sent *L. pumila* under this name to M. Morel of Paris. Lindley also figured it under the name of *Cattleya pumila* in the *Botanical Register*, 1844, t. 5. He also says it is a native of Brazil, and could not be found at Essequibo. An allusion is made to its name of *C. marginata* as "expressing the appearance of a beautiful pale border to the blood-red blotch of the lip." C. Pinelli was also alluded to as having been received from Messrs. Rollissons. The flower had white sepals and rose-coloured straight, not curved, petals. *C. spectabilis* of *Paxton's Flower Garden* is also *L. pumila*. The correct arrangement is, therefore, as follows:—The type form, *L. pumila*, *L. p. var. Dayana*, *L. p. var. præstans*. *J. Douglas*.

#### CATTELEYA BOWRINGIANA.

A fine batch of this useful autumn and mid-winter flowering Orchid is now in bloom at Messrs. F. Sander & Co.'s nursery at St. Albans. Some of the spikes bear fourteen flowers, each being a bouquet in itself. The importation has been prolific in fine varieties, their colours varying from pale lilac to bright rose. No pure white variety has yet appeared, but the importation is watched with interest for one to unfold its flowers.

## CULTURAL MEMORANDA.

#### POLYGALA DALMAISIANA.

This is a strong growing and free flowering greenhouse plant, of drooping or trailing habit, producing pea-like flowers of a bright Peach colour from the points of the shoots. From November onwards cuttings of the young growth may be taken and inserted round the edge of 3-inch pots filled with peaty soil and having a surfacing of silver-sand; put in heat, watered, and kept close until rooting takes place. They should then be potted off singly into the same sized pots, shifting them into larger pots as they require it. Plants in  $\frac{1}{2}$  inch and 6 inch pots—their flowering shoots being allowed to hang over the edges of the stages in the greenhouse and conservatory—are effective and pleasing. The shoots should be pinched two or three times in the earlier stages of growth to cause them to branch freely.

#### PRIMELEA HENDERSONI.

At the present time this pretty, hard-wooded greenhouse plant is not met with so frequently as it used to be some twenty years ago. This is to be wondered at, as plants of it in pots ranging in size from  $\frac{1}{2}$  inches to 15 inches in diameter, are very effective and useful decorative subjects. The flowers, of a beautiful pink colour, are produced from the point of the shoots during the summer months. The plant is easily propagated from cuttings of the young growth, treated as recommended for *Polygala Dalmaisiana*.

#### CYCLAMENS.

Plants now developing flowers will be benefited by being watered two or three times a week with tepid liquid manure, and an occasional surface-dressing of Beeson's bone manure may be afforded. Seed may now be sown for flowering next autumn, using

seed-pans from 9 to 12 inches in diameter, and from 3 to 5 inches deep, drained efficiently, and filled with a mixture of three parts light sandy loam and one of leaf-soil. In sowing the seed cover it lightly with the soil, and place the pans on a shelf in a stove or warm pit, where the temperature is not likely to rise above 55°, or fall below 50°. When the seedlings are large enough to handle prick them out into pans or 6-inch pots, and into a like kind of soil; water with a fine-rose pot, and place again in heat near to the roof-glass. In due time pot them off singly into small 60's, making the soil moderately firm about the roots, and keep the plants in a growing state, the object being, not to check growth from the time they have started into leaf until they have done flowering, but shifting them into larger pots as they require it, and treating them in the way indicated. *H. W. Ward*.

## PLANTS AND THEIR CULTURE.

THE CONSERVATORY.—The majority of the summer-blooming soft-wood plants being now over, and those with tender foliage being removed to warmer quarters, as also the dwarfier and more select of the hard-wooded plants to positions where their requirements can be suitably met, the opportunity is afforded of giving those that are left and the permanent subjects a thorough cleansing before re-arranging them for the winter. One of the most important points in the management of a conservatory is thorough cleanliness, for, however artistically it may be arranged, shortcomings in this matter are almost sure to obtrude themselves, and which detract very much from the full enjoyment of this part of a garden. Being more often than otherwise contiguous to the mansion, its use as an agreeable retreat or lounge is frequently considered of more importance than the conditions most favourable to plant growth; therefore at all times endeavour to have it sweet, clean, and tidy, with as much show as possible. Many climbing plants, as *Bougainvillea*, *Passiflora*, *Plumbago*, *Bignonia*, may have their shoots thinned out and be partially cut back, and regulated in such a manner as to admit the fullest light possible to the plants beneath. At the same time the glass, woodwork, floors, pots, should be made clean. Where the house admits of it, much may sometimes be done to give new interest by simply changing to fresh positions some of the permanent inmates, and by introducing groups of plants with either foliage or flowers of one colour in prominent positions. Many other ways and means will readily suggest themselves to the gardener.

*Ananias*.—As the display of bloom next year will depend in a great measure on the preparation of the bulbs the previous year, effort should be made to ripen and mature them thoroughly; and any bulbs which have made a late growth and have not yet finished growing had better be encouraged in their growth until the last set of leaves becomes full grown, when, as in the case of the main portion of the stock, they may be gradually ripened by placing them in a house having a warm, dry atmosphere. When the leaves begin to turn yellow less and less water may be afforded the plant at the root, but do not suddenly withhold water to such an extent that the leaves flag very much, although a little flagging would not matter. Those bulbs which have been already matured should be kept quite dry and stored away for the winter. If the pots are laid on their sides they may be stored under the stages of the greenhouse, of course keeping them dry till the time for starting them in spring comes round.

*Camellias*.—The present is an anxious time, as one is eager to ascertain if any of them are likely to drop their flower-buds, an evil against which precaution should be taken. Take care, therefore, that the soil does not get dry, and should there be any shortcomings in the supply of water at the root—and this is specially to be guarded against in the case of large plants planted out and in large tubs. It is a good practice to form a ridge of soil about 1 foot from the stems of plants in tubs, and sometimes it is requisite for those in borders, and to pour the water inside of the enclosure, thereby ensuring the proper wetting of the centre of the ball—the outside soil usually gets

enough water. Where practicable, occasionally give the plants a heavy syringing; this not only cleans the foliage but keeps the buds plump. If the buds stand too thickly take off one quarter of the number now, and later, if none fall, one quarter more. *F. Ross, Bletchingley*.

## THE FLOWER GARDEN.

SHRUBS.—This month is perhaps one of the best in the year for lifting and transplanting evergreens, except hollies, trees, and shrubs; but in the event of inability to begin such work now, advantage may be taken of fine open weather between now and the end of next March. Where new plantations are to be made the soil should be trenched two spits deep, and if of a poor character it will be found advantageous to work in with the staple a liberal dressing of manure. Heavy retentive soils should be drained, or it will be useless to attempt to grow Conifers and many of the choicer evergreens. In transplanting large specimens move them with a good ball, and in some cases such work ought not to be done unless the plants have undergone previous preparation, digging out a trench at a reasonable distance from the bole and refilling with light soil. Deciduous subjects may be moved later.

*Flower Beds*.—Those which are intended for early spring flowers may now be planted. In my opinion a bed should be planted with two distinct species or varieties and no more, and these should usually be such as will flower simultaneously, i.e., with subjects whose chief beauty is their flowers. The following plants are good for the purpose:—Wallflowers edged with *Viola Blue Bell*, *Arabis* with *Polyanthus* or double-flowered *Daisies*, *Myosotis dissitiflora* and *Alyssum alpestre*, *Erythronium deus-cani* with *Crocus*, *Chionodoxa Lucifera*, and *Snowdrops*. Each and all of the above go well together, and will be found to make pleasing beds. By way of a change foliage-plants should be employed as an edging; the two first-named look well with a broad band of *Stachys lanata* or variegated *Vinca*, and golden-leaved *Thyme* or *Sedum acre aureum* might be used with some of the others. *J. Horsfield, Heytesbury*.

## FRUITS UNDER GLASS.

MELONS.—In order to impart flavour to these fruits at this season a high and dry temperature must be kept up in the house—70° to 75° at night. In the daytime when the inside temperature reaches 80° with sun-heat a little ventilation should be afforded, closing the house so as to secure a temperature of 85° in the afternoon, and this should not sink below 75° at 10 p.m. Caution is required in watering to avoid the risk of the fruit cracking.

We have still a nice crop of fruit from pots, *Mindoe's Scarlet Premier*, *Pennrhyn Seedling*, *High Cross Hybrid*, and *Golden Perfection* are the sorts we grow. The fruits swell well for this season, and the flavour is fairly good. Fruit which is cut now will keep sound much longer in a dry fruit room than earlier in the season.

*Cucumbers*.—Plants raised from seeds sown in the beginning of August will now be in full bearing; in fact they will show a great deal more fruit than should be allowed to remain, and it is always best, in order to preserve the plants in vigorous health during the winter, to crop with moderation. As the nights lengthen and cold increases, a greater amount of fire-heat must be employed, and this means more moisture, but it is not advisable to syringe the plants much and it should be supplied principally by sprinkling the paths and beds.

Where the bottom-heat is wholly dependent upon hot-water pipes the plants must not be allowed to suffer from dryness at the root, and when the beds require water the maximum day temperature should be reached before applying it, and the warmth of the water should be 5° higher than that of the bed. Keep a quantity of friable loam, leaf-mould, and spent Mushroom-bed manure in equal parts on hand, to place over the roots whenever they appear on the surface. Prior to applying 2 inches of this dust the roots with Thomson's manure, which will be found a sufficient stimulant without having recourse to dung-water at this season. Attend to the pinching and training of the shoots with regularity, and remove all damaged leaves from the plants before decay sets in. *Wm. Baillie, Luton Hoo*.

Advertisers are specially requested to note, that, under no circumstances whatever, can any particular position in the paper be guaranteed for advertisements occupying less space than an entire column.

Now ready, in cloth, 11s. 6d.

Rooms.  
SATURDAY, Nov. 3 {

Fertility of  
Soils.

It is frequently a matter of surprise, especially to farmers, who are apt to lament the exhaustion of their soils, that gardens that have been cropped for years are so much more fertile as a rule than are their fields. There are many causes for this, such as better drainage, more thorough tillage, a more varied rotation, to say nothing of better shelter. But the main reason why the soil of old gardens is so fertile is, that there is a vast accumulation of animal and vegetable matter, containing organic nitrogen, that is to say, nitrogen in combination with carbon. From an analysis of the soil at Sir JOHN LAWES' garden at Rothamsted, it was found that such soil contained nearly four times as much nitrogen in the first 9 inches as the average of the adjoining arable soils, and nearly five times as much as the first 9 inches of some exhausted Clover-land soil.

Such richness of soil has some disadvantages. Many insects find their food and shelter in the organic matter which is undergoing spontaneous decomposition, and hence many good gardeners, when there is a considerable extent of old garden ground, fallow a portion of it, adding lime or lime rubbish, and plant green crops, such as the more hardy of the Cabbage tribe, which always grow luxuriantly in such soils. After a year or two the superfluous organic matter is converted into nitrate of lime, and is used up by the growing plants. In all soils there exist very minute forms of underground vegetation, invisible to the eye, and the function of which is to separate the

carbon and hydrogen from the nitrogen, and to unite it with oxygen. But to effect this, lime as a base must be present in the soil, and the compound so formed is called nitrate of lime. Hence the advisability of a dressing of lime or lime-rubbish, which not only destroys many insects and grubs in the soil, but helps the growing plants to make use of the rich humus of the ground.

Another advantage of this course of cropping is that nitric acid as present in the soil contains an immense amount of oxygen, and it is only those particles of carbon which are close to the surface of the soil that can have free access to oxygen; the constant stirring which the soil receives during the early growth of the plants we have mentioned is doubtless the means of continually exposing fresh surfaces to the action of the air.

Here, then, comes in another element of successful gardening, which materially affects the quantity and quality of the produce grown—we refer to the distance between the plants. A frequent fault of many persons is to plant too thickly; if allowed sufficient room the whole crop would be uniform in height and strength, producing a heavier and more equal sample. The wide distances between the plants would also allow of perfect stirring of the soil, and the complete destruction of the weeds.

All wet soils should be well drained, and all loose soils clayed or marled if possible; the first should be rendered light by repeated stirring and the addition of long fresh stable-dung, which tends to keep the soil open and admits the oxygen of the air; the latter consolidated and enriched with well-decomposed manure, and the digging-in of refuse animal and vegetable matter.

The crops should be varied as much as possible, alternating Cabbage, Potatoes, and such-like gross feeders, with Onions, Carrots, Peas, &c., increasing and economising every kind of manure, and blending it intimately with the soil by deep and constant stirring.

Whatever may have been the character of the original soil, it will in time become fertile, the only difference being that the rich alluvial soils require much less tillage and manuring to keep up their fertility; but if they are overcropped and neglected they will soon become deteriorated, and yield less than more inferior soils, which are properly managed. Few men are aware of the value of rich garden soil, compared to that of the poorer classes of soil, until they reckon the expense at which the crops are raised in either.

It may sometimes be advantageous to buy poor land, but it is so seldom to rent it, and our advice to all young, inexperienced gardeners, who are intending to raise produce for the market is, to seek for land in the richest districts, and to exercise skill and industry in keeping up its fertility, rather than in producing it where it did not exist before.

The Chiswick  
Fruit Con-  
ference.

This meeting terminated on Saturday last, the exhibition closing on the following day. We

reported last week the proceedings up to Thursday, and gave a full report of the show, the general excellence of which was a surprise to most folk, considering the season. In our present issue we resume the publication of the papers read after we went to press last week, and we give a list of the awards made. In studying these awards, which show, first, the amount of favour enjoyed throughout the country by each of the best known varieties, and, secondly, the degree of excellence of particular varieties as shown on this occasion, the objects of the exhibition and Conference must be borne in mind.

Selection, and not indiscriminate representation of varieties, still less quantity, was the main object. In this way it is hoped that the cultivator's embarrassment as to what variety to plant will be materially lessened, and that growers for profit—market growers—may learn what is most likely to answer their purpose. In this latter point there is a good deal of whimsical caprice, which is hard to account for. An Apple may have all the qualities that may be desirable, but if it is not in favour with the dealers or the public, it is valueless as a market Apple. We heard in the course of the week some curious stories about really fine samples of Cellini Pippin being unsaleable in the market.

The general impression is that the Congress was a success, the show excellent, the papers practical and to the point, and at the end a resolution was passed urging on the Royal Horticultural Society the desirability of the appointment of a committee to deal with the economic and fiscal questions raised, including railway rates; and another urging on the Council of the Royal Horticultural Society the propriety of developing the resources of Chiswick to a greater extent than at present.

Great satisfaction was felt at the line of policy followed by the present Council, and especially by the holding of so important a Conference in so appropriate a locality as Chiswick. Those interested in fruits and fruit-culture will have a good deal to interest them during the next few weeks, and the Chrysanthemums will be upon us before they or we can digest the matter properly; but one and all will thankfully appreciate the good efforts the Society has made to assert itself in so good a cause.

The New  
Vegetable.

MESSRS. CARTER showed a large basket of the vegetable known in the Paris markets as "Crosnes," at

the last meeting of the Royal Horticultural Society on Tuesday; and at the Crystal Palace hardy fruit show Messrs. Sutton also showed specimens. It really consists of the tuberous rootstock of a species of *Stachys* known provisionally as *S. tuberifera*, and closely allied to the Woundwort of our hedges. Its culture is of the easiest—in fact, nothing more is requisite than to place the tubers in the ground, as we can testify. We placed some of ours in the open border last autumn, whilst other tubers were grown throughout the winter in a pot in a cold frame, and planted out in spring. Neither the one nor the other received the slightest attention on our parts, but in spite of that, our carelessness was rewarded, as it ought not to have been, by an abundant crop. In flavour, when boiled, it is something between a Jerusalem Artichoke and a boiled Chestnut. We have no doubt, that with proper cultivation, we shall have a vegetable that will be of great service in securing variety at the dinner-table, though we cannot pretend to look upon it as more than a delicacy, of relatively little value as a food crop, though the profusion with which its tubers are formed, and the ease with which they may be multiplied by using each joint as a "set," may possibly give it some value in this respect.

It requires only little experience of what a French cook can do to foresee the variety of ways in which such an artist would dish up these dainty little tubers. We may expect, as usual, some prejudice to arise at first sight, indeed, we have heard of some people objecting to them on the ground of their resemblance to caterpillars! The resemblance is not very close, but we all know how obstructive such prejudices

are. We may add that we were indebted for the specimens we grew to Mr. HASKINGS, gardener to Sir HENRY THOMPSON, and that the tubers grown on a cold clay soil, without manure or care of any kind, were not only abundant and delicate to the taste, but when dug out of the ground were of a silvery whiteness, recalling in a minor degree the pearly lustre of bream or whitebait. Messrs. CARTER's specimens were by no means so bright in colour as our own—a fact which suggests the probability that the nature of the soil may much affect the appearance of the skin, as it does in the case of Potatos. In any

able profusion. The plant from which our figure (fig. 68) was taken is in the gardens of H. E. GREEN, Esq., Kingsford, Colchester, and is the striatifolia variety of *H. reticulatum*, distinguished by its rather broader leaves, and by a distinct white keel running their entire length. It is a showy late summer flowerer, but the flowering season can be considerably lengthened by starting at various times any bulbs that may have been at rest during the winter and early spring. It requires a distinct period of rest in a greenhouse from October onwards until March, when the first plants may be induced to recommence growth by a thorough soaking of tepid water, and by being placed in a warm pit or house where

THE NATIONAL AURICULA AND NATIONAL CARNATION AND PICOTEE SOCIETIES (SOUTHERN SECTION).—The annual meeting of the members of these societies took place at the room of the Horticultural Club, Hotel Windsor, Victoria Street, S.W., on the 23rd inst. The Rev. H. H. D'Ombain in the chair. Present also: Messrs. Shirley Hibberd, Treasurer; J. Douglas, Secretary; H. Turner, R. Dean, T. E. Henwood, J. Lakin, &c. The notice convening the meeting, and the minutes of the last annual meeting having been read, the Treasurer presented a statement of accounts as follows:—National Auricula Society.—Receipts, including balance in hand, £33; and subscriptions, £51,

FIG. 68.—HIPPEASTRUM RETICULATUM: FLOWERS RED, LEAVES STRIPED: MUCH REDUCED.

case, the skin is so thin that washing only is required before cooking, and no peeling is necessary. The plant has not flowered anywhere so far as we know, so we can only refer the reader to our previous article (p. 13, Jan. 7, 1888) and illustration for the full history of the plant so far as known.

**HIPPEASTRUM RETICULATUM.**—The original species of the above plant, generally known in gardens as *Amaryllis reticulata*, but now placed by Mr. J. G. BAKER under *Hippeastrum*, was introduced to this country from Brazil in 1777, and flowered at Mr. LEE's nursery, Hammersmith, in 1781. The flowers are bright mauve-red, with numerous cross lines of crimson colour; and when well managed, the plant produces them in consider-

able profusion. The plant from which our figure (fig. 68) was taken is in the gardens of H. E. GREEN, Esq., Kingsford, Colchester, and is the striatifolia variety of *H. reticulatum*, distinguished by its rather broader leaves, and by a distinct white keel running their entire length. It is a showy late summer flowerer, but the flowering season can be considerably lengthened by starting at various times any bulbs that may have been at rest during the winter and early spring. It requires a distinct period of rest in a greenhouse from October onwards until March, when the first plants may be induced to recommence growth by a thorough soaking of tepid water, and by being placed in a warm pit or house where

amounted to £91 12s. 1d.; and the expenditure, including prize money, £61 12s. 6d., came to £73 14s. 9d., leaving a balance in hand of £17 17s. 4d. National Carnation and Picotee Society.—Receipts, including balance, £11 6s.; and subscriptions, £39 18s. 6d., came to £50 7s. Expenditure, including prize money, £42, amounted to £52 3s. 2d.; leaving a balance in favour of the Treasurer of £7 3s. 10d. The accounts were referred to the auditors. It was resolved that the financial year should for the future close on September 29. The Chairman was requested to send a letter of condolence to Mrs. Whitbourn, widow of the late President of the Auricula Society, and Mr. Shirley Hibberd was elected President in the place of the late Mr. F. Whitbourn. Dr. Hogg, Dr. Masters, Mr. J. T. D. Llewellyn, and Mr. H. J. Veitch were re-elected

Vice-Presidents; and the following, with the Rev. H. H. D'Ombrian as chairman, were elected a committee of management for the ensuing year.—Messrs. H. Cannell, J. James, R. Dean, C. Phillips, H. Turner, T. S. Ware, W. L. Walker, and G. W. Wheelwright. The President and Vice-Presidents of the National Carnation and Picotee Society were also re-elected; and the following three added to the committee of management:—Messrs. H. W. Headland, J. Lakin, and W. L. Walker. Mr. T. E. Henwood was elected Treasurer to both Societies; and Mr. J. Douglas was re-elected Secretary. The matter of appointing judges was discussed, and eventually referred to the committee of management. The place of exhibition for next year was also discussed, and the Rev. H. H. D'Ombrian and Mr. Shirley Hibbert were appointed a deputation to wait upon the Directors of the Crystal Palace Company with a view to holding the exhibition at Sydenham. It may be remarked that the usual sum of £30, usually given by the Council of the Royal Horticultural Society to the two Societies was not forthcoming; therefore their financial position is in every way favourable.

**NOTTINGHAMSHIRE HORTICULTURAL AND BOTANICAL SOCIETY.**—The monthly meeting of the Society will be held at the Arboretum Rooms, Nottingham, on Wednesday, October 31, at 7.30 p.m. Specimen fruit will be exhibited. Mr. M. GLESON, Clumber Park Garden, Notts, will read a paper on "The Pine-apple," giving a short sketch of the distribution of the plant, its introduction to Europe, and the various methods of its cultivation down to the present time. The Chrysanthemum, fruit and Potato show will be held on Wednesday and Thursday, November 21 and 22, at the Arboretum Rooms, Nottingham. The prizes offered by Mr. R. SANKEY, Balwell, for the best essay "On the Duty of the Employer to his Gardener," will be divided as follows:—1st prize, 20s.; 2nd prize, 15s.; 3rd prize, 10s.; which will be accompanied by the First, Second, and Third-class Certificate of the Society. The essay must not exceed fifteen minutes in reading. It will be read by a competent person, who will be appointed by the Committee, and must be sent to the Secretary, sealed up, and with a number or motto, but not the owner's name, not later than Monday, December 9. The competition is open to all the members of the Society, and the papers will be read at the meeting on Wednesday December 12, at 7.30 p.m.

**"CHAMBRE SYNDICALE" OF GHENT.**—At a meeting held on the 8th inst. the following awards were made:—First-class Certificates to *Odontoglossum maculatum* Duvivierianum, from Mr. Desmet-Duvivier; to *Anthurium Scherzerianum* Madame Raymond de Kerchove, from Mr. L. Spaevandermeulen; to *Cattleya aurea* and *Oncidium ornithorhynchum album*, from Mr. Jules Hye-Leyssen; to *Odontoglossum* species and *Cypripedium Harrisonianum* (extra var.) from Messrs. Edm. Vervaeet & Co.

**RELAXATION OF THE PHYLLOXERA CONVENTION REGULATIONS.**—The Italian Government has relaxed the regulations hitherto in force with regard to the importation of the following articles into the kingdom of Italy:—1. Wine, and Grape seeds, and these without undergoing any formalities. Table Grapes, wine Grapes, and Grape must, must be packed according to Art. 2 of the Convention. 2. Cut flowers, fresh or dried, with their stalks. 3. Vegetables, as Potatoes, Radishes, Celery, Beet-root, Mushrooms, Truffles, Asparagus, Artichokes, Chicory, Endive for salads, with roots. 4. Seeds of all kinds. 5. Small seedling plants, shrubs, and other nursery stock, as also greenhouse and stove plants. These must be packed and sealed according to, and require the usual declaration fixed by Art. 3 of the Convention. The importation of these plants is permitted at the following places only:—By land at Ventimiglia, Modena, Luino, Chiasso, Ala, Pontebba, and Udina. By sea at Genoa,

Leghorn, Civita Vecchia, Naples, Brindisi, Bari, Ancona, Venice, Palermo, Messina, Catania, Cagliari, and Porto Torres.

**EUCALYPTUS.**—Mr. HANNURY sends us from La Mortola, near Ventimiglia, a spray of a most elegant Eucalyptus, with slender pendulous branches and linear leaves, with a rich perfume like that of the Lemon Verbena, but more delicate, and with white myrtle-like flowers. It is one of the most elegant species we have seen, but unfortunately at present we are unable to give it a name. We hope shortly to figure it, as in this country it would be well worth cultivating in the conservatory or winter garden.

**ACHRAS SAPOTA.**—Mr. FAWCETT kindly sends us from Jamaica a fruit of the Sapodilla Plum, in which one of the seeds is wanting and its place supplied by a second fruit—a fruit within a fruit such as has been figured in these columns in the case of the Grape, where a perfect berry is sometimes met with within the first in the place of the seed. It does not follow in such cases that there has been any change of one into the other, but simply a substitution.

**PATENT PROTECTOR SAFETY LAMP.**—A new form of lamp for household use has been put on the market by the "Protector Lamp and Lighting Company, Limited, Eccles." The invention is such an important one, as by its general use the loss of life by mineral oil lamps will be entirely prevented, that we are induced to notice it on this occasion. It would, we think, be an admirable lamp for young gardeners, who have to attend to fires at night, and which involves careful reading of the thermometers in the various houses. It is said to give the light of a sperm candle, and does not cost more than a 1d. for 120 hours burning.

**LIQUORICE ROOT.**—A report on the trade of Damascus for 1887 states that there has been a remarkable falling off in the export of Licorice root (*Glycyrrhiza glabra*) both in quality, quantity, and value. In 1886 there were 15,944 bales of the value of £10,362 exported; whereas during last year the exportation declined to 3779 bales, of the value of £1492. For the past two years there has been a brisk competition in the trade in this article, which has caused a considerable fall in the price and an overstocking of the market. The demand consequently diminished much during last year, the United States being the only country where the article is in request.

**EXOTIC CONIFERS AT GREAT ALTITUDES IN CENTRAL EUROPE.**—We learn from our correspondent at Berlin that at Schloss Berg (Wartenberg), near Donaueschingen, at an altitude of 848 metres above the sea-level, there have grown for the last eight years the following plants, and better, perhaps for the reason that they have to endure the rough north-east winds, and do not suffer from frost:—*Araucaria imbricata*, *Cedrus Deodara*, *C. atlantica*, *C. Libani*, *Abies amabilis*, *A. magnifica*, *A. nobilis*, *A. nobilis* var. *glauca* and var. *argentea*, *A. lasiocarpa* (Loviana), *A. Pinsapo*, *Sciadopitys verticillata*. During the last winter they endured a temperature of 25° R. (= 24½° F. under zero). At the same elevation, growing very well, are *Castanea vesca*, *Juglans regia*, *Azalea amona*, *Rhododendron lirsutum* and *R. ferrugineum*. Hofgärtner KIRCHNER intends to plant there a complete pinetum.

**PHYLLOXERA IN FRANCE.**—The Minister of Agriculture in France states in his report of the wine departments of the country, that flooding the vineyards has been followed with excellent results, and that the reinstating of the vineyards by means of grafting on the American Vines has warranted the experiment. Moreover, the French varieties, when so grafted, gain in earliness, and bear considerably, even in the Medoc district, without loss of fine flavour. After a good deal of research, a method has been discovered by which the vineyard can be

restored to fertility in three years. Among other results of grafting, it has been found that varieties of Medoc Grapes can be got to fruit well in the Gironde, where, by direct planting, no good result was attainable. Vines which have been planted in very sandy soil, as on the banks of the Gardon, and in the vicinity of Aigues Mortes, make great progress, and are proof against Phylloxera. We learn that in Medoc sulphur and bi-sulphide of carbon have been successfully employed against the Phylloxera, and the Bordeaux solution (sulphate of copper) against mildew, with similar results.

**THE LINNEAN SOCIETY OF LONDON.**—The meetings of the above Society for the season, 1888-89, have been fixed as follows:—1888: November 1 and 15, December 6 and 20. 1889: January 17, February 7 and 14, March 7 and 14, April 4 and 18, May 2, (Anniversary) Friday, May 24; June 6 and 20.

**AUSTRALIAN ASSOCIATION FOR THE ADVANCEMENT OF SCIENCE.**—BARON VON FERDINAND MOELLER has been elected President for the ensuing year.

**ACACIA DECURRENS (?)**—Captain BROWN sends us from Lamash, Arran, a spray of an Acacia growing there in the open air under the name of *A. decurrens*, but which, were it not for the paucity of the white meal on the leaves, we should have referred to *A. dealbata*. Whatever be its real name, the tree suggests the Riviera, or the temperate-house at Kew, rather than an island on the south-west of Scotland.

**PERTH GARDENERS' BALL.**—What may be regarded as the first ball of the season took place in the Small Hall of the Opera House on Friday night, when the Perth Gardeners held their fifth annual assembly. The hall was very beautifully decorated for the occasion. There were about forty couples present, almost all the principal gardens in the district having representatives.

**INDIA-RUBBER AND OPIUM AT MOZAMBIQUE.**—The following note on the produce of rubber at Mozambique occurs in a recently issued Consular report. The writer says:—"Rubber is obtained mostly from the lower districts nearer the sea. There are two qualities, differing in their method of preparation. The better is that drawn from cuts made in the stems of vines, and made up into balls without further preparation. The inferior quality is got by boiling the rubber-bearing stems and roots; it is white, contains much moisture, and commands a lower price than the other. The supply of rubber continues to be maintained, but cannot be expected to last very long, as in some districts the vines have all been destroyed by the reckless way of gathering employed by the natives. It has more than once been proposed to try systematic planting of rubber trees, but nothing has yet been done. There is no doubt that the supply could be increased, as well as made more certain, were cultivation gone into systematically, and the gathering of the rubber not left to the mercy of natives. The total export in 1885 was valued at £1450. Referring to the cultivation of opium, it is said that at Mopeia it has been put on an entirely new footing. In some other places—namely, at Chamo, on the Shiré, and Mafua, on the Ziwa-Ziwa—opium culture has also been under the auspices of the Mozambique Produce Company, Limited, of London.

**SPRING GROVE HOUSE, ISLEWORTH.**—This place will ever be interesting to the horticulturist as having been once the residence of one who is deservedly famous in the horticultural world—we allude to Sir JOSEPH BANKS, and in old times closely identified with the Horticultural Society—witness the Banksian Medal of the present day. Amongst the interesting reminiscences of the great naturalist, we observed Rosa Banksia growing "hale and hearty" on the gardener's cottage. It was one of the first

plants imported into this country with another sent by KEAR from China to the Royal Gardens, Kew, in 1807. The estate has been purchased by ANDREW PEARCE, Esq., of the firm of A. & F. PEARCE. Extensive alterations and improvements are being made as to replanting, &c., under the superintendence of Mr. MICKLEWRIGHT, the able head of affairs horticultural here. When completed, we hope to refer more fully to this interesting place.

**GARDENERS' ORPHAN FUND.**—We are pleased to learn that the *soirée* recently held by the Chiswick gardeners, and which gave great satisfaction to those present, has resulted in a balance of £10, which will be handed over to the Fund.

**MR. JOHN LEE.**—It will be a matter of deep concern to all acquainted with this gentleman, the "Father" of the Gardeners' Benevolent Institution, Chairman of its committee, and President of the Horticultural Club, to learn that he is dangerously ill—a fact that, in consideration of his advanced years, gives rise to serious apprehension.

**CHISWICK HORTICULTURAL SOCIETY.**—We are requested to state that the Chrysanthemum show of this Society will be held on Friday, November 16, instead of on November 15, as previously arranged and announced.

## NURSERY NOTES.

MESSRS. CANNELL & SONS, SWANLEY.

THE oft-repeated public invitation to "Come and see," has acted on me, being by nature of a retiring disposition, rather as a deterrent than otherwise. It is only right to say, that having screwed up my courage, I have been to see, that I am more than satisfied with the result, and that I decidedly recommend others to go likewise and see what Messrs. Cannell have to show at the "Home of Flowers." Moreover, from what I saw just after the nipping frosts we had in the early part of this month, I do not think it will much matter what time of the year the visit be paid, as there is sure to be a blaze of bloom in some of the houses, and sure to be something to please the visitor interested in flowers.

Situate a few miles out of the smoke and fogs of London, on a sandy loam, overlying the chalk, in a famous fruit growing district, and with an undulating surface that admits of varying aspects and exposures, it will be seen that Messrs. Cannell's nursery is well placed; but a second and still larger one is to be found at Eynsford, a few miles off.

Perhaps because of my retiring disposition, perhaps because of some natural perversity, but most probably because it was the nearest way, I entered the nursery from the adjacent railway station, by an entrance made terrible to idle beholders by the announcement that there was no admission except on business. On consideration, assuring myself that I had some business, I entered the nursery by a gateway evidently intended more particularly for the egress of goods to the adjoining railway, and found myself to my surprise among a large and representative collection of herbaceous plants. This was more than I had anticipated; particularly so as judicious selection had been exercised, and the plants cultivated were good of their kind, with very little rubbish among them. Having said that the selection was good, it will be readily understood that the plants were among the best of their kind, and anything like enumeration is unnecessary. But as a matter of physiological interest it may be worth while to note a few facts as to the action of frost. While the Dahlias presented a sorry sight indeed, and the young shoots of some pot-Vines placed in the open air were destroyed, some plants of Abutilon in flower and fruit were uninjured, as were *Galtonia candicans*, tall *Lobelia*s, *Pentstemons*, *Antirrhinums*, *Everlastings*, *Ammobium*, and the showy *Senecio pulcher*. The allusion to *Senecio pulcher* leads one to suggest to Mr. Cannell, who

has "improved" so many flowers, that he should try his hand at this, and secure a little more refinement and compactness of growth in this plant, and a little less "rough" appearance in the flowers. Autumn Crocuses, like speciosus and longiflorus, and Colchicums of various kinds, gave wonderful brilliancy to the beds. A grand bank of Indian Pinks scarcely showed a trace of the ordeal, to which they had been subjected. Much of the immunity noticed was no doubt attributable to the fine Hornbeam and Poplar hedges which traverse the nursery, and afford shelter from wind and cold. The poor Dahlias in the open suffered, apparently, one and all; had they been more sheltered, it is possible some might have been saved, and these might have been selected as the progenitors of a hardy race of Dahlias. Why not? Mr. Cannell has effected as wonderful things as that in his time. If you want a proof, just look into some of those serried ranks of low double span houses, filled to repletion with Begonias and Pelargoniums. Oh, the colours! Could this have been October 8?—the almanac said so, and I incline to think from what I saw that the aspect of Mr. Cannell's houses and the dates of the almanac will be similarly incongruous, only more so (!), on November 8 or December 8.

To attempt anything like description of the Begonias is out of the question. "Go and see," is really the best recommendation we can give. It is, however, remarkable to see how these new creations emulate in the delicacy and variety of their tints, now the Oleander, now the Camellia, at another time the Gloire de Dijon Rose, while Pæonies and Hollyhocks find their colours and even their forms closely imitated. Sturdiness of habit, size of flower, purity of colour—these are what is sought after and sought for not in vain. One sort with orange-scarlet flowers is appropriately named Mr. Upright on account of its stout erect peduncle. Novelties in stripes may be expected and if the fashion sets in that direction Messrs. Cannell will know how to fall in with the popular taste. In the meantime, in a Begonia named Octavia, they have a dwarf variety with small, double white flowers, like a small Camellia, which may be called the plant for every one. Its compact habit, profusion and continuity of bloom will secure for it admirers among all classes. The flowers, indeed, are not as large as cheese-plates, as some of the modern Begonias are, but they are none the less beautiful, while their neat, imbricating, rounded petals, may satisfy even an exacting florist.

Scarcely less remarkable are the zonal Pelargoniums, single and double, but they are not quite so novel; their ancestry dates back to a little more remote time than the Begonias, which, whether double or single, are, as it were, of yesterday. There is almost the same diversity of colour in the Pelargoniums as in Begonias, but clear yellow is wanting in the Pelargoniums, though many gleam with orange, and the Begonias do not at present show so near an approach to purple as the Pelargoniums do. Moreover, the Begonias are translucent, while the Pelargoniums, though equally pure and brilliant in colouring, are more opaque. Here, again, I refrain, of set purpose, from quoting individual varieties (send for a catalogue), but a notice of one or two must suffice. Swanley Double White, is a most useful plant, with the peduncles not too high above the leaves, the flowers, in compact trusses, white, and what they lack in "properties," is more than made up for by the profusion and continuity of bloom; Goldfinder is a rich orange, and Golden Brilliantissima is of a similar hue; Venus, one of the show varieties, has pure white flowers all of regular pelorian shape, interesting botanically and certainly very serviceable for decorative purposes. Bronzes are going out of fashion, but the tartan-plaid varieties, like Mrs. Pollock and her imitators, such as Henry Cox, still hold their ground.

It was rather consoling to find that the Chrysanthemums were not out, as more than 1200 sorts are grown here! The blaze of bloom in Begonias and Pelargoniums was quite enough for one day, and I

was amply satisfied that there will be no falling off next year when I saw the tubers of Dahlias, Begonias and Cannas being carefully put to bed to prepare them for next year, just as children used to be (query are they now?), before being taken to the theatre.

Seed stores and drying-sheds were visited, the latter unfortunately in request this autumn, as the rainy summer and sunless skies delayed progress at one end of the season, while cold frosts arrested it at the other. No doubt, however, Mr. Cannell will be able, as usual, to hold out his hand and show his seeds in his palm with as much well justified confidence as ever. *The Rambler.*

## FOREIGN CORRESPONDENCE.

FLOWERS, &c., IN BERLIN NURSERIES.

THE cultivation of pot plants has not retrogressed, and during the spring and autumn the market was a good one. Large decorative foliage plants fetched higher prices in spring than in autumn; Rhododendrons were readily sold off, Azaleas and Camellias became difficult to obtain, and Hydrangeas were much wanted. Double *Primula chinensis* are losing favour, but the single varieties sell better; Cinerarias are less cultivated. Roses, Lilacs, and other forced shrubs found purchasers at good prices and were much in request, especially Roses in pots. The summer market for Roses gets worse yearly; but Orchid cultivation increases. The export of bulbs diminishes, but that of Lily of the Valley increases with lower prices. The import of vegetables from the south and west, and also from the north, of Cauliflower, keeps down the prices; also the great quantities from the urban irrigation fields influence the market prices; the forcing of vegetables gives, in consequence of the large import, but little returns. Mushroom growing has much increased. The weather at the time for sending out trees and shrubs was good, but the orders had diminished in value. Fruit trees still hold the low prices that prevailed last year, notwithstanding a great many *châssées* were constructed, and large quantities of trees were employed. Roses held for some time a very low price, owing to auction sales of produce from central and south-west Germany, but better prices now prevail. Park trees in large quantities were sold, but on low terms. Export was good only in early autumn, but it retrograded, in so far as Russia is concerned, owing to the heavy import duty on those articles, and the export to Russia will cease, the duty being 1s. 6d. per cwt. In seeds and seed cultivation no change has taken place, except that the seeds of *Cyclamen persicum* are much more grown and sold. The prices for flowers are low. Those of Italian flowers somewhat higher because of the dry season there. The importation of flowers is a little better than last year. The prices for dried flowers and grasses ruled about the same as last year, but those for Pampas-grass are higher. French *immortelles* are backward, German straw flowers—viz., *Xeranthemum*, *Rhodanthe*, and *Acrolinium*—are much wanted.

PICEA OBOVATA.

It may be interesting to some of your readers to hear that the Siberian Fir tree (*Picea obovata*, Lindl.), is, as I supposed a long time ago, indeed, only a climatic variety of the common Fir tree (*Picea excelsa*, L.) I found the first transitional forms near St. Petersburg, in 1883, where long before, in 1863, E. Regel described them under the name *Picea excelsa* var. *fennica*. Teplouchoff found them also in the Ural and Altai. Now I can add to these another spontaneous growth at Oberhof, in Thuringia, where it grows abundantly. If the opinion of Dr. E. Regel should be correct—viz., that these forms are hybrids of *P. excelsa* and *P. obovata*—this distribution would with difficulty find any explanation. But, if as I suppose, in accordance with Mr. Teplouchoff and others, that the *P. obovata* is only a climatic variety of the common Spruce adapted to the cold northern and eastern continental climate,

such a distribution is readily explained. For this case the form found by me at Oberhof, 800–1200 metres above the sea level are, also adapted forms. The habit of this tree is quite different from that of the common Spruce, viz., columnar, like that of the *Abies pectinata*. The squamae of the cones are, as the name says, obovate, at once distinguishing it from *Picea excelsa*, L., and typica. *Udo Dammer, Berlin.*

## THE GENUS STANHOPEA.

It may be that in the years to come—probably in the near future—the Orchid family will compete with the Auricula and Carnation in the esteem of the florist. In a very out-of-the-way district in Yorkshire—Lowfields, near Kirkby Lonsdale—the Rev. F. D. Horner has his home, and there he grows the wonderful Auriculas which have made his name a household word amongst florists. There, too, he has, in conjunction with Mrs. Horner, made quite an unique collection of Orchids. Not a collection of fashionable Orchids—oh, no!—for the fashions of this world soon pass away. The whole collection might not be worth a single small plant of *Cypripedium Stonei* platytenium in money value. The house is only a small lean-to, 25 by 10 feet, in two divisions, and in front of it is a cool-house, 12 by 4½ feet only; and yet in these two houses there were in flower in December, 1887, thirty-five distinct species of Orchids; in January, 1888, thirty-five species; in February, thirty-three; in March, thirty-two; in April forty-two; in May, forty-eight; in June, fifty-four; in July, forty-one; in August, thirty-four. The promise of bloom during the autumn months is very good, and is in proportion to the other months. The two little houses are not exactly a *Refugium Botanicum*, as the collection contains many of the best species of *Cattleya*, *Laelia*, *Dendrobium*, *Angraecum*, *Vanda*, &c., but any quaint and curious Orchids find here a comfortable home and kind treatment. Amongst others the Stanhopeas are greatly valued. They give a profusion of their richly-coloured, quaint, and powerfully fragrant flowers when kept clean, and changed into fresh Teak baskets about once in three years. They are not over plentiful in the country, that is, in comparison with some Orchids; and if they became popular they would soon become very dear. Their culture is of the simplest, and owing to the way in which the flowers are produced the plants must be grown in baskets of Teak rods. The flower-spikes push downwards and vertically under the surface, so that the spikes come out between the Teak rods. The flowers rapidly develop, and soon pass away. Mr. Horner had just flowered the remarkably handsome *S. tigrina* (see fig. 69, p. 481); this is probably the most esteemed species in the genus, and it also varies very much in the markings and size of the flowers. Some varieties produce flowers 8 inches across; the variety at Lowfields was 7 inches across, and might well be named *superba*, if that name had not already been appropriated to a variety figured in the *Flore des Serres*, 713-5. The sepals of this variety are creamy-yellow, heavily blotched with claret, and are 2 inches wide, the petals three-quarters of an inch across, barred and blotched with deeper claret. It is one of Messrs. Low's introductions, sent to them from Xalapa in Mexico about the year 1835. It is well figured in the *Botanical Register* in 1839, and also six years later in the *Botanical Magazine*, where it is stated that the powerful fragrance this species exhales scents the whole stove—the perfume resembling a mixture of Melon and Vanilla. There is also a splendid figure of it in Bateman's *Orchid. Mex. et Guatem.*, t. 7.

*S. Wardii*, also grown here, is a charming species, deliciously scented; it is well known in collections, and forms a long spike of rich yellow flowers, spotted, reddish-purple. It is figured in Lindley's *Sertum*, and in the *Botanical Magazine*, t. 5289; and the editor states, that "one of the most striking features of this flower is the colour of the cavity formed at

the base of the lip, lined as it were with dark velvety purple, reflecting a silvery light, and giving to it the appearance of being frosted."

*S. grandiflora* I have not seen in flower; it is not figured anywhere, except in the *Botanist* (Maudslayi). The flowers are white, lightly dotted crimson, and also sweetly scented. There is also an excellent example of *S. insignis*; this is not only an interesting species, and very beautiful in itself, but on it the genus was founded by Sir William Hooker, when Professor of Botany in the University of Glasgow in 1829, in honour of the Right Hon. Philip Henry, Earl Stanhope. *S. grandiflora* was introduced two years before this, but was grown under the name of *Ceratocylus grandiflorus*. Twenty years ago I grew a plant of this species 2 feet across the mass of pseudobulbs. The flowers are of large size, and very fragrant. *S. oculata* is also well worth space in a select collection; I grew it into an immense plant some years ago, and can vouch for its easy culture. Like the last-named, it was grown and figured by Loddiges in the *Botanical Cabinet*, under the name of *Ceratocylus oculatus*. It produces a long spike of waxy-white or pale yellow flowers, the sepals spotted lilac-purple. One spike will scent a house with its fragrance.

Mr. Horner has not yet added the singular-looking *S. Bucephalus* to his collection, but it should have place where six species are grown. The rich deep yellow flowers, powerfully fragrant also, are distinctly marked with large blood-coloured spots. It is a native of Ecuador, and is well figured in *Bot. Mag.*, t. 5278.

Mr. Horner has several new species to flower, one from the Roraima district, and if they are as good as the few I have named they will be well worth growing. I would, at any rate, urge amateurs to include such distinct and handsome Orchids as the Stanhopeas in their collections. Those I have named are probably the best of them. *J. Douglas.*

## SCOTLAND.

### A NEW FORM OF POTATO DISEASE.

CONSIDERABLE interest has naturally been awakened in the North of Scotland by the report that a new form of Potato disease has this year been discovered. On the farm of Balmuchy, occupied by Mr. Gordon, the disease has appeared, and the shaws of a number of tubers have been sent to an expert in London, in order to get an opinion as to the nature and causes of the fungus. The disease, it appears, instead of beginning at the top of the plant, attacks the root and works upwards, devouring, it is stated, all the succulent parts of the stem. The spores of the fungus are said to resemble the ergot of Rye [1], and possibly investigation may result in the discovery that it is allied to it in character. As to the cause of it, of course only conjecture may be hazarded, but it is not at all improbable it may be connected with the nature of the past season. Potatoes are always of better quality in a dry season than in a wet, and it may be taken for granted that the long prevalent moist weather rendered the plant less robust and more easily susceptible of attack. In these circumstances it may be found that the disease is not one that is likely soon to re-appear again, unless, indeed, the conditions which gave it birth reappear also. *W. K.*

### ROYAL HORTICULTURAL SOCIETY OF ABERDEEN.

The annual meeting of the members of this Society was held in the Music Hall Buildings, Aberdeen, on Saturday evening, 13th inst. There was a large attendance, and Councillor Lyon, chairman of the acting directors, occupied the chair. In moving the adoption of the report, which stated that the receipts for the season have amounted to £456 14s. 8d., and the payments to £348 18s. 6d., leaving a surplus of £107 15s. 9d., which, added to £1 3s. 7d. brought from last account, leaves a sum of £108 19s. 4d. at the credit of the Society.

## WOOLHOPE FUNGUS FORAY.

ON Monday evening, October 1, the visitors slowly concentrated themselves at the Speeche House, Coleford, in the Forest of Dean, and were met in the morning in the forest, or afterwards at the hotel, by the Hereford contingent. Cold it might be, for some of the party swept the snow from the grass into their hands at about 10 a.m., but it was clear and bright. As for the fungi, truly they were few and far between, the oldest excursions venturing the opinion that it was the worst prospect of a fungus foray which the Woolhope Club ever experienced, bad as it was in the previous year. The ground was moist enough, it is true, but so cold, that only on the sunniest slopes could the commonest of species be found, and even these were scarce and scattered. Whether in anticipation of such a result, or from a combination of various circumstances, the company was much smaller than usual. It included Messrs. T. B. Acton, C. Backnall, Dr. Carlyle, M. C. Cooke, T. Howse, W. Phillips, Rev. J. E. Vize, and H. T. Wharton, in addition to the President, the President elect, and a few old Woolhoppers, under the guidance of the indefatigable H. C. Moore. The Tuesday's excursion by the Speeche House party was made in a circuit at some distance from the hotel, the other moiety proceeding to Danby Beeches, and thence by Blackpool Bridge (where remains of the paving of the old Roman road may be distinctly traced), and for 2 miles along the Spruce Fir ride. No record was kept of the species observed, but nearly everything in moderately good condition found its way into the collecting baskets, and yet they were not full. Rareties and novelties were out of the question, and never, perhaps, were common species treated with so much care and consideration. Even *Agaricus melleus* and *A. fascicularis* were treated with respect; one gentleman actually took off his hat in the presence of almost the only specimen of *A. rubescens* encountered in the Forest. Last year *Cantharellus aurantiacus* was one of the commonest species, sometimes growing by hundreds, but this year not a single one could be found. There was no dearth of walking—naught but walking "on, on, for ever"—to stoop and pick up a fungus was an event, but, alas! it was seldom worth the trouble of stooping. It was worthy of note, that although the large genus *Agaricus* contains some 700 British species, the number seen was singularly few, the proportion being very far less than in most other genera, whilst, in the number of individuals, *Lactarius* and *Russula* exceeded it. *Coprinus* was seen but once or twice, and all the species of *Cortinarius* were extremely rare. Dinner at the Speeche House Hotel, and a careful scrutiny of all the baskets, with the inevitable "nightsaps" ended the first day. On the Wednesday the members proceeded by train to Park End, which proved so satisfactory last year; but here again they were doomed to disappointment, for although more prolific than any spot visited on the Tuesday, yet the best was very bad, nothing of interest being found except some very fine specimens of *Russula integra*, and a few *Hygrophori*. Strolling slowly back through devious ways to Speeche House, soon after 2 o'clock, light refreshment and waggons carried the party a drive of 8 miles to Newnham Station for Hereford, and completed the two memorable days of fungus hunting in the Forest of Dean. Like the bears of the forest, in another corner of Europe, the fungi had retreated to the mountains, and would not be found. Thursday, being the Club day was devoted to a little excursion in the woods and lawns of Holme Lacy, where Bracken flourished in luxurious profusion, but fungi were more scarce than in the Forest of Dean, although that was a contingency never anticipated. How it could be possible, October for any wooded locality to be worse than the Forest was not credited, but such was the summary of results. Dinner, as usual, at the "Green Dragon" Hotel, was followed by some remarks by Dr. M. C. Cooke on "The Mycology of 1887-1888," with a

summary of the books, and local lists published during the year, with new species which had for the first time been found in this country, including *Lactarius aurantiacus* in Epping Forest. *Agaricus* (*Omphalia*) *chrysophyllus* in Scotland, *Russula puellaris* and *R. roseipes* near Morpeth; *Russula Barlos* and *R. granulosa* at Kew; *Russula maculata* and *R. armeniaca* at Epping; with *Hygrophorus spadiceus* from Crum Forest, and *Agaricus* (*Hypholoma*) *catarius* from Kew and the Forest of Dean; and lastly, the singular appearance of *Mutinus bambusinus* at Sunningdale. A comparison was also instituted between the meagre results of the present year's Woolhope excursions and the unusually successful excursion recently made in Epping Forest, but no clue could be given to the causes of such divergence, which, like some other

until he touched them did not discover his mistake. The social aspect of the week was a pleasant reminiscence, but the scientific phase undoubtedly a deplorable failure. *M. C. C.*

## TREES AND SHRUBS.

### PTEROCARYA FRAXINIFOLIA.

At p. 380 of your issue of the 6th inst. I notice your remarks in reference to *Pterocarya fraxinifolia*. Just now the trees here present a very beautiful appearance, and where the climate will admit of it I consider it a worthy subject to plant in groups with other choice trees and shrubs. Our trees range from 20 to 33 feet high; one grow-

roots of a tree that was blown down in 1883, we have two trees, both of which fruit freely. One of these is 50 feet high, but is not so fine as the one that was blown down. The two finest have grown beside a small stream, and to this, I suppose, must be attributed their fine development, though the third, quite away from any water, has made good growth. The mass of growth above referred to bears leaves very nearly 2 feet long and over a foot across. *R. Irwin Lynch.*

### RHUS COTINUS.

Among shrubs in the autumn season this is one of the most ornamental, as its highly coloured inflorescence is very attractive; but to have it and see it at its best, plants must stand where they can have full light and sun, as it is those agents that give the rich deep tinge to the bloom. When it has this it is of great value for table decoration, as the lovely feathery sprays show up in fine contrast with the cloth, and form an excellent basis for any white or pale flowers to be mixed in with the *Rhus*. As a plant for prominent positions on lawns, or the foreground of shrubbery borders, the *Rhus cotinus* is quite unrivalled, and those who have not specimens of it should make a point of planting a few bushes, the best time for doing this being in November, or as soon as the leaves fall, when all deciduous subjects move without much check, as they have all the winter months to be forming fresh roots. The way to propagate *Rhus cotinus* is by cuttings of the young ripened shoots, which strike readily if taken off with a heel and dibbled in sandy soil in any sheltered spot, and there covered with a hand-light to keep them close till they callus. *J. S.*

## THE CHEMISTRY OF VEGETATION, IN REFERENCE TO THE GROWTH OF THE POTATO.

(Continued from p. 326.)

A new line of research, which led to very important results, was brought about in a curious way. One evening Charles X.'s guests, at a *soirée* at the Tuileries, were effected with uncontrollable fits of coughing. An inquiry as to the condition of the air that caused this was ordered, and it was entrusted to Brongnart, director of the Royal porcelain manufactory, at Sèvres, who handed it over to his son-in-law, Dumas, a chemist who was rising to wide reputation. Most people probably know that chlorine is used for bleaching, and that it has a very suffocating odour. Dumas found that chlorine had been employed for bleaching the candles that were used in such large numbers to illuminate the brilliant salons. His investigation as to why the chlorine was retained in the candles led him to the discovery, that the chlorine had "substituted the place," chemically, of some of the hydrogen of the wax hydro-carbon, and that the amount of chlorine "fixed" was exactly equivalent to the amount of hydrogen eliminated.

From this hint he extended his inquiries to changes that may occur in other compounds, and arrived at what was known as the law of substitutions,\* and this he later developed into a theory of chemical types. The theory was that certain compounds were constructed on a certain plan or type, and with it was expressed the belief that one "element" may entirely replace another without the type of the construction being altered. This was in 1839.

Gerhardt, of Strasburg, who lived only forty years (1816-1856), and at Leipzig, attended rather to chemistry than learning the business for which his father intended him, enlisted in a cavalry regiment, and was bought off to study under Liebig, at Giessen, eventually threw much of his energies into the subject of conflicting chemical theories. He gave much thought to the question of types, and it was chiefly through him and his fellow worker, Laurent, that there came the explanations which

FIG. 69.—*STANHOPEA TIGRINA*. (SEE P. 480.)

phenomena associated with fungi, "no fellow can understand." The usual *soirée* at the residence of Mr. Cam was largely attended in the evening, the papers read being "On Dr. Bull's *Birds of Herefordshire*," by H. T. Wharton, M.A., F.Z.S.; "Notes and Queries on *Russula*," by M. C. Cooke; and "On Spiders," by the Rev. J. E. Vize, M.A. The final excursion on Friday, October 5, was made by train to Pontrilas, thence by carriages to Kentchurch Park, returning to luncheon at 3 P.M. with Mr. and Mrs. Matthews at Pontrilas. This latter experiment gave immense satisfaction at the close of a barren week; the genial hospitality extended to the excursionists compelling them to forget the immediate past in the enjoyment of the present. The lawn was decorated by clever models of various fungi, painted by the hostess in such excellent style that one of the excursionists rushed upon them with his basket, and

ing near the margin of a lake has taken the form of a bush, and covers an area of 400 square feet. The bold yellow Walnut-like foliage, and the long pale green catkins make the tree a very pleasing object in garden landscape. Two plants growing on higher and drier ground have run up with clean stems of 8 feet in height, and then branch off into a head; the diameter of the thickest stem at 1 foot from the ground is 12 inches; the bark has much resemblance to that of the Walnut, to which it is closely allied. I send you specimens for your inspection. *D. Crombie, Gardener, Powerscourt, Ireland.*

This beautiful tree, illustrated recently at p. 381, is referred to in the accompanying paragraph as seldom producing the female catkins, and therefore some information of the trees at Cambridge may be of interest. Besides an immense mass, measuring 45 feet across and 20 feet high in the centre, grown up from the

have made it possible to arrange certain organic compounds on the types of some of the simple inorganic bodies.

One very important suggestion he made was that the weights then usually assigned to oxygen, sulphur, and carbon, ought to be taken just double. This helped to clear up many apparent anomalies. For example, where it was formerly supposed that in a compound there were two atoms of oxygen each with the weight (relative to hydrogen) of 8, he suggested one of 16; carbon would be 12 instead of 6, and sulphur 32 instead of 16.

In this rapid historic retrospect much important work has been purposely passed over. The paper would otherwise be too long.

My aim has been only to draw the attention of cultivators to the kind of way in which, during the fifty years following the circulation of Dalton's first table, our chemistry has come to be what it is; that is, so far as measuring by volume and weight are concerned; for this, with temperature observations, is at the bottom of chemistry.

But this is not all; especially it is not all in reference to plant life.

There are compounds which, so far as the relative proportions of the weights of their constituent elements go, appear identical. Their "chemical composition" is the same, yet in certain physical ways they behave differently; it cannot, therefore, be assumed they are absolutely identical.

Leaving for the present the different names that have been proposed for these phenomena, let us consider one that has a bearing on starch and sugar.

It has been just mentioned that there are certain recognised types among compounds. It is not only a matter of convenience, but it seems to accord with the facts of Nature, that these can be thrown into groups, classes, series, or "families." (The use of these terms by chemists is unfortunately by no means uniform any more than is the use of alliance, group, sub-order, &c., among botanists.) One class or family all-important to the student of plant-life is that of the carbo-hydrates. Here the hydrogen and the oxygen (Lindley's *Introd.*) are present in the *proportion* in which they form water, i.e.—

$H_2, O_2$ , or  $H_2, O_2$ , or  $H_2, O_2$ , retain the same *proportion*, just double the number of H atoms compared with the number of O.

Of these carbo-hydrates there are three groups, to which are given the names glucoses, saccharons, and amyloids (some use glucoses, sucroses and amyloses). They differ only in the relative amount of  $(H)-(O)-(H)$  they contain.

Glucoses	...	C	six	
	H	twelve	...	12
Saccharons	...	O	six	...
	C	twelve	...	6
Amyloids	...	H	twenty-two	...
	O	eleven	...	11
	...	C	six	...
	H	ten	...	10
	...	O	five	...
			...	5

(Or some multiple of six, ten and five, as e.g., twenty-four, forty and twenty; in any case the H atom is double the O.)

Now the point here to notice is that a glucose becomes a saccharon by the addition of H two, O one (there is hardly space to put the requisite number of circles in a column of this width), or an amyloid by the subtraction of H two, O one. Slight though this difference may appear to those not accustomed to think of these matters, it completely changes the character of the compound in many respects.

For example, every one knows the difference in taste between starch, which is an amyloid, and Grape sugar, which is a glucose. What is the explanation of our sensations of taste and smell we do not at all know. But we possess them and trust to them. Taste tells us there is some difference between starch and sugar. In the process of digestion we transform starch to sugar.

The "acids" which are found in various fruits have a chemical relationship not far removed from one another. For example, there is in Apples, Pears, and Rhubarb, &c., an acid called malic—

In Grapes, Pine-apples, &c., an acid called tartaric—

In Lemons, Gooseberries, Currants, &c., an acid called citric—

Yet a trained palate readily tells the difference in flavour. The change of flavour in the ripening of fruits much depends on a slight relative difference of the H and O present in each molecule.

That the difference of one O in a compound has in some cases most important influence may be illustrated by the difference  $CO$  and  $CO_2$ .

We breathe out  $CO_2$ , candles and lamps give it off, and if we sit in a badly ventilated room we feel uncomfortable. But  $CO_2$  is not "poisonous" to us, while  $CO$  is. A charcoal-pan in a room with no ventilation has been not infrequently used as an "end to the troubles of life." Again, plants can decompose  $CO_2$ , but not  $CO$ .

This apparently slight chemical difference between starch and sugar is accompanied by another. Sugar is soluble in cold water, starch is not. There is another known difference among the carbo-hydrates, to be mentioned immediately. A moment's consideration of the close connection between starch and sugar will show its bearings on the question of tuber formation. Starch is formed in the leaf, and it is a transient compound. (The recent work on this subject will be spoken of later.) Starch accumulates in the tuber in the form of granules; but it has been said to be not found in the stem. How does it get from the leaf to the stem?

Some cultivators and Potato dealers have spoken to me incredulously about the conversion of starch into sugar. I verily believe they have pictured to themselves some such kind of thing as a pound of starch neatly tied up to go home for stiffening frills and lace, and that no "Heigh, presto! quick, change!" could make it possible to find a pound of lump sugar on undoing the parcel. At any rate the notion of starch and sugar seems limited to the form in which they are in the habit of seeing them.

Now it is necessary to keep in mind the difference between a starch molecule, a starch cell, and a starch grain or granule.

From what has been said above about the size of atoms, it will be understood that a starch molecule formed of a group of atoms is *utterly* beyond the range of vision even with our highest microscopes. A vegetable cell is a visible object, and a starch cell simply means one that contains starch, or in which starch is being formed, not necessarily one "made up" wholly of starch. Granule or grain is used for the accumulated starch. W. S. M.

(To be continued.)

## PLANT PORTRAITS.

BILBERGIA BREANTEANA  $\times$ , Andr , *Gartenflora*, October.—A cross out of B. vittata by B. pallescens, with oblong, obtuse, dentate leaves and pendulous panicles of flowers, with oblong, crimson bracts and elongate blue flowers.

CORNUS STOLONIFERA, *Revue Horticole*, October 1.—Leaves oblong-lanceolate, paler beneath, berries blue.

MESOSPIDIUM VULCANICUM, *Revue de l'Horticulture Belge*, October.

## HAMPSHIRE FIELD CLUB FUNGUS FORAY.

The expanse of the New Forest is almost unknown to the predacious fungus hunter; until very lately it has never been thought about, and now the one element wanting is a local enthusiast who will set himself to work in good earnest to ascertain what treasures of fungi the New Forest region will furnish. It is all very well to have a day or two set apart once a year, and to invite down a few of those who love the sport, for a fungus hunt, but all the rest of the year is forgotten, and in this way the fungi of the Forest will not be explored till Doomsday. What a glorious spot for anyone devoted to the study to settle down upon in August, and keep it up till October, hunting in all directions day by day, over miles of wooded country, genuine forest and plantation, sketching away all the juicy days, and tramping all the dry ones! And what a budget of treasures he might hope to find for the delectation and astonishment of those who consume the autumn lolling on the beach, and throwing pebbles in the sea. Last year the Hampshire Field Club, at the instigation of the Rev. W. L. Eyre, of Swarrator, made their first effort at organising a fungus excursion in the Forest, and this year it was repeated, with still greater success. Although the crop of fungi was far richer than in the Forest of Dean, it was by no means equal to what it has been in some previous years, whilst better than last year. In 1887 only about 106 species were collected and recorded during the two days, but in 1888 no less than 171 species were determined, and of these sixty-eight species found last year were found again this year, whilst thirty-eight of those found last year were not seen this year at all. The first day's excursion (on Thursday, October 11), was made in Boldrewood, and Knightwood, or on the way thither, the Rev. W. L. Eyre and M. C. Cooke undertaking the determination and record of the species. The majority of the excursionists were interested chiefly in the esculent qualities of the "Toadstools" found. Not a Mushroom was seen, and all the specimens of *Lactarius deliciosus* were shrivelled and dried up, but *Hydnum repandum* was plentiful, and there were a few of the *Chantarelle*. Some of the most interesting to the novices were two or three large clumps of *Polyporus imbricatus*, the little *Hydnum auriscalpium* in profusion, the jelly-like *Tremellodon gelatinosum*, the Club of Hercules, *Clavaria pistillaris*, very large tufts of *Clavaria aurea*, *Cortinarius sanguineus*, and the delicate *Cortinarius albo-violaceus*; *Lactarius cyathula*, a rare species, found under Birch trees; and a very great quantity of very fine specimens of *Agaricus* (*Tricholoma*) *imbricatus*. At the close of the day the party returned to Southampton, when a meeting was held in the evening at the Hartley Institution, and the specimens collected during the day were displayed on the tables, and for about an hour Dr. M. C. Cooke demonstrated to the audience chiefly from the edible and poisonous species on the tables. The following day (Friday) was again devoted to the Forest, starting on foot from the Lyndhurst Road Station, through an enclosure, and thence following a stream towards Minstead. About fifty additional species were found on the second day, together with many of those recorded on the first. The first hour or two were spent in Fir plantations, where the species were comparatively few in number, but the individuals were numerous; *Russula exalens* everywhere, but it seems doubtful whether it is any more than a variety of the sulphur-gilled *Russula drimeia*. It was here that the *Tremellodon gelatinosum* was found. Dr. Quelet recommends this species as delicious if eaten raw, with a little sherry, after the manner of calf's foot jelly. Two or three specimens of *Coprinus picaceus* were collected during the two days, dripping with inky juice, and this led to the discussion of the proposal which has been made for the printing of bank-notes with the juice of *Coprinus*, that fluid consisting of spores of a definite size and form, can at any time be

detected by the microscope, and distinguished from the inorganic material of which printing ink is composed. The excursions were, on the whole, entirely successful, and a source of mingled astonishment and pleasure to those who had thus made their first experiment in fungus hunting. One of these was induced to taste a morsel of the biting *Lactarius rufus*, and found spitting a relief for some time afterwards. Others made a more pleasant and successful experiment with the Hedgehog Mushroom, *Hydnum repandum*, cutting it in slices and eating with their sandwiches, the prevailing opinion being that it was a decided improvement. The two days were mild, sunny, and thoroughly enjoyable; in fact, they were two as genial autumnal days as any fungus-hunter could desire. *M. C. C.*

## HOME CORRESPONDENCE.

 Correspondents will greatly oblige by sending early intelligence of local events likely to be of interest to our readers, or of any matters which it is desirable to bring under the notice of horticulturists.

Photographs or drawings of gardens, or of remarkable plants, trees, &c., are also solicited.

**HARDY HYBRID CRINUM POWELLI AND ITS VARIETIES.**—This really beautiful and free-blooming perfectly hardy plant has been very fine in my garden this summer, and has excited the admiration of every one who has seen it. I planted one strong bulb when it was first sent by Messrs. Henderson (I cannot exactly say how many years ago, but think it must be about seven or eight), and this has been left undisturbed in my garden border ever since, and has now increased into a clump of from ten to twelve strong bulbs, which sent up this summer no less than eighteen fine tall flower-spikes averaging 4 feet in height, though some of them were an inch or two taller, and each bearing a bunch of from twelve to sixteen beautiful deep rose-coloured flowers much more tubular than those of its parent *C. Moorei*, and closely resembling those of a *Belladonna*, only larger in size, and a brighter shade of colour. Whether the slugs have got tired of them or not I cannot say; but whereas in former years they used to browse almost nightly on the buds just as they were on the point of opening, this year, to my great satisfaction, they did not come near them. Of the other two varieties of this race of hybrids one may be called intermedium for distinction's sake, as it is of a much paler shade of pink than the type form, and though not so fully opened, is a more perfectly formed and evenly beautiful flower. Its stems also do not rise nearly so high, seldom exceeding from 2½ to 3 feet in height. Though I have quite as fine a stock of this variety, which I broke up and replanted two years ago, and which bloomed nicely for me last year, this year, for reasons quite unknown to me, it did not produce a single flower-spike, though its foliage was almost as healthy and vigorous as the others. The third variety, *C. Powellii album*, is, I think, quite one of the most beautiful hardy bulbs with which I am acquainted, as its shade of colour is so absolutely pure and free from any shade or tint of colour that it leaves nothing to desire. The form of its flowers has also the same evenness of perfection as exists in the pink variety, which it also resembles in its moderate height of flower-stem of about 2½ feet. It is unfortunately still very scarce, and commands a high price at the nurseries. My one bulb produced two fine spikes, each bearing from twelve to fourteen fine flowers, which were much admired. *W. E. Gumbleton.*

**THE HAY CROP.**—The favourable growing period experienced since the harvesting of the first crop of hay has induced a larger growth of aftermath than is usual in our meadows, and although the number of working hours when hay could be made, has necessarily been few, yet the splendid, bright, mid-day sun of the present autumn has enabled much second-crop hay of good quality to be secured. Sir J. B. Lawes' twenty-four experimental grass-plots at Rothamsted, have yielded very variable quantities of aftermath, in accordance with their varying manurial supply, but in some cases as much as 3 tons of second-crop hay per acre has been obtained. And as the present season was unfavourable for the development of stem-growth and seed formation in the

first-crop, we find a correspondingly larger proportion of flowering stems sent up by the aftermath. This was more especially the case with *Avena elatior* (Oat-like grass), and *Holcus lanatus* (soft woolly grass), and among several of the Composite species of the weedy plants. *J. J. Willis, Harpenden.*

**HELIANTHUS LÆTILORUS.**—In order that an obvious error in plant names may not be perpetrated, I am troubling you with a note. "C. S." tells us on p. 417 that "the Floral Committee evidently adopted the nomenclature of the Kew authority in preference to the name given by the Rev. Wolley Dod." But who is this authority who says that a plant which *Asa Gray* in September, 1887, named for Mr. W. Thompson, of Ipswich, *Helianthus lætiflorus*, is now to be called *Helianthus rigidus* semipalmatum? Surely the authority of *Asa Gray*, who spent a great part of a long life in studying North American Composites, is not already superseded in that class? Of the identity of the species I have no doubt. The plants I am now distributing, some of which I gave to Mr. Ware, are part of the same stock from which the specimen was sent to *Asa Gray*, when last in England, and my plants answer to his description in every character (see *Flora of North America*, vol. i., part 2, p. 276). *H. lætiflorus* has the disc yellow, not dark purple; it resembles tall forms of *H. rigidus*; it has the leaves thinner and more acuminate at both ends; it has the bracts of the involucre lanceolate attenuate acute, not ovate obtuse; they are imbricated in only two or three series, not pluri-serially. These are *Asa Gray's* characters of *H. lætiflorus* contrasted with those of *H. rigidus*, and when compared by these, the plants may be readily distinguished. There are other differences not mentioned by *Asa Gray*. The young buds of *H. lætiflorus* have the disc quite covered by the bracts, the points of which meet in the centre, while those of *H. rigidus* have the centre of the disc uncovered. The outer bracts of *H. lætiflorus* are often spreading, whilst all the bracts of *H. rigidus* are adpressed. The leaves of *H. lætiflorus* are all more or less distinctly petioled, but those of *H. rigidus* are nearly or quite sessile. *C. Wolley Dod, Edgely Hall, Malpas.*

**POTATO WORTHINGTON SMITH: REVERSION TO ORIGINAL.**—Amongst the Potatoes in the collection of Messrs. Sutton & Sons, of Reading, is one named Worthington Smith, raised about eighteen years ago, a cross between Early Coldstream and old Early Ashleaf. All the tubers produced by the cross were kidneys except one example—a distinct round, and this was preserved and named Worthington Smith. By the courtesy of Messrs. Sutton I have been allowed to grow this excellent early round Potato for the last four seasons, and the characters of all the examples planted have hitherto been quite permanent, the globular form being always very marked. A single plant has this year reverted and produced all true kidneys instead of round Potatoes. *W. G. S.*

**REMOVING THE HAULM OF POTATOS.**—If as the question of removing the haulm been worked out? Some few years ago it was advised (I believe in the *Gardeners' Chronicle*) to remove the haulm on or before the appearance of disease; and by this simple plan the crop would certainly be secured. In consequence of the garden here being wet and cold, and the soil a tenacious clay, the growth of late Potatoes was long since abandoned. My remarks, therefore, refer only to early and mid-season varieties. Before disease has made any great advance the tops are drawn clean out by hand, without disturbing the tubers, which is effected by the men placing their feet on each side of the haulm. The Potatoes are then left for the skins to get set before lifting, which may be done at the convenience of the grower. They will never take the disease so badly without the haulm as if that be left on them. I drew the top of Veitch's Ashleaf about the third week in July; of Beauty of Hebron and Early Rose the last week in that month; of Vicar of Laleham in the first week in August. By the time the disease became general I had not a leaf or stem of Potato in the garden, but the crops when taken up consisted of fair-sized tubers. Early pulling of the haulm enables the gardener to put in his winter Kales, Savoy, Broccoli, &c., between the Potato rows in good time. My neighbours predicted that the Potatoes would not keep well, some thinking they would take the disease, but they are at present all right. I must admit that a few are rotten—perhaps 1 per cent. I attribute this to the fact that some of them were growing, or rather lying in a saturated soil for some time before

they were lifted. On p. 274 it is stated that the farmers in Lincolnshire have good crops of Potatoes, also that many of them cut off the haulm: perhaps their success may be due to this practice. *Geo. Wall, Breakspears, Usbridge.*

**DISEASE RESISTING POTATOS: THE TRUE REMEDY.**—Probably on no other subject of equal importance can so many and so diverse views be propounded, with the chance that—like the colour of the chameleon—"all may be right and all may be wrong." What might have been right last year—one of the driest seasons on record—would indubitably be quite wrong this year—one of the wettest, during the critical months of June, July, and August, for this crop. This applies to varieties, too; so I quite agree with Mr. A. Dean (p. 302), that it may be injudicious to invite opinions as to what kinds resisted disease best. Having so frequently intruded on your columns on this subject—it is of vital importance in Ireland—I will avoid reiteration, and give my experience to prove the fact that other circumstances than "variety" must be considered. I had about thirty varieties from Messrs. Sutton, Carter, Laxton, and others, most of them not yet in commerce, in an experimental plot. Among the number was Sutton's Abundance—probably one of the most vigorous growers and heavy croppers in existence—three out of ten received from Mr. Laxton, of Bedford, are similar, and the same vigour and prolific qualities apply to Carter's King of the Russets, Scottish Queen, and, of course, to the well-known Champion. The soil of the plot was rich, but I added some stable manure when planting, and I had also the misfortune to plant a couple of drills of Inglis' White Fortyfold, Victorias, and Regents. Most people know those varieties are very prone to disease in a moist season. Those varieties got diseased after the Ashleaf Kidneys, and in a few days every leaf was affected, and then the stems. The disease rapidly spread to the aforementioned (customary) disease resisters, and they offered practically no resistance to the progress of the disease. When dug up, not a tuber of the Fortyfold was sound, and the Victorias were not much better. Abundance, which had enormous stalks and foliage, and which was perfectly free from disease last year, had 60 per cent. of the tubers rotten; and other reputed disease resisters were similarly affected. Now, let us examine the field crop. In this field there were many of the foregoing varieties also, but the largest breathers were under Hero, Magnum Bonum, Scottish Queen, Beauty of Hebron, and Scotch Champion. I have lifted roots here, and there of those, and up to the present—though the stalks were diseased and withered more than a month since—I have found but one diseased tuber. This is, to my mind, very remarkable and suggestive. There is hardly any difference of soil or situation between the experimental plot and the farm, and, as I said, the same varieties badly diseased in the former are almost wholly free in the latter. I attribute this result to a considerable extent to two causes:—1. Owing to an alteration I had to make in my rotation of crops, the farm Potatoes followed a manured Turnip crop—very unusual; but owing to the persistent drought last year, I had hardly any Turnips; instead, therefore, of manuring the same field two years in succession, I had about a thousand loads of compost—a considerable fraction of which was lime—and this I used for the Potatoes, with the consequence of almost complete immunity from Potato disease. This result seems exactly to confirm Mr. A. Dean's statement (p. 302, *Gardeners' Chronicle*):—"As is usually the case, the worst evidences of disease are found in the highly manured soils." 2. The bad results in the aforementioned experimental plot I consider partly owing to the manuring, but still more to the fact that this same plot has been (owing to convenience) used for Potatoes several years successively, and it is more than likely the spores of disease remained in the soil awaiting only favourable circumstances to reappear, moisture being an indispensable agent. From this it may be inferred that when manure is used for the Potato crop it should be specially prepared, and, if of rich quality, largely mixed with lime, loam, &c., to avert in a measure too luxuriant sap growth. Another recommendation—and that I have called the "true remedy"—struck me lately when visiting Messrs. Dickson's, of Newtownards and Belfast, and a large Potato grower in Scotland. It is now a month since, and both had considerable stocks of Potatoes then saved, that is, they lifted and stored them the second week in August. They found, as most growers will, that such varieties as Beauty of

Hebron, Second Early, Dickson's Northern Queen (put in commerce, I believe, this year), and in Scotland The Don, are ripe and with the skin "set" at that time; and they find, moreover, that disease has not reached the tubers. I asked Messrs. Dickson if they lost any by storing thus early, and I was assured that none were lost. Well, then, if we can grow any second early variety that can be lifted and stored before disease can seriously affect them, are we not on the right road to defy the disease? I submit this point has not received as much attention as its importance merits. *W. J. Murphy, Clonmel, September 11.*

**LATE FLOWERING ICELAND POPPIES.**—All lovers of hardy flowers are well acquainted with the beauty of the Iceland Poppies and I am pleased to observe that they are getting as popular as the Canterbury Bells and Wallflowers. Indeed these charming Poppies should be largely grown where cut flowers are wanted for indoor decoration. I have now before me some slender specimen glasses loosely arranged with bud and flowers, ranging from the purest satiny-white and yellow to the deepest glowing orange-scarlet. What can be more beautiful than an arrangement of these elegant Poppies in various shades with their own buds and foliage? I enclose a few blooms, just to give you an idea how splendid these Poppies are, which, notwithstanding the fact that the flower season is over and all their companions completely destroyed by the recent sharp frost, are still making a grand show. *C. S.*

**IRISH YEW.**—We have a large upright Yew tree here, it is in perfect health; the height is 53 feet, and the circumference at 15 feet from ground 55 feet. I enclose a small photo of it, and should like to know if there are many in the country larger. *Wm. Allen, Seaford, Clough, co. Down.*

**THE FERNS AT THE RECENT MEETING OF THE ROYAL HORTICULTURAL SOCIETY.**—The group of Ferns shown by Mr. H. B. May, of Upper Edmonton, on October 9, numbered upwards of 200 species and varieties, and generally stood several plants together in one pan to show off the characteristics of the species or variety better than single plants would do. Of *Adiantums* there were from forty to fifty different varieties, including several that were new and beautiful, viz., *A. elegans*, which resembles *A. cucumatum*, but has a rather larger frond, with long stipes. It is likely to become a very popular market plant, and is especially good for cutting. Several of the market growers have already commenced growing it in preference to *A. cucumatum*. *A. fragrantissimum* is another beautiful form. *A. Williamsii*, now a favourite for cut fronds, the pale green colour being much appreciated. *A. mundulum*, *A. Pacotii*, and *A. Legrandii*, dwarf compact varieties—distinct and valuable. *A. Regine* is a very fine variety, intermediate between *A. Victoria* and *A. scutum*, and has the broad deep green pinnales of the former, and more of the habit of the latter; it forms a bold and effective plant. *A. cucumatum* grandiceps is a very prettily tasselled form, and *A. Veigandii* forms a pretty and compact plant. Among sorts remarkable for their brightly tinted foliage may be mentioned:—*A. Veitchii*, *A. tetraphyllum gracile*, a perfect gem, but rather scarce at the present time; *A. rhodophyllum*, *A. rubellum*, *A. macrophyllum* and its variety, *A. m. bipinnatum*, were also well shown. Of larger growing varieties, *A. pentadactylon*, *A. Sancta Catherine*, *A. trapeziforme* were conspicuous. *A. formosum* and *A. cardiocladia* may also be mentioned. *A. Farleyense* was shown in good condition, and the young fronds had the distinguishing bright pink tint. Several good varieties of *A. Capillus-veneris* were shown, including the beautiful *A. Raperi*, or *A. Mariessii*, as it is frequently named; *A. C.-v. magnificum*, *A. C.-v. daphnites*, *A. C.-v. cornubiense*, and the curious little *A. C.-v. fissum* were all worthy of notice. Before leaving this genus I must mention the pretty little *A. reniforme*, *A. curvatum*, *A. dolabriforme*, and *A. caudatum* (*A. Edgworthii*), two very pretty Ferns for baskets. *Aspleniums* were well represented, about eighteen sorts being shown, the most conspicuous being *A. laxum pumilum*, *A. cicutarium*, *A. formosum*, *A. neo-caledonicum*, *A. Belangerii*, *A. flaccidum*, *A. lucidum*, and several varieties of the *A. bulbiferum* type. The Cheilanthes were represented by good specimens of *C. elegans*, *C. hirta Ellisi*, and *C. tomentosa*. About a dozen species and varieties of *Davallias* were shown, the most conspicuous being *D. Mooreana*, a fine plant of which occupied the centre of the group; the beau-

tiful *D. fijiensis plumosa*, *D. elegans*, *D. tenuifolia Veitchii*, *D. feniculaeae*, *D. Griffithiana*, with conspicuous silvery-grey rhizomes and deep green foliages, may be regarded as one of the best of the genus; *D. Tyermanni*, another pretty species similar to the above but of smaller growth, and a fine variety of *D. canariensis*, were worthy of notice. Of *Lastreas* several beautiful species were shown; *L. aristata variegata*, *L. erythrosora*, remarkable for its bronzy-tinted fronds; *L. patens*, of graceful habit, and the pretty little *L. glabella*, were likewise worthy of note. Of *Gymnogrammas*, good forms of both the silver and golden varieties were observed; *G. Alstonii* was the most conspicuous of the latter. In this variety the under surface is covered heavily with bright yellow mealiness, and the pinnales are curled inwards at the extremities, showing off the under surface to much advantage. *G. perviana argyrophylla* was the best silver variety. Good crested forms were seen in *G. Parsonsii* (golden), and *G. Wettenthaliana* (silver). *Nephrolepis*, another beautiful genus, was well represented, and some fine seedling forms were remarked of *N. davallioides furcans*, *N. rufescens triplinatifida*, a recent addition to this genus, which should become a favourite; *N. Bausei*, another elegant variety; and *N. acuta*, a bold habited and effective Fern for baskets, and suspending generally; *N. Duffi*, *N. pectinata*, and several others were shown. Numerous beautiful species and varieties were shown of variegated *Pteris*, viz., *P. tricolor*, in beautiful condition; *P. aspericula*, remarkable for its deep bronzy hue; *P. argyrea*, *P. nemoralis variegata*, similar to the last named, but of dwarf habit, and the young fronds of a reddish hue; *P. cretica Mayii*, and the dwarf-crested variety of *P. albo-lineata*, which has often been alluded to, was seen in good form. The dwarf-crested form of *P. serrulata* (May's variety) was also good, as was the *Chiswick* variety of the major form. *P. umbrosa* (the true variety), *P. leptophylla*, *P. tremula*, and several pretty varieties of this useful Fern were included, besides many others. The other interesting genera exhibited were, *Anemidictyon phyllitidis*, a pretty little Fern, the fertile portion of the fronds standing up from the base of the fronds in flower-like fashion; *Osmunda palustris*, *Oncidium japonicum*, and the beautiful *Oncidium auratum* may be included among the most elegant of all Ferns; *Dictyogramma japonica variegata*, a pretty variegated Fern, with fronds of good substance; *Doryopteris palmata*, a good variety of *Lomaria gibba*, *Microlepia hirta cristata*, *Phelebidium glaucum* (*P. sporodocarpum* of some), was very pretty; *Actinopteris radiata*, a little gem with small Palm-like fronds; *Pellea rotundifolia* and *P. ternifolia* are also worthy of note. *Pteris*.

**TOMATOS RECOVERING FROM DISEASE.**—You will doubtless remember me writing to you some six weeks since *re Tomatos* diseased, and I sent you some of the foliage and fruit. You recommended pulling them out and burning them. I did not take your advice, but at once put some 4-inch hot-water pipes into the house and treated the plants for the disease; and I am pleased to say that they have recovered, and by this post I have sent you a sample of the fruit, which hang in clusters on the plants. *F. Case*. [The plants must have recovered in an unusual manner from the attack of *Peronospora lycoposideri* under the warmer treatment adopted to have produced such fine samples of fruits as those sent with the above note. *Ed.*]

**LONG-LIVED CUCUMBERS.**—Referring to my recent note anent the house of long-lived Cucumbers at Belton Park, it may, by way of reply to Mr. Froud (p. 447), be interesting to state that, if my memory does not deceive me, the plants referred to were, I was informed by Mr. Sage, the gardener, raised from seed and not from cuttings, as was your correspondent's. I certainly did express surprise, and justly so, for after visiting several gardens of repute during the past summer, it was the best house of Cucumbers I had seen, summer or rather spring-planted ones included. Thus it is obvious that to keep Cucumber plants in full bearing for more than a year is no mean performance, although Mr. Froud eclipses that by doubling the time, which reflects credit upon him as a grower of Cucumbers. Here, however, although it may be depressing from the point, the question arises, which is the most conducive to a lengthy period of fruitfulness—plants raised from seed or cuttings? Personally, I am in favour of the latter, and should always raise plants by that means. It is a simple matter to do—in fact, with the aid of a little bottom-heat nothing is

simpler to strike than a Cucumber plant. Although Mr. Froud proved his proficiency as a Cucumber grower by keeping them in perfect health and productiveness for the period of nearly two years, it by no means proves that it is an advisable plan to follow generally. *C. Collins*.

## SOCIETIES.

### ROYAL HORTICULTURAL.

OCTOBER 23.—The exhibits at the meeting held at the Drill Hall last Tuesday were extremely few, and made the smallest of the season, no large groups being shown by the nurseries. Messrs. J. Veitch & Son contributed a few plants; Messrs. W. Holmes, Mr. Stevens, and Mr. Owen Chrysanthemums; and an interesting hybrid Orchid came from Mr. Ballantine. Exhibits of fruits and vegetables were also few.

### Floral Committee.

Present: G. F. Wilson, Esq., in the chair, and Messrs. Shirley Hibberd, W. Goldring, H. Herbst, W. Bates, W. Holmes, R. Dean, C. Pitcher, J. Dominy, H. Ballantine, H. M. Follett, J. O'Brien, Rev. W. Wilks, E. Hill, T. Baines, G. Duffield, and J. Fraser.

A few plants and cut blooms of new and recent varieties of Chrysanthemums were shown by Mr. W. Holmes, Frampton Park Nurseries, Hackney. Lincoln's-Inn, a Japanese reflexed flower, pretty dull crimson-brown and yellow below; and Sunflower, a bright yellow large Japanese, were Certificated—the latter being a particularly pretty flower: the petals are rather narrow and of good length. He also had good specimens of Quintus, a lilac Japanese variety; Sabine, a light yellow Japanese Anemone; Nelson, lake; Japanese Anemone, and Feu de Bengale, a pale red-brown Japanese, the tips yellow, and making a large head.

Messrs. J. R. Pearson & Sons, Chilwell, Notts, showed good flowers of *C. Delmas*, dull brown-red, broad segments reflexed, and a plant of *Capucine*, with pale yellow-terra-cotta coloured flowers (Japanese), very pretty and effective, and which was noticed by the committee as a good early flowering decorative variety which it certainly seemed to be.

Blooms of Chrysanthemum Wagstaff (a good full white Japanese), and Edwin Molyneux, also Japanese, with broad curled petals, rich crimson-red, with dull yellow below were well shown by Mr. G. Stevens, Putney, S.W.

Mr. R. Owen, Castle Hill Nursery, Maidenhead, showed a stand of some very good blooms, Lincoln's Inn and Magicienne being the best. The latter is a bronzy-orange coloured Japanese of large size, and very attractive. Others were Miss Burgess, bright lilac Japanese; Mons. Ch. Souchet, like Lincoln's Inn, but brighter yellow below; Thomas Stevens, white, suffused with lilac—Japanese; and Comte Horace de Choiseuil, reflexed broad white segments.

Mr. H. Jackson, gr. to S. A. Ralli, Esq., had a large cluster of *Lapageria alba*; and from the garden of G. F. Wilson, Esq., there came a white form of *Primula capitata*.

Messrs. Seeger & Tropp, The Nurseries, East Dulwich, had a *Cyrtopodium* named *C. Seegerianum* X, stated to be a hybrid between *C. Spicerianum* and *C. hirsutissimum*. The dorsal sepal is almost round, white, with a deep lilac median line, and a few lines of the same colour on each side, greenish at the base. The petal, about 1½ inch long, slightly longer than the sepal, light brownish-green, with a dark line running through the centre, spotted at the base with brown-purple and hairy along the margin, the lip projects forwards, green at the bottom and lake-brown over the rest; stamens livid lilac.

Mr. E. Crook, gr. to G. H. Baxter, Esq., Hutton Park, Brentwood, had a very richly-coloured piece of *Odontoglossum Inseleyi* splendens, the spike bearing five large flowers. *Oncidium Mantinii* was also shown by the exhibitor, and again by Messrs. J. Veitch & Sons, Royal Exotic Nursery, Chelsea, S.W. The flower is of the crispum form, the lip being yellow, with several brown spots distributed irregularly on it; the two petals brown, with a yellow border, the sepals being brown.

Messrs. Veitch also contributed hybrid greenhouse *Rhododendrons*, Yellow Perfection bearing bright primrose-yellow coloured flowers (its parentage is *Teysmanni*), and Lord Wolsley, the latter being the seed-bearer. *Rhododendron Brunette* was also shown: It is pale Indian-yellow, tinted with red—very pretty—and has six or seven segments in the

corolla. They also had a plant of *Alocasia Chautrierei*, which has leaves about 12 inches long by 6 inches broad, with a wavy outline, dark green, with metallic white stripes running along the chief nerves.

A remarkable hybrid *Orchid* came from the gardens of Baron Schroder, The Dell, Egham (gr. Mr. Ballantine). It is the result of crossing *Cattleya citrina* and *C. intermedia*. The plant shows its hybrid origin in all its particulars; the pseudobulb is covered with a white skin as in *citrina*, but is longer and narrower than in that species. The habit and leaves are quite intermediate, and the flowers are drooping, but in colour are rosy-white, the lip being pale rose on the centre lobe, and possesses an aroma of *Roses*. The form of *C. intermedia* is discernible here, but the segments are closed inwards. The plant bore two flowers and is called *Lamberhurst* hybrid. *C. Harrisii*, a cross between *C. Mandelli* and *C. Leopoldi*, was also shown; the segments are lilac slightly veined, the lip white externally and folding over the column, the median lobe is of an intermediate form, fringed slightly, large for the flower and deep bright purple, and the side lobes are of the same colour. The bloom is of fair size and open.

From the Royal Gardens, Kew, there were fruits of the Snake Gourd (*Trichosanthes anguina*), a Chinese plant, and of the Tree Tomato (*Cyphomandra betacea*), illustrated by us in a former issue.

#### FIRST-CLASS CERTIFICATES.

*Chrysanthemum* Lincoln's Inn, from Mr. W. Holmes.

*Chrysanthemum* Sandflower, from Mr. W. Holmes.

*Chrysanthemum* Lincoln's Inn, from Mr. Owen.

*Chrysanthemum* Magicienne, from Mr. Owen.

*Chrysanthemum* Edwin Molyneux, from Mr. G. Stevens.

*Chrysanthemum* Capucine (as an early-flowering decorative variety), from Messrs. J. R. Pearson & Sons.

*Cattleya* Harrisii, from Baron Schroder.

*Cattleya* Lamberhurst Hybrid, from Baron Schroder.

*Oncidium* Mantinii, from Mr. E. Crook.

*Oncidium* Mantinii, from Messrs. J. Veitch & Sons.

*Rhododendron* Yellow Perfection, from Messrs. J. Veitch & Sons.

#### Fruit Committee.

Present: H. Veitch, Esq., in the chair; and Messrs. P. Crowley, G. W. Cummins, R. D. Blackmore, J. Willard, J. Smith, W. Denning, J. Cheal, P. Barr, and W. Marshall.

Mr. Cook, Farnborough Grange Gardens, Herts, staged a small collection of fruit in fair samples, the most noticeable being *Blenheim Orange*, *Barker's Seedling*, *Cox's Pomona* and *Alfriston*, Apples; *Doyenné du Comice*, *Conseiller de la Cour*, *Pitmain*, *Duchess*, and *Beurré Diel*, Pears; and *Coe's Golden Drop Plum*. A dish of very finely-coloured *Duchess Favourite* Apple was shown by Captain Terry, Shrubland, Walton-on-Thames; and four varieties of *Damsons* came from Mr. J. Smith, Mentmore Gardens, Leighton Buzzard; they were *Farleigh* and *Shropshire* (small fruits), and *Worcestershire* and *Prune* (large fruits).

Mr. Smyth, Basing Park Gardens, Alton, sent seedling Grapes; and Messrs. J. Carter & Co., High Holborn, had tubers of *Stachys tubifera*, to which attention is called elsewhere.

Potatoes were shown by Mr. W. Ellington, West Row Gardens, Mildenhall, and by Mr. A. Selby, Radcliffe-on-Trent, Notts—the latter staging very large and clean tubers of *Reading Giant*, *Sutton's Abundance*, and *Satisfaction*; while Mr. Ellington had a cross between *Vicar of Laleham* and *Schoolmaster*, which was named *Market Favourite*; it is wedge-shaped, and has a yellow skin, spotted and blotched with purple.

#### BIRMINGHAM GARDENERS' MUTUAL IMPROVEMENT ASSOCIATION.

At a largely-attended meeting of this Society, held at the Midland Institute on Tuesday evening, October 16, Mr. W. B. Latham, Curator of the Botanical Gardens, Edgbaston, occupying the chair.

Mr. G. Barnes, *Orchid* grower to C. Winn, Esq., The Uplands, Selby Oak, read a very instructive paper on the cultivation of the *Odontoglossum* and *Miltunia*. In building a house for the purpose of growing these lovely flowers, he specially recom-

mended the choice of a south aspect, with plenty of top and bottom ventilation and light which can be removed in the summer months. Abundance of piping is another essential point to be observed, so that the temperature can be maintained in severe weather without creating that dry choking atmosphere, so often the result of over-heated pipes. Apply a light shading and keep a moist atmosphere in the summer months, and by no means a dry one in the winter, but in watering care must be taken not to wet the young growths, likewise to give a little air at all times even in the severest of weather. Potting operations he recommended to be done at the end of the summer just as they are commencing to grow—August and beginning of September being the most suitable time, but it should not be done on hot dry days, rather choosing dull moist weather, and so avoid that drying of the roots which so often proves injurious to this class of plants; sphagnum cut about 2 inches long, and good sandy peat in equal proportions, being the best material for the purpose; the pots should be two-thirds filled with crocks, the plants potted firm, and care should be taken to avoid the young growths when watering; but in all things in connection with the cultivation of the *Odontoglossum* a little variation may be necessary according to the varieties to be dealt with, an intimate knowledge of which can be best obtained by the close observation of the cultivator.

A brief discussion followed the observations of the speaker, being mainly in support of Mr. Barnes' system of cultivation.

On this occasion Messrs. Sutton & Sons, Reading, exhibited a very fine collection of their seedling Potatoes, these being remarkable for their size, shape, and smoothness; and what is of the greatest importance, the majority of them are said to be disease resisting. The most notable amongst those that have been already sent out are—*Ringleader*, as the best early; *Sutton's Seedling*, the best second; and *Abundance*, as the best late variety. A newer variety called *Satisfaction*, is likewise one of great promise. The seedling varieties not yet in commerce were very fine indeed, and showed what can be done by the careful study and observation of the various crosses.

#### NATIONAL CHRYSANTHEMUM.

FLORAL COMMITTEE, October 24.—A meeting of this body took place at the Royal Aquarium on the above date, Mr. E. Sanderson, in the chair, there being a good attendance of members.

From Mr. W. Holmes, Frampton Park Nursery, Hackney, came the very fine yellow *Japanese Sunflower*, bright deep gold, large, striking, and a great addition to this section (*First-class Certificate*); *Nelson*, *Japanese Anemone*, rosy-purple, flushed with magenta, very fine and distinct (*First-class Certificate*); *Sabine*, *Japanese Anemone*, pale yellow guard petals and deep yellow centre—the first yellow flower in this section; the committee wished to see this again. Also a basket of reflexed large-flowered *Martinaz*, pink, tinted with lilac—very pretty and pleasing; and some others.

From Mr. Jno. Doughty, gr. to Mrs. M. Tomlin, Angley Park, Cranbrook, came *incurved Violet* Tomlin, a sport from *Frissess* of Wales, large, full, and of a deep lilac colour, shaded with purple; and also Mr. Tomlin, a sport from the *Japanese Mille*, *Paul Dufour*, reddish-cinnamon, shaded with purple (*Commended*). This will, no doubt, receive a higher award when the sport is quite fixed.

From Mr. W. R. Woodcock, Akbrook Gardens, Sheffield, came a seedling, *incurved*, named Mr. Woodcock, creamy-white, with sulphur centre (*Commended*). It will no doubt be seen later in better form.

From Mr. G. Stevens, St. John's Nursery, Putney, came white *Japanese Florence* Piercey, very pleasing. Awarded a vote of thanks.

From Mr. R. Owen, Castle Hill Nursery, Maidenhead, came several new varieties, among them *Japanese Magicienne*, in the way of *Criterion*, but of a shaded orange colour, very fine and distinct (*First-class Certificate*); *Lincoln's Inn*, orange-cerise, the reverse gold, a reflexed *Japanese* of promising character (*Commended*); and a *Pompon* *Maggie*, white, with a slight tint of lilac, in the way of *White Trevena*. A *Commendation* was awarded, the committee desiring to see it again in comparison with *White Trevena*. Mr. Owen had several other varieties, and a vote of thanks was awarded.

From Mr. W. Piercey came *incurved Japanese* Sam Henshaw, a very promising early variety—

colour purplish-magenta, with silvery reverse. (*Commended* as an early decorative sort.)

From Messrs. Davis & Jones, nurserymen, Camberwell, came *incurved large-flowering H. Shoesmith*, a bright golden-bronze sport from Mr. Bunn—a great acquisition. (*First-class Certificate*.)

From Messrs. James Veitch & Sons, Chelsea, came *Glady's Spaulding*, a large *Anemone*-flowered variety, orange-cinnamon guard florets and primrose centre—a promising flower; *H. A. Gane* and *The Moor*, a bright maroon-crimson reflexed. Awarded a vote of thanks.

From Messrs. J. Laing & Co., Stanstead Park Nursery, Forest Hill, came *Japanese Stanstead Surprise*, a large flat petalled variety in the character of *Baron Prailly*, bright ruby-red—very fine and distinct. (*First-class Certificate*.)

From Mr. Boyce, Archway Road, Highgate, came *Japanese Anemone* Miss Mary, lilac-pink, with sulphur centre.

It was a meeting full of interest for *Chrysanthemum* growers.

## Obituary.

W. H. CRAWFORD.—It is with great regret that it falls to my lot to record the death of this fine old Irish gentleman, which took place at his residence, Lakelands, near Cork, on the night of Thursday the 18th inst. Mr. Crawford was born in 1812, so that he was seventy-six at the time of his death. Born to great wealth, he used it liberally in enriching his native city and her best institutions. To the church of Ireland he was a staunch supporter, while the Queen's College, the schools of art, the cathedral, and other public institutions were recipients of his bounty. He visited the County Club on Thursday, the day of his death, and saw his physician there, who prescribed for him. He returned home and dined as usual, and was last seen alive by his servants as he sat reading in his chair, before they retired to rest.

On Friday morning he was found dead in his chair, the immediate cause being heart disease. Mr. Crawford was never married. Dignified in manner and of a retiring disposition, he had eyes and ears for all that took place around him, and his loss to his native city will not be readily replaced or forgotten. People of all callings and creeds within hearing of the beautiful "bells of Shandon" will mourn for the loss of a great man, and a benevolent friend.

Lakelands is a fine old house, richly stored with rare books, pictures, engravings, &c., while the surrounding grounds are richly planted with a perfect arboretum of rare shrubs and trees from all temperate parts of the world. Here the magnificent *Magnolia Campbellii* flowered for the first time in the open air, the tree being 30 or 40 feet in height. At the entrance to the mansion stand two large tubs of *Philæa buxifolia*, enormous masses, each 4 or 5 feet in diameter. Rare trees and shrubs from the Himalayas or Andes meet one's eyes at every turn, while extensive ranges of hothouses and greenhouses are stored with rich collections of *Orchids* and other choice exotics. The collection of *Brownes* here is one of the finest in existence, and there is a large house of rare Himalayan *Rhododendrons* and other shrubs not often seen in cultivation. Some years ago W. E. Gumbleton, Esq., took me to see Mr. Crawford, and the plants of which he was so fond. It was a cold wintry day, but we were welcomed and shown all over the place by the owner, whose face shone with delight as one after another of his floral treasures drew forth some exclamation of surprise.

But few amateurs have followed gardening pursuits with the energy and success which rewarded Mr. Crawford—few, indeed, could afford to do so; and it is to be hoped that his successor at Lakelands will respect the results attained at much trouble and expense in one of the finest climates in the British Islands, &c.

MRS. EYRE CRABBE.—On the 12th inst., at Bellagio, Italy, whither she had gone but a short time previously for the benefit of her health, at the age of

seventy-seven years, this well-known and estimable patron of horticulture, died. Mrs. Crabbe had in her beautiful place, Glen Eyre, near Southampton, a singularly lovely garden, replete with choice trees and shrubs, and laid out with great taste. Probably no garden in the kingdom are Camellias seen in such plenty and in such luxuriant growth in the open, whilst numerous other things, ordinarily esteemed tender, thrive. There also Mrs. Crabbe had the most entire confidence in the hardness of the Camellia, and her confidence is at Glen Eyre amply justified. Fifty years ago, then Mrs. Spooner, of Southampton, Mrs. Crabbe was one of the most active patrons of the old Hampshire Horticultural Society, and had for an ordinary competitor the late Canon Meadows, of Stoneham, and some other clerical horticulturists.

## THE WEATHER.

[Accumulated temperature indicates the combined amount and duration of the excess or defect of temperature above or below 32° F. for the period named, and is expressed in Day-degrees—a "Day-degree" signifying 1° degrees for twenty-four hours, or any other number of degrees for an inversely proportional number of hours.]

## THE PAST WEEK.

The following summary record of the weather for the week ending Oct. 22, is furnished from the Meteorological Office:—

"The weather has remained fair and dry in all but the extreme western and northern parts of the kingdom. Over England, however, thick fogs and heavy dews have occurred nightly.

"The temperature has been 2° or 3° above the mean in Ireland and Scotland, but below it in all the English districts. In 'England, E.,' the deficit has amounted to 5°. The highest readings were observed, as a rule, between the 18th and 20th, when the thermometer was a little above 60° in nearly all parts of Ireland and England. The lowest readings, which were registered on various dates, ranged from 23° in 'England, S.W.' (at Llandoverly), and 25° in 'England, E.,' to 37° in 'Scotland, E.,' and 38° in the Channel Islands. Over eastern and central England frost was experienced on most nights.

"The rainfall has been entirely absent in 'England, E.,' the Midland Counties, and 'England, S.,' and 'England, N.W.,' and very much less than the mean in all other districts. At some of the English stations, however, the heavy dews and fogs have occasionally yielded measurable amounts of water in the nights.

"Bright sunshine has been, upon the whole, less prevalent than it was last week. The percentage of the possible quantity has ranged from 13 in the north and east of Scotland to 42 in 'England, S.,' 49 in 'England, E.,' and 63 in the Channel Islands."

## MARKETS.

Lemons, per case	12 0-21 0	— St. Michael, each	2 0-5 0

## SEEDS.

LONDON: Oct. 24.—Messrs. John Shaw & Sons, seed merchants, of 37, Mark Lane, E.C., write that the articles which have lately been most in favour, are Alsika and Trefoil, both of which exhibit a further advance. Red and white Clover seed keep steady. There is no change in grasses. Winter Tares are cheaper with lessened demand. Some choice new Fillbasket Peas, of New Zealand growth, just imported, are now offering at 8s. 6d. per bushel. Canary seed is unaltered. Lower prices are taken for Hemp seed. Blue Peas are dearer; fine samples continue scarce. The new Haricot Beans are good and cheap.

## CORN.

Averages.—Official statement showing the average price of British corn, imperial measure, in the week ended October 20:—Wheat, 32s. 1d.; Barley, 28s. 10d.; Oats, 16s. 10d. For the corresponding week in 1887:—Wheat, 29s. 9d.; Barley, 28s. 10d.; Oats, 16s. 4d.

## FRUIT AND VEGETABLES.

SPITALFIELDS: Oct. 24.—There were good supplies of all kinds of farm and market garden produce to-day. Trade steady, at the undermentioned rates:—Vegetables: Savoys, 3s. 6d. to 4s. 6d. per tally; Cabbages, 4s. to 6s. do.; Cauliflowers, 4s. to 6s. do.; Brussels Sprouts, 2s. to 2s. 6d. per half-sieve; Greens, 2s. to 2s. 6d. per dozen bunches; Turnips, 2s. to 2s. 9d. do.; Carrots, 1s. 6d. to 2s. do.; Onions, 1s. 9d. to 2s. 3d. do.; Mint, 1s. to 1s. 6d. do.; Parsley, 1s. to 1s. 6d. do.; Beetroot, 2s. to 2s. 9d. do.; Celery, 4s. 6d. to 10s. do.; Horseradish, 9d. to 1s. 2d. per bundle; Belgian Onions, 2s. 6d. to 2s. 9d. per bag; Dutch Onions, 3s. to 3s. 6d. do.; pickling Onions, 4s. to 4s. 6d. do.; frame Cucumbers, 4s. to 5s. per dozen; Endive, 1s. 3d. to 1s. 9d. do.; Cos Lettuce 4d. to 8d. per score of 22; Carrots, 2s. to 3s. per ton. Fruit: Apples, 5s. to 6s. per bushel; do., 1s. 6s. to 5s. per half-bushel; Pears, 3s. to 5s. per bushel; English Plums, 3s. to 3s. 6d. per half-sieve; Damsons, 3s. 6d. to 4s. do.; English Tomatoes, 3s. 6d. to 5s. per peck.

## POTATOES.

SPITALFIELDS: Oct. 24.—Quotations:—Magnums, 60s. to 80s.; Imperators, 70s. to 85s.; Champions, 55s. to 60s.; Beauty of Hebron, 70s. to 100s.; English Regents, 67s. 6d. to 90s. per ton.

STRATFORD: Oct. 23.—Quotations:—Yorks, best, 80s. to 85s.; Lincolns, 65s. to 70s. Cambs, dark-lands, 60s. to 65s. per ton.

## NOTICES TO CORRESPONDENTS.

ARTIFICIAL MANURES: L. L. Lime may be applied on peaty soils at the rate of 5 cwt. per acre. On other soils, not containing much humus, 3 cwt. would be sufficient. Nitrate of soda and sulphate of soda, which are the best forms in which to apply salts of soda—altogether 1½ cwt. Superphosphate of lime may be made in sufficient quantity for 1 acre of land, by taking 4 bushels dry, crushed bones, and 50 lb. of ordinary sulphuric acid, and an equal quantity of water. Put the bones in an earthen or wooden vessel, and pour the mixture of water and acid gradually over them, stirring meanwhile. When the mixture has laid forty-eight hours, take it out and form a conical heap, and cover with wood-ashes, and after letting it lie undisturbed for a month, mix it still further with wood-ashes or fine soil, so as to produce about 20, 30, or 40 bushels per acre. Cover up again for a few days before finally breaking the paste up for use. It had better be applied all over the orchard, as the trees are standing close together. The lichens may be scraped off, or the trees syringed with lime-wash or brine in mid-winter.

**BOOKS:** *Constant Reader.* Thompson's *Gardener's Assistant*, revised by Thomas Moore, is offered by J. Wheldon, 58, Great Queen Street, Lincoln's Inn Fields, second-hand, price 21s.—*North Bank, Practical Treatise on the Cultivation of the Grape Vine* (W. Thomson). It is published by Blackwood & Sons, Edinburgh and London, price 6s.

*Cinquantus*, the *Epilogue of Gardening* is certainly published by Adam Black & Son.—*Draughtsmans, Thomson's Handy-Book of the Flower Garden*, Blackwood & Sons, London and Edinburgh; 7s. 6d.

**CHRYSANTHEMUM FLOWER BECOMING CHANGED IN FORM:** G. C. The change in the Chrysanthemum is only a reversion to the natural state. The mining larva is that of *Tephritis onopordioides*, and is common on Celery and Chrysanthemums, both cultivated and wild species. Burn badly affected leaves; the grub in lesser injured leaves may be killed by squeezing it.

**GLOXINIA BLOOMS:** J. T. Colours pretty, and that in the throat unusual. No far as could be seen from the withered flowers, the form is good.

**MARKET REPORTS:** *Essex.* Owing to the great pressure on our space, caused by the recent Fruit Conference, it has not been convenient for us to publish these as usual.

**NAMES OF PLANTS:** C. B. R. 1, *Ruellia speciosa*, syn. *Dipteracanthus affinis*; 2, *Bignonia*; 3, *Xylophylla latifolia*; 4, *Pellionia Davaeana*; 5, *Phyllanthus nigrosus*; 6, *Sedum Sieboldii*.—*Humming*, *Tillandsia argentea*.—R. C. B. *Rosa rugosa* (Japan Rose).—J. S. W. 1, *Polypodium irioides*; 2, *Asplenium bulbiferum*; 3, *Polypodium glaucum*; 4, *Adiantum tenerum*; 5, *Platyloma rotundifolia*; 6, *Polypodium pustulatum*.—S. E. *Eria truncata*.—W. S. C. P. 1, next week; 2, *Campanula macrorrhiza*; 3, *Iris* (flower too decayed to identify); 4, *Bellidistoma Micheli*; 5, *Wahlenbergia gracilis*; 6, *Aster novae-anglicae* var.—A. J. B. *Stapelia bafonia*.—A. K. D. 1, *Centaurea macrocephala*; 2 and 4, *C. Tournefortii*; 3, *C. ruthenica*; 5, *C. sulphurea* (= *C. calcephala* var. *flava*); 6, *C. dealbata*; 7, *C. tartarica*. H. A. J. *Agaricus personatus*, *A. nebularius*, *Polyporus lucidus*.—W. Jenkins, *Oncidium volvox*.

**PHYLLIXERA:** D. B. No trace.

**SEEDLING BRIKERS:** E. E. Cannot be budded or grafted till the third or fourth year after sowing—the strongest in the former, and the weaker ones in the latter.

**VINE BORDER:** G. E. Lloyd-Baker. The archway, or tunnel, running the length of the border, may have been made with an idea of warming the border, either by artificial heat or by letting in sun-heat. It might remain, but it should have a greater number of holes made at the lowest point, and quite as low as the floor of concrete, so that the water may drain off quickly. A border 3½ feet deep is unnecessary, and at least 1 foot might be filled up with rubble, and made with a slope to the drainage outlets. In remarking the border use a considerable portion of turfy loam—calcareous, if you can get it—and lime rubbish, plaster, and the like, broken small, and mixed with it. No manure should be used, as that tends to the souring of the soil in the end, and stimulants to growth are better given in the form of surface-dressings either of partially decayed farmyard manure, or some special artificial kind. In making the border, place thick turves with the grassy side downwards over the rubbish, and do not make the border at first much thicker than is necessary to find space for the roots either of the old Muscat Vines or new plants; the rest of the border can be made as required. Make the border 8 or 9 inches higher than its subsequent level, as the new soil will sink considerably; and in case new Vines are planted, defer this operation till the spring.

**VIOLETS:** E. E. These are commonly sent to market in large bunches, with their own foliage, the flowers being cut with the longest possible amount of stalk. We do not know who is the largest grower of these flowers. There is no book on the culture of the Violet.

**COMMUNICATIONS RECEIVED.**—F. W. B.—G. J. L.—J. K.—Count Solms, Strasbourg. T. A. B.—J. G. B.—D. L.—M. F. J.—W. J. C.—B. T.—S. D.—C.—Prof Sargent Arnold, Amherst, Cambridge, Mass.—T. B. H.—J. G. **The only complete Collection of Daffodils existing.**  
**BARR'S NEW DAFODIL CATALOGUE**  
for 1889. Now Ready. Free on application.  
Containing a full Descriptive List of High-class and Distinct Daffodils only, and also a Descriptive List of Beautiful Hardy Daffodils, at greatly reduced prices. This Catalogue also contains Barr's Specialty Collection of Iris, Lilies, Paeonies, Michaelmas Daisies, Plantains, Lilies, Day-Lilies, and a select List of Showy Hardy Herbaceous Plants.  
BARR AND SON, 12 and 13, King Street, Covent Garden, W.C.

**"PAUL ENGLEHEART."**  
Roots: Layers of the above fine Crispum Bedding CLOVE (CLOVE) are now ready to lift. The variety can be confidently recommended as possessing all the good qualities of the "Old Clove," with much greater vigour of constitution, and a dwarf sturdy habit, which REQUIRES NO STICKS.  
Price, 2s. each, 18s. per dozen, 9s. half-dozen.  
GILBERT DAVIDSON, Ammanford, R.S.O., Carmarthenshire

**Christmas Roses—(the large-flowering variety).**  
**100,000** fine, healthy and strong Plants to select from, all my own growing (not imported), as far as unsold—

Extra size	Per 100.	Per 1000.	Per 10,000.
1st	...	...	...
2nd	...	...	...
3rd	...	...	...

SEEDS: JAPONICA, 2s. each, 18s. per dozen, 9s. half-dozen. GLADIOLUS BRENDELLENSIS, 2s. each, 18s. per dozen, 9s. half-dozen. For large quantities special prices on application. Cases and packing free. Offered by HERMAN BUDDENGER, Bulb Grower, Hillegom, near Haarlem, Holland.

**OLD-FASHIONED HEDGES.**—English  
Yews, bushy, and with a profusion of fibrous roots, 1½ to 2 feet, 6s. per dozen, 60s. per 100; 2½ to 3½ feet, 8s. per dozen, 80s. per 100; 2½ to 3½ feet, 8s. per dozen, 80s. per 100; 3 to 3½ feet, 12s. per dozen, 120s. per 100. Prices of larger sizes and other Evergreens, suitable for Hedges—e.g., Tree Box, Holly, Laurel, Privet, Cypress, Juniper, Thuja, &c., on application.—RICHARD SMITH AND CO., Nurserymen and Seed Merchants, Worcester.

**W. GORDON, IMPORTER OF ORCHIDS.**  
An Immense Stock of recently-imported Plants compels a sale of the established plants to make room. They have not yet flowered, but are all flowering plants, and must be sold at a great sacrifice. Very valuable varieties are certainly to be obtained, and great bargains. See Public Journals for high prices recently obtained. The Special Offer affords a paying investment to anyone with glass at command, which should not be overlooked. Such plants may never again be offered to the public and the Trade. LILIES, Silver Banksian Medal, Silver Medal National Chrysanthemum Society, September, 1888. JAPANESE MAPLES, Silver Banksian Medal.

**THREE FINEST** First-class Certificates.  
"IRIS, most gorgeous, 4 First-class Certificates.  
CATALOGUES of the above on application to The Nurseries, Amyand Park Road, Twickenham.

**Dutch Bulbs Traced from the Growers.**

## HOT-WATER BOILERS,

And others with SHELVES, and Hollow or Ordinary Cast-iron GRATE BARS.

**SADDLE BOILERS,** With WATERWAY BACKS and WELDED BOILERS, any of which are specially adapted for Heating Greenhouses, Conservatories, Churches, Chapels, Schools, Public Buildings, Entrance Halls, Warehouses, Workshops, &c. They are the neatest, cheapest, most effective, and durable of any extant.

The MUNICIPAL and TUBULAR ones are remarkable for their great heating power, slow combustion, and the length of time the fire will burn without requiring attention.

These Patterns secured the FIRST and HIGHEST PRIZE—a SILVER MEDAL—at the Royal Horticultural Society's Exhibition, South Kensington, London June 1 1881.

### The Best Boiler Extant.

— FRONT ELEVATION —

— LONGITUDINAL SECTION —

SECTIONAL PLAN

The longitudinal section gives a view of the fire-box, water space, flues, &c.

The front elevation shows it set in brickwork, which is necessary for this class of boiler.

The cross section gives a view of the fire-box, water space and V-shaped back.

### TESTIMONIALS.

MESSRS. THOS. GREEN AND SON, LTD., NORTH STREET, LEEDS.

GENTLEMEN,—I have great pleasure in bearing testimony to the efficiency and satisfactory working of the Hot-water Heating Apparatus you erected in these public buildings. The buildings are four storeys high, and we have a total length of about 25,000 feet of piping in them, varying in size from 1½ in. to 6 in. diameter, with their connections, &c. The several offices and rooms can all be in operation at one time or separately, and the heat regulated by means of the valves to the temperature required, even in the coldest weather.

Two of your Patent Municipal Pattern Boilers, No. 4, work the whole of this piping easily, although we have three of them fixed. They are very powerful and economical in the consumption of fuel, and I am pleased to be able to report of them and the apparatus so favourably.

I am, Gentlemen, yours truly,

Morley House, Bagot, St. Saviour's, Jersey, November 10th, 1886.

GENTLEMEN,—The large Municipal Boiler which you sent me last year is doing its work satisfactorily; it is heating 5,000 feet of 4-inch pipe in one of my vineries, and I am quite sure that it has power to work a much greater length, while in cost of fuel it compares favourably with my other Boilers.

I have now five of your Boilers in use, and I cannot speak too well of their heating powers, or their comparatively small consumption of fuel.

MESSRS. THOS. GREEN AND SON, LTD., LEEDS.

Yours faithfully,

(Signed)

G. W. BASHFORD.

AND HUNDREDS OF OTHER REFERENCES CAN BE GIVEN IF REQUIRED.

## THE GARDENERS' CHRONICLE FORM OF SUBSCRIPTION.

## Estate Sales.

The best County medium for Advertising Sales of  
Estates is

**THE WORCESTER HERALD**, the largest  
and leading County paper. Extensive circulation among  
the upper and middle classes in Worcestershire and adjoining  
counties. Advertisers would do well to forward for reference  
and distribution, plans and particulars of Estates, Catalogues  
of Machinery, Furniture, Books, and other property advertised  
in the columns of the *Worcester Herald*. Specimen copies sent  
free. Published Friday for Saturday, price 2d.  
Offices, 72, High Street, Worcester.

## Sales of Stock and Agricultural Effects.

**THE WORCESTER HERALD** is the most  
effective organ for giving publicity to announcements of  
this class. It is the largest and leading Agricultural paper in  
the county, and circulates most extensively among Agriculturists  
in and around Worcestershire. Specimen copies free.  
Published Friday for Saturday, price 2d.

Offices, 72, High Street, Worcester.

## Farms to be Let.

**LAND AGENTS, ESTATE MANAGERS**, and all having Farms  
to Let, would do well to Advertise in

**THE WORCESTER HERALD**, the Largest  
and Leading County Paper. Specially adapted for  
bringing such notices before Tenant Farmers. Large Circulation,  
moderate charge. Specimen free. Price 2d. Published  
Friday for Saturday.

Offices, 72, High Street, Worcester.

**LINDLEY'S MEDICAL and ECONOMIC BOTANY.** With numerous Illustrations. 8vo.  
loth. Price 5s.

**LINDLEY'S DESCRIPTIVE BOTANY.**  
For Self-Instruction and the Use of Schools. Price  
1s. sewed.

Street, E.C.

## GARDENING APPOINTMENT.

**MR. A. BENTLEY**, late Gardener to R. S.  
NEWALL, Esq., Ferndene, has been appointed  
Gardener to H. H. COCHRANE, Esq., Eshwood  
Hall, Durham.

**W. HOWARD**, Florist,  
of Old Southgate, N., is  
desirous of meeting with an energetic young man as  
PARTNER to assist in Enlarging his Well-established Nursery  
and Florist Business and to Conduct the Town and Market  
Department. Must be a good Salesman. Capital required,  
£500 or upwards. The Nursery may be viewed at any time.

**WANTED, a HEAD WORKING GARDENER.**—Must thoroughly understand the Manage-  
ment of Orchids, Stove and Greenhouses, Vinery, and Kitchen  
Garden. Two Under Gardeners kept. Cottage found. State  
wages. Good character and good last employer indispensable.—  
Lieut.-Col. C. N. KIDD, West Hill House, Dartford.

**WANTED, a FOREMAN**, in the Houses.  
Must have good knowledge of the business. Feathers, &c.,  
and be well recommended. Age not under 25. Wages, 12s. per  
week and botby.—E. CLARK, Cannon Hall, Barnsley, Yorks.

**WANTED, IMMEDIATELY, a LAND-  
SCAPE FOREMAN**, young, with first-class references.—  
MARSHALL, BROS. and CO., Barnham, Post-town, Bognor.

**WANTED, a GROWER** for Market, Roses,  
Stephanotis, Eucharis, &c.—H. DICKINSON, Shard-  
low, near Derby.

**WANTED, an energetic young MAN**, well up  
in Plant Growing for Market, and Chrysanthemum  
Culture. Quick at Potting and Watering. None but good  
workmen need apply, stating wages required, to R. OWEN,  
Floral Nursery, Maidenhead.

**WANTED, IMPROVER**, age 17 to 18; one  
who has some experience in a Garden. An abstainer.  
—F. S., 29, Stanley Street, Raddington, W.

**Nursery and Seed Trade.**  
**WANTED, a TRAVELLER**, a thoroughly  
efficient trustworthy, energetic, sober, and steady  
man.—Send particulars of experience, age, references, salary  
expected, to TRAVELLER, *Gardeners' Chronicle* Office, 41,  
Wellington Street, Strand, W.C.

**The Seed Trade.**  
**WANTED, a HEAD SHOPMAN.**—Apply,  
stating age, experience, wages required, &c., to-  
gether with copy of testimonials, to DANIELS BROS.,  
Royal Norfolk Seed Establishment, Norwich.

Retail Vegetable Seed Department.—Must be steady,  
industrious, and smart.—Apply, with full particulars and  
references, to HARRISON AND SONS, Royal Midland Seed  
Warehouse, Leicester.

**Seed Assistant.**  
**WANTED, a young MAN**, of good address,  
quick at Counter Work.—Apply, by letter only, to J. M.  
STEWART, 15, Market Street, Nottingham.

**WANTED, by a Landscape Gardener**, partial  
employment, a DRAUGHTSMAN, in preparing  
finished Plans from Rough Outlines. Work could be done at  
home.—Reply, stating experience and time at disposal, to S.  
*Gardeners' Chronicle* Office, 41, Wellington Street, Strand, W.C.

## WANT PLACES.

Letters addressed "Poste Restante" to initials or to fictitious names are not forwarded, but are at once returned to the writers.

**NOTICE TO ADVERTISERS**—In many instances Remittances in Payment of Repeat Advertisements are received without name, address, or anything beyond the postmark on envelope by which to identify the sender; this in all cases causes a very great deal of trouble, and frequently the sender cannot be identified at all.

Advertisers are requested when Remitting to give their Names and Addresses, and also a Reference to the Advertisement which they wish repeated.

**POSTAL ORDERS**—To Advertisers, Subscribers, and Others.—It is very important in Remitting by Postal Order that it should be filled in payable to No. 42, DRURY LANE, to W. RICHARDS, as, unless the number of a Postal Order is known, and it has been made payable at a particular office, and to a particular person, it is impossible to prevent any person into whose hands it may fall from negotiating it.

N.B.—The best and safest means of Remitting is by POST-OFFICE ORDER.

Gardeners, Farm-Balliffs, Foresters, &c.

**DICKSONS (Limited)** are always in a position to RECOMMEND MEN of the highest respectability, and thoroughly practical at their business. All particulars on application. Telegraphic and Postal Address "DICKSONS, CHESTER."

**RICHARD SMITH AND CO.** beg to announce that they are constantly receiving applications from Gardeners, seeking situations, and that they will be able to supply any Lady or Gentleman with particulars, &c.—St. John's Nursery, Worcester.

## SCOTCH GARDENERS.

JOHN DOWIE (of the late farm of Downie & Laird), Seedsman, 144, Princes Street, Edinburgh, has at present on his List a number of SCOTCH GARDENERS, waiting re-engagement. He will be pleased to supply full particulars to any Lady, Nobleman, or Gentleman requiring a trustworthy and competent Gardener.

**GARDENER (HEAD)**, where two or more are kept.—Age 31, single at present; over three years' character from present situation as Foreman.—H. HALL, The Gardens, Lower Woodside, Hatfield, Herts.

**GARDENER (HEAD)**.—Age 39; practical knowledge of the general routine of Gardening. Renovation of Grounds, &c.—J. W. HALL, Ivy Cottage, Beedingwood, Horsham, Sussex.

**GARDENER (HEAD)**, where two or more are kept.—Age 37, married, with family; fifteen years' character from former employer. Thoroughly experienced in all branches.—S. A., Bradfield, Mauntingsree.

**COWMAN, or GARMAN**, in private family.—Young; wife understands Dairy. Ten years' good character.—J. ADDISON, 3, Lower Camden, Chelsea.

**HOLLOWAY'S PILLS**.—Nervousness and Want of Energy.—When first the nerves feel unstrung, and listlessness supplants energy, it is the right time to take some alternative as Holloway's Pills to prevent disorder running into disease. These excellent Pills correct all irregularities and weaknesses. They act so kindly, yet so energetically on the functions of digestion and assimilation, that the whole body is revived, the blood is rendered richer and purer, the muscles become firmer and stronger, and the nervous and absorbent systems are invigorated. These Pills are suitable for all classes and all ages. They have a most marvelous effect on persons who are out of condition; they soon rectify whatever is in fault, restore strength to the body and confidence to the mind.

LADIES SAVE FROM 25 TO 40 PER CENT. BY PURCHASING DIRECT FROM THE DARLINGTON LOOMS.

The Darlington Royal Victoria

## “AMAZON”

COSTUME CLOTH.

*Specially Dyed and Finished for Winter Costumes.*

HENRY PEASE AND CO.'S SUCCESSORS have many thousands of customers on their books who enjoy to the full the advantages of buying the best goods at first hand.—The immense choice of patterns.—The certainty that the goods are really new and of the latest fashion.—Superb quality.—Guaranteed durability—and the saving of all but the small profit charged by the manufacturer. All goods are warranted to be equal to samples.

A Sixpenny Telegram to “SUCCESSORS, Darlington,” will bring the box of patterns by next post, and all orders are executed the same day as received.

### HY. PEASE & CO.'S SUCS.,

Spinners and Manufacturers,

THE MILLS,

DARLINGTON, ENGLAND.

ESTABLISHED, 1752.

This Firm buy their Wools direct from the English Farmer. After careful sorting and cleaning, the wool is spun into yarn, and the yarn woven into the various charming fabrics for which the Firm have been renowned since their establishment in 1752—the entire process of manufacture being carried on in their own Mills at Darlington, employing more than 1000 hands.

GOOD OLD TUG may tug away at his little mistress's dress, but a Cross-Warp Serge of Darlington fame will stand all his tugging.

The compact and old-established NURSERY and FLORIST'S BUSINESS FOR SALE, by Order of Mr. W. A. Ginge, who is leaving the neighbourhood.

MESSRS. PROTHEROE and MORRIS are instructed to SELL by AUCTION, on the Premises, the WAVELEY NURSERY, situated in the Finchley Road, London, N.W., a few minutes' walk from Marlborough Road Station, on THURSDAY, November 15, 1888, at 2 o'clock precisely, a going concern, the compact Leasehold Property known as the WAVELEY NURSERY, with 1½ acres of land, with 11 Greenhouses, Pits, Stabling, and the whole of the Stock and Utensils in Trade, held for about 12 years unexpired at £20 per annum; also the Florist's Shop, No. 15, Finchley Road, occupying a prominent position, and held for 19 years unexpired at £50 per annum; 4 span-roof Greenhouses in Queen's Terrace, held for 15 years at £45 per annum; and a piece of Nursery Ground at the corner of Alexandra Road, close to London Road Station, held at £20 per annum.

Particulars and conditions of Sale may be had on the Premises; of Messrs. GOWING & CO., Solicitors, 40, Finsbury Pavement, E.C.; and of the Auctioneers, 67 and 68, Cheapside, London, E.C., and Leytonstone, E.

## Friday, November 16.—Cypripediums.

MESSRS. PROTHEROE and MORRIS will include in their SALE by AUCTION, on FRIDAY, November 16, about twenty-five lots of choice CYPRIPEDEUMS from a well-known private collection. Further particulars will appear next week.

## Barnet, N.

By order of the Court of Chancery. Cornwall v. Cornwall. SALE of the old-established NURSERY BUSINESS as a going concern, and also about 6 acres of FREEHOLD and CO-RENTED LAND.

MESSRS. PROTHEROE and MORRIS are instructed to SELL by AUCTION, at the Mart, Tottenham, on FRIDAY, November 30, at 2 o'clock precisely, the following properties:—

Lot 1.—The old-established NURSERY, SEED, and CUTTING BUSINESS, known as the HALEY NURSERY, Barnet, N., occupying a good position in the best part of the High Street, within eight minutes' walk of the High Barnet Railway Station. The property comprises about 10 acres of ground, with eight Greenhouses, a Dwelling-house, and a Seed Shop, the whole held for an unexpired term of about fifteen years at the moderate rental of £60 p. a. annum. The Goodwill of the Business carried on for so many years will be included in this lot.

Lot 2.—About 6 acres of valuable FREEHOLD and COPYHOLD LANDING or NURSERY LAND, known as the COMMON NURSERY, BARNET, N., with frontages to the main road, and to Union Lane in the rear.

Lot 3.—Two acres of LAND, opposite Lot 2, held at £2 p. a. annum.

This Sale offers an unusual opportunity for any one desirous of embarking into the Nursery Business. The whole of the STOCK IN TRADE will be sold by Auction, thus enabling purchasers to secure only such stock as may be required for carrying on the business at unreserved auction prices.

Particulars and Conditions of Sale may be had on the Premises, of Messrs. HOUGHTONS and BYFIELD, Solicitors, 65, Gracechurch Street, London, E.C.; and of the Auctioneers, 67 and 68, Cheapside, London, E.C., and Leytonstone, E.

## Extensive Importations of Orchids.

MESSRS. PROTHEROE and MORRIS will SELL by AUCTION, at their Central Sale Rooms, 67 and 68, Cheapside, London, E.C., AT AN EARLY DATE, extensive importations of ORCHIDS, recently direct, being the contents of about 50 cases; amongst them will be found a large consignment of Cattleya Percivaliana, also C. lobata superba, C. labiata Warneri, and Oncidium Papilio, received from Mr. F. A. Warner.

The plants are in splendid condition. Full particulars will appear next week.

## Cheap Bulbs.

MESSRS. SMALL and CO. will SELL by AUCTION, at 123, Fenchurch Street, City, E.C., on MONDAY, WEDNESDAY, and THURSDAY, November 6, 7, and 8, at 12 o'clock every day, large consignments of AZALEAS, SPIRÆA, GLADIOLI, HYACINTHS, TULIPS, CROCUS, &c., lotted to suit all buyers.

Horticultural Auction Rooms, 123, Fenchurch Street, E.C.

## COMPENSATION FOR ORCHARD PLANTING.\*

IT is, no doubt, solely because of the great  
interest which for many years I have taken  
in compensation for tenants' improvements, that  
I have been invited by the committee of this  
Conference to read a paper upon a subject of the  
practical details of which I probably know less  
than any person in this room. I must confess  
that I felt a strong disinclination to place my  
views before a body of experts, and if any-  
one but your Secretary, who has been very  
kind to me on more than one occasion, had  
asked me to come forward, I should have  
declined. For, should any one ask me what I  
know about orchard planting, I should have to  
reply—Next to nothing. When I took a farm  
some years ago I planted some fruit trees, and  
had them in fine bearing condition by the time  
that I quitted the holding, to the advantage  
of my successor. More recently I have planted  
some Apples and Pears in a suburban garden,  
and have scarcely seen a blossom on any of them  
for the last three years. However, my subject is  
not planting, but compensation for planting, and  
upon that topic I have very decided views, and  
few persons, I believe, have given more thought  
to it. Still, as my object is to elicit discussion  
rather than air my own opinions, I shall be as  
brief as possible in my remarks.

Cultivators of the soil are constantly being  
told that they should grow more fruit. Ordina-  
ry farming does not pay, and is not likely to  
pay, it is contended, and farmers should turn  
their attention to the production of vegetables  
and fruit. Now, there is no reason to fear that  
too many farmers will take that advice, the rank  
and file of the class being very slow to make any  
important changes in their routine. It is obvious  
that if even a twentieth part of the land of the  
United Kingdom were devoted to the growth of  
vegetables and fruit, the market would be glutted,  
unless the nation were converted to vegetarian-

\* A paper read at the Chiswick Fruit Congress, by William  
F. Bear, Streatham.

ism. But, as I have said, there is no reason to fear that too many farmers will become market gardeners and fruit growers, and there will be all the less reason to expect this if, as I believe, a turn in the tide of ordinary farming as a business has set in—whether for a long or for a short period it would be rash to predict. The fear is—to confine myself to fruit-growing—that, in spite of the “boom” which appears to have been started in that industry, its development will be slower than is desirable. There are many reasons why it should be so. Enough has been said in recent years, and said over and over again, to prove that it is desirable to grow more fruit, and especially more choice Apples and Pears, in this country. The question is—How to do it? Now, in my opinion, Mr. Rivers, in his speech as Chairman of the Fruit Growers' Conference held the other day in the Crystal Palace, went the right way to work to show how not to do it. Alluding to the obstacles to fruit-growing, he is reported to have said that landlords, land laws, railway rates, and middlemen have nothing to do with them. A more astounding assertion I have seldom read. In my opinion they have pretty well all to do with them. It is our land laws which render fruit-planting an unsafe speculation, and high railway rates and a bad system of distribution (the middleman element) which renders fruit-growing less profitable than it should be. I think my friend, Mr. Albert Bath, was on the right tack in the paper which he read at the first Crystal Palace Conference, and not Mr. Rivers, who declared ignorance to be the fundamental hindrance to extended fruit culture. No one is a more earnest advocate of agricultural and horticultural education than I am, and no one is less disposed to say anything to underrate the advantages of either branch of instruction. But, in my opinion, for one cultivator of the soil prevented from growing fruit by ignorance, there are twenty who are deterred from lack of security to capital invested in planting, high railway rates, which render it unprofitable to grow anything except high-priced early produce if it has to go a long distance by rail, and our abominable system of distribution, which gives more profit to the middleman for a day's, or sometimes for an hour's work, in handing fruit on to customers, than to the producer who spends a year in growing it.

#### THE LAND-LAWS.

Returning to the question, How is fruit growing to be increased? I must pass by, as beyond the range of my subject, all details relating to such obstacles as high rail charges and the middleman's undue share in the amount paid by consumers for fruit. In considering how to answer the question asked, another at once crops up—Who is to plant? Now our land laws are directly opposed to planting as far as they go. By encouraging limited ownership through the settlement of estates they render it disadvantageous to most landowners to plant, because the limited owners, who form the great majority of the landlord class, by sinking their capital in orchard planting, would reap only a transitory benefit themselves, and that only if they lived several years, while they would enrich the already too highly favoured heirs to their land at the expense of their younger children or other relatives. For reasons which it would take me very wide of my mark to-day to state, I am not in favour of increasing the powers and privileges of the owners of land by making them absolute owners, and I allude to limited ownership merely to show that under it there is no reason to expect extensive orchard planting by landlords. We come now to the tenants, and are thus brought within the precise confines of the subject of this paper.

Mr. Rivers appears to argue that the land laws have nothing to do with the indisposition of cultivators to plant fruit, because in suitable situations

and under proper management fruit-planting will pay with laws and rents as they are. No doubt it will, provided that the planter has a long lease, and lives long enough to reap the fruits of his enterprise, or if—and this is a very large “if”—he can induce his landlord to consent to the planting, so that he will be entitled to compensation under the Agricultural Holdings Act, or to arrange otherwise to compensate him or his heirs when he quits his holding or dies. These “ifs” and “ors” however, are shadowy particles, and a substantial and disagreeable “but” nearly always comes in to put them to flight. Without the consent of the landlord in writing the law fails to afford the fruit planter, whether he be a large farmer or an allotment holder, a halfpenny of compensation for capital sunk in the planting of fruit; and I doubt whether that consent can be obtained by one out of a hundred tenants. The tenant, then, has no legal security for fruit-planting, and if he plants without security he incurs a very serious risk. It may be contended, perhaps, that a long lease affords a sufficient security; but that I entirely dispute, because a man may die before he has reaped any benefit from his expenditure, and it may be inconvenient for his executors to carry on his business, or he may be obliged to remove, either from getting into difficulties or from some less disagreeable cause. Therefore a lease is but a delusion as security unless it contains compensation clauses, or embodies a right of assignment. Moreover, a lease never affords adequate security, unless it is a very long one, even if the holder of it farms it out. Even then, at the end of the lease, the improving tenant—or rather, the law—hands over to the landlord property which rightly belongs to himself.

#### COST OF PLANTING.

It is not necessary to say before my present audience that the expense of orchard planting is no light one, or to point out some years must elapse before the planter can hope to obtain a satisfactory return on his outlay. Probably there is no gentleman here who could not tell me a great deal more about the cost of planting than I can tell him. But as there may be readers of this paper who are not experts, and who may like to have the estimates of experts on the cost of planting different kinds of fruit, I submit such estimates. There is no lack of them in print; but most of those in my possession are two, three, or more years old, and expenses vary with the times. I therefore asked Mr. Charles Whitehead to give me his estimates for the present time, and I have to thank him, a busy man—though for that matter busy men are generally the most obliging in affording information—for kindly complying with my request. In giving Mr. Whitehead's estimates I must point out that they do not include the cost of preparing the land, or any portion of the rent, tithe, rates, and labour expenses after planting which fall due before the trees come into profit.

#### Cost of Planting One Acre of Fruit.

Standard Apple trees, 22 feet apart (90 trees)	£ s. d.	£ s. d.
Planting and staking ... ..	2 17 6	
Plums or Damsons, 18 feet apart (134 trees)	7 15 0	8 17 6
Planting and staking ... ..	3 15 0	
Apples and Plums, mixed, 20 feet apart (108 trees) ... ..	7 0 0	
Planting and staking ... ..	3 5 0	11 10 0
Bush fruit trees under Apples, 1440 to the acre, ½ ft. apart, at 13s. per 100 ... ..	9 0 0	
Planting bush trees ... ..	2 15 0	
Ninety Apples and planting and staking ... ..	8 17 6	20 12 6
Bush fruit with Plums or Damsons—1440 bush-fruit trees ... ..	9 0 0	
Planting ditto ... ..	2 15 0	
134 Plums or Damson trees, and planting and staking ... ..	11 15 0	23 10 0
Strawberries, 30 × 18 inches=11,616 plants, say 12s. 6d. per 1000 ... ..	7 4 3	
Planting ... ..	1 15 0	8 19 3
Strawberries, 30 × 12 inches=17,424 plants, at 12s. 6d. ... ..	10 13 6	
Planting ... ..	2 7 6	13 6 0
Raspberries, in rows 4 feet apart, three plants to a hill or centre at 18,000 plants ... ..	10 17 6	
Planting ... ..	2 5 0	13 2 6

Mr. Whitehead adds:—“All these rates are according to present cost of fruit trees and present labour wages. The land, of course, must be deeply ploughed, and in many cases a subsoil plough should follow the ordinary plough. Harrowing also is necessary to get a level surface. Upon land in cultivation a good dressing of manure would be necessary, say 20 ton per acre. Some land would require trenching.”

Mr. Albert Bath, of Sevenoaks, has also kindly sent me some estimates, which represent the actual cost of planting now being carried out under his superintendence:—

#### Cost of Manuring, Ploughing, Subsoiling Trees, and Planting, per Acre.

Apple plantation, trees 20 × 20 feet apart ... ..	£21 0 0
Plums, 20 × 20 feet ... ..	18 16 0
Pears about same as Apples ... ..	21 0 0
Mixed plantation of Apples, Pears, Plums, 20 × 20 feet with bottom fruit—Currants and Gooseberries ... ..	35 8 0
Raspberries (manuring and cultivation as above, excepting subsoiling) ... ..	17 5 0
Strawberries, ditto ... ..	13 7 0

Mr. Bath remarks that fruit trees and Raspberry canes are as cheap as they were six years ago, but that Apple trees are in great demand, and will soon be dearer.

Although the planting of Strawberries and Raspberries does not come under the head of orchard planting, the estimates for these crops are allowed to appear in the list. I may add that Mr. William Vinson, of O'pington, Kent, has kindly given his estimates of the cost of planting of an acre of these varieties of soft fruit. Including the first year's cultivation, rent, rates, &c., he says, Raspberries cost about £15 an acre, and Strawberries about £10.

The veriest outsider must see from these figures—and especially from those relating to orchard planting—that it would be very risky for a tenant to engage in that enterprise without security as to compensation for the unexhausted value of his improvements; and it is to be borne in mind that Mr. Whitehead's totals should be larger than they are, because they do not include additional expenditure incurred while waiting for the trees and bushes to bear.

#### TENANT'S COMPENSATION.

How, then, should compensation be given? Personally, I am a strong advocate of the plan of allowing the tenant to sell his improvements in the market, with preemption to the landlord. Elsewhere, and on many occasions, I have shown how I would safeguard the just claims of landlords in making the necessary arrangements for free sale. There is not time to allow of my going into details upon that topic to-day. Moreover, to do so would be needless repetition, for are they not written in the chronicles of the Farmers' Alliance—an association which would have done great things for the farmers and fruit growers of the country if they had sufficiently supported it? In my opinion, free sale is far superior to the valuation system. When told that it involves dual ownership in land, I always say, in reply, that where two persons invest their capital, and inextricably mix it in the same piece of land, you must have dual ownership or confiscation. There is absolutely no other alternative; and if you have a right to compensation by valuation, you have dual ownership just as much as if you have free sale. Again, I am told that free sale has not succeeded in Ireland; but the reply to that is that it was a splendid success in Ulster before Mr. Gladstone meddled with it, and, in my opinion, muddled it. Having visited Ulster, I say that the results of free sale there are wonderful. Considering the disadvantages in respect of situation, climate, and often of soil also, under which the farmers in that province laboured, what they did, stimulated by the security afforded to them by free sale, long before the Land Acts were passed, is a striking proof of the value of the principle.

It must be confessed, however, that free sale is not popular in this country. It may further be admitted that the system of compensation by arbitration and valuation can be carried out more satisfactorily in relation to fruit trees than in the case of ordinary farm improvements. The trees are on the ground,

and can be counted and valued, and their condition indicates how they have been manured and otherwise treated. In some parts of Italy it is the practice to make an inventory of all the trees on a holding when the tenant enters, describing the number of trees of each kind in each enclosure, indicating the condition of the whole in general, if not of each, and valuing them. When the tenant quits, a similar inventory is made, and he is entitled to receive, or required to pay, any difference in the two valuations, according to whether he has caused appreciation or deterioration during his tenancy. Whether or not any allowance is made for natural improvement on the one hand, or deterioration similar to the reasonable "wear and tear" in a house, on the other, I cannot say. Perhaps some such plan could be adopted in this country.

The simplest reform, however—and I believe that fruit growers and farmers can get it if they will but act together—would be that of striking out the stipulation in the Agricultural Holdings Act which requires the landlord's consent to entitle the tenant to compensation for planting fruit trees, and for other permanent improvements. But as I have always been a friend—an unappreciated friend—to landlords, I must state one objection to this proposal. It would be hard to come down upon a poor, embarrassed landlord, or upon one fairly well-to-do, but only a tenant for life, for £20 an acre or more on 100 or 200 acres, in the form of compensation to an outgoing tenant. Therefore, it seems to me that if the tenant is to be entitled to compensation for costly improvements made without the landlord's consent, the latter should have the option of presenting the right of free sale to the former. Or, perhaps, as landlords have always opposed free sale, it will be but a fitting lesson to them to make the amendment in the Agricultural Holdings Act just suggested, and to leave them to sue for free sale which, I fancy, under the altered circumstances, many of them would very quickly demand. At any rate, in one way or another, I contend, it is the right and the duty of the public to insist that the law of the land shall be so altered as to encourage, instead of hindering, the greatest profitable development of the resources of the soil. They should not recognise the right of a man who is allowed to "hold an estate in land"—the nearest approach to absolute ownership recognised by the law of this country—to keep it as a desert waste, or anything like a desert waste, if it will pay for improvement, and there are capitalists able and willing to improve it. Or, to limit the application of this principle of public right and duty to the subject before us, I say that the people of this country, desirous as they are to see planting increased, should insist on their representatives in Parliament, without unnecessary delay, so amending or adding to the statutes as to afford to every cultivator of the soil full security for the unexhausted value of any improvement in the planting and culture of fruit which he is able and willing to carry out.

## PLANT NOTES.

### OXALIS BOWEL.

THERE are a great number of really pretty-flowered Wood Sorrels, and Kew is the only place in England where a representative collection of them may be seen. One of the very best of them is that above named. It is a free-growing plant, with trifoliate leaves 4 inches across on stalks 8 inches long; the leaflets are broad obcordate, 2½ inches across, bright green, rather fleshy. The flowers are in umbels on the end of drooping peduncles 1 foot long. There are about a dozen flowers in each umbel, each having a stalk 1½ inch long; the corolla is fully 1 inch across, perfectly circular, and coloured deep rose with a yellow eye. To grow this plant to perfection, it should be planted in a border, as it is at Kew in the succulent house, where several clumps of it have been in flower for some weeks. Probably it would do equally well in baskets. It is a plant which may be recommended as a first-rate winter-flowering greenhouse Oxalis.

### BEGONIA GERANIODES.

This has the reputation of being a small uninteresting plant, with white flowers, and a delicate constitution, and we have never seen it grown as a pot plant when it did not deserve that reputation; but when planted in a border in a warm, dry, sunny greenhouse, it is a really charming Begonia, which is saying a good deal in these days of Begonia wonders. Two years ago about fifty tubers of *B. geraniodes* were imported direct from Natal to Kew. They were planted in a border in a Succulent-house under the conditions which have been so successful with *Streptocarpus*. The Begonias are in flower now. They have kidney-shaped leaves, 6 inches across, on erect stalks 8 inches long. The flowers are on erect leafy panicles a foot high, and each flower is 1½ inch across, snow-white, with a small button-like bunch of bright yellow stamens in the middle. Each plant has quite a sheaf of blossom, and as every flower faces upwards, the effect is charming. The female flowers have five segments, and a large three-winged white ovary. These plants have been in flower about a month, and they are still very fine.

### CASSEBERIA TRIPHYLLA.

This Fern has just been added to the cultivated collection at Kew. It is quite distinct from any other Fern known to me, and it is pretty enough to be noted here. The fronds are 4 inches high, erect; the stalks virid and shining black, the blade trifoliate, each leaflet 1½ inch long, and less than a quarter of an inch wide, crenulate, deep shining green. The sori are in close rows along the margin of the segments, on the underside. The genus is related to *Cheilanthes*. The plant at Kew is a compact little tuft of fronds, and it appears to thrive perfectly in a dry, sunny greenhouse. It is a native of Brazil. *W. Watson.*

## NEW OR NOTEWORTHY PLANTS.

### CYPRIPEDIUM CÆNANTHUM, JOSEPHINE JOLIBOIS X, *hyb. gall.*

THIS comes very near to *Cypripedium cænanthum* superbum. But its flower is larger, and the staminode is quite distinct. The leaf at hand is quite of *Harrisianum* shape and is covered with rather obscure, dark, interrupted, broken bars. The bract is much shorter than the hairy, green, india-purple ribbed ovary, green with indian-purple lines and freckles. The dorsal sepal is very broad, adorned with an upper white, broad margin, with numerous india-purple veins on the light green, inferior part, and the veins are covered with darker spots of the same colour, which give a mottled appearance. Petals nearly ciliate, ligulate acute, of a pallid ochre ground colour, greenish at the base, where there are numerous roundish dark, india-purple spots. The whole traversed by ten dark, purplish-brown nerves with some short, transverse, oblique bars in the anterior part running from one longitudinal nerve to the next. Dorsal sepal narrow, shorter than the lip, with india-purple nerves outside on the lightest greenish ground, quite covered with dense short purple hairs, while inside these are but a few short lines of india-purple freckles, not surpassing the base. The lip is that of *Cypripedium Harrisianum*, very pallid, having much olive colour underneath, some light brownish-purple above, and an ochre-coloured margin around the mouth. The involved margins of the stalk have numerous light, round spots; similar ones are to be seen in the interior, covered with very numerous dark hairs. The staminode is yellow, finally light-red, rather retuse in front, with two large lateral lobes and a very small apiculus in the sinus of both.

Mr. R. Measures, of The Woodlands, Streatham, the *facile princeps* of *Cypripediums*, has raised this from *Cypripedium Harrisianum* and *C. insigne* Chantini.

There can be no doubt if we knew how near all these varieties of *Cypripedium* *insigne* stand one to another, that those children of *insigne* and *Harrisianum* should be kept under the common name of *C. cænanthum* X. I have good reason to believe that this is also the view of Mr. R. Measures. Allusion is made to a similar plant in the *Journal de la Société*

*Nationale d'Horticulture de France*, 3rd series, ix., May, 1888, p. 296. Mons. M. R. Jolibois, jardinier en chef au Luxembourg, crossed *C. Harrisianum* and *C. insigne* Chantini in 1882, and the first flower opened, after a very long period in bud, on April 15, 1888. It was dedicated to Madame Josephine Jolibois, the mother of Mons. Jolibois. I suppose it must be the same, though there is no full description given. Monsieur R. Jolibois states, that some plants have simply green leaves, while others show "les feuilles maculées," which, no doubt, refers to the darker broken bars, above-mentioned. *H. G. Rehb. f.*

### CYPRIPEDIUM ELLIOTTIANUM, n. sp.

This glorious new introduction of Messrs. Sander & Co.'s, from the Philippines is now in bloom at the St. Albans Nursery. The plant is of noble habit, resembling *C. Stoelei*; leaves bright green, from 1 foot to 15 inches long, and 1½ to 2 inches broad; the oldest stout purple-dotted sepal, over 1 foot in height, bore evidence of the presence of five flowers, but on that in bloom only two. The bracts are spatheous, and very showy, from 1—1½ inch long, whitish, with narrow chocolate lines. The 2-inch long ovaries bear handsome flowers, which call to mind the beautiful *C. Rothschildianum* and *C. præstans*, from both of which, however, it is widely distinguished. The dorsal sepal is 1½ inch wide and 2½ long, pointed, ivory-white, with fifteen dark crimson lines of various lengths; the lower sepals are similar, but smaller. The lip is nearly like that of *C. Stoelei* in colour and shape, and has the same fold on the under side; ivory-white, delicately veined and tinted rose. The petals are also white, spotted in the upper portion with crimson blotches, which run into three or four narrow lines to the points, the upper portions being wavy and ciliated, much as in *C. Sanderianum*. The staminode (unless abnormal) is narrow and curved under, as in *C. Rothschildianum*. Altogether it is a very beautiful species, which seems to embody the good features of most of its section. *James O'Brien.*

### THE GENUS POLYCYCNIS.

THIS is a highly curious little genus of Orchids, occasionally met with in cultivation, though perhaps less commonly at the present time than some years ago, when *Gongoras*, *Catasetums*, *Cynoches*, and other allied genera, were more in fashion. The rare *P. lepidus* is just now flowering in the Kew collection, thus furnishing a convenient opportunity for giving a brief account of the known species of the genus. *Polycynis* was described in 1855 by Professor Reichenbach (*Bonplandia*, iii., p. 218), the name being derived from *polys*, many, and *kyknos*, a swan, in allusion to the numerous flowers on the raceme, each having a slender, gracefully curved column, like the neck of a swan; in fact, the genus is very closely allied to *Cynoches*, the swan-neck Orchids, though at present it has not been known to play such singular freaks as producing sometimes one kind of flowers, and at other times totally differently ones, occasionally varying the proceedings by developing both kinds of flowers at once. One may perhaps say that it bears the same relation to *Cynoches* that *Mormodes* does to *Catasetum*, for *Mormodes* only produces one kind of flowers, while its more sportive relation has no fewer than three kinds, and more than once accomplished the seemingly impossible feat of presenting to Dr. Lindley flowers of two different genera on the same inflorescence—a freak which that accomplished botanist found not a little perplexing. However, we are aware of these tricks at the present day, and shall, perhaps, learn more of the history of this strange genus when some one will take in hand the cultivation of as many of the species as can be got together. Some of the species are certainly handsome, all of them grotesque, and few genera are more imperfectly known. But to return to our subject. *Polycynis* has more of the general appearance of *Gongora* than of any other genus, though its free upper sepal readily distinguishes it; for in *Gongora* the upper sepal and column are united for some distance, one appearing

to arise from the other. The flowers are numerous, and borne in long, more or less arching, or pendulous racemes from the base of the pseudobulbs. Five species have been described, from Costa Rica, New Granada, and British Guiana, and all of them have been in cultivation at one time or another. *P. vittata* was the earliest known species, having been described by Lindley in 1841, under the name of *Houllettia vittata*, from a specimen collected in the Acaray Mountains, in British Guiana, by Schomburgk, and which flowered in the nursery of the Messrs. Loddiges at Hackney.

Eight years later a second species appeared, and was described by Lindley as *Cynochos barbatum*, from a specimen sent by Linden. It also flowered the same year in the rich collection of Mrs. Lawrence at Ealing Park, this plant being the one represented in the *Botanical Magazine*. About three years later a third species flowered with the Messrs. Rollissons, having been introduced by Linden from Columbia. This was described by Lindley as *Cynochos musciferum*, in allusion to the flowers bearing a resemblance to some kinds of flies. The genus *Polycynchos* was established for the two last-named species in 1855, and a few years later *Houllettia vittata* was added. In 1869 a fourth species, *P. lepida*, was described in these columns, having been found by Wallis in New Granada, at an elevation of 6000—7000 feet above sea-level. Two years later a fifth species was added to the list, namely, *P. gratioles*, which was introduced from Costa Rica by Endres, and flowered in the nursery of Messrs. James Veitch & Sons, at Chelsea. It would be interesting to know what has become of the last-named plant, as I have never come across a specimen of it. Appended is an enumeration of the species, with their synonymy, &c.

1. *Polycynchos vittata*, Rehb. f., in *Walp. Ann., Bot. Syst.*, vi., p. 618; *Houllettia vittata*, Lindl., *Bot. Reg.*, xxvii., *Misc.*, p. 47, t. 69.—Native of British Guiana. Flowers yellow striped with chocolate.

2. *P. barbata*, Rehb. f., in *Bonplandia*, iii., p. 218. *Cynochos barbatum*, Lindl., in *Jour. Hort. Soc.*, iv., p. 238; *Bot. Mag.*, t. 4470.—Native of New Granada. Flowers light yellow, copiously spotted and freckled with brown.

3. *P. musciferum*, Rehb. f., in *Bonplandia*, iii., p. 218. *Cynochos musciferum*, Lindl., in *Lindl. and Paxt. Fl. Gard.*, iii., p. 28, fig. 248.—Native of New Granada. Flowers very similar to the preceding in colour, but much smaller.

4. *P. lepida*, Linden and Rehb. f., in *Gard. Chron.*, 1869, p. 1038; *Illustration Horticole*, n. ser., p. 100, t. 19.—Native of New Granada. Much resembling the preceding, but with the auricles at the base of the lip more developed, but straight, not curved as in that species.

5. *P. gratioles*, Rehb. f., in *Gard. Chron.*, 1871, p. 1451.—Native of Costa Rica. Said to be in the way of *P. lepida*, yet very distinct by the very short claw of the lip, and the anterior part of the same organ. Flowers brownish-purple. *R. A. Rolfe*.

#### CATTELEYA PORPHYROPHLEBIA ×, Rehb. f.

I am indebted to Messrs. James Veitch & Sons for a two-flowered peduncle of this lovely hybrid, from a plant which has just flowered in their nursery. It is derived from two singularly pure and distinct species, *C. intermedia* and *C. superba*, which unfortunately have the character of being both bad growers. The offspring is said to have a singularly good constitution, one of those seemingly inexplicable but fortunate features which has been before observed in similar instances. The sepals and petals are of a beautiful and delicate lilac, the front lobe of the lip rich amethyst-purple striated with paler purple; below this are two pale sulphur blotches, which are separated by a purple band that extends to the base of the lip. The name alludes to the rich purple veining of the lip. *R. A. R.*

### TRADE NOTICE.

Mr. A. H. JOHNSON, formerly of H. & F. Sharpe and G. & W. Yates, and for the past six years with Messrs. Carter, Page & Co., London Wall, E.C., has been appointed Manager to Mr. S. F. Armitage, seed merchant, Nottingham.

### PLANTING SAND-HILLS.

ON p. 447 of your issue for October 20, Mr. R. C. Townsend gives the results of his experience in the planting of sand-hills on the north-west coast, and calls in question some remarks of mine on the same subject in the previous issue which I sent to you in reply to a question by "Doubtful" in that of September 29. It appears to be Mr. Townsend's opinion that it is useless to endeavour to establish anything but the grasses I named on the sand-hills of the north-west, and even to do that he considers it is necessary to take much greater precautions than on the east coast, because the gales, he says, are ten times as numerous and twice as severe on the north-west as on the east coasts; also that "it is a very common occurrence to find chimney-pots, slates, tiles, and squares of glass smashed up in all directions."

Now, something of this kind occasionally happens many miles inland, and yet trees survive, and though it is a "very common occurrence" in Mr. T.'s district, yet, *mirabile dictu*, there were trees "just out in their first young leaf and looking well" at the beginning of June this year. A terrific gale then arose, and made them look "like a Scarlet Runner Bean which has had 10° of frost." I do not, however, gather from his remarks that the trees were killed, or even permanently injured, nor that they remained long in the frosted Scarlet Runner condition. He also says that the grass was turned by the same gale "as black as your hat;" but assuming that every blade of visible grass was killed, which is very unlikely, it by no means follows that the roots were hurt, or that the grass did not in the course of a very few days again become as green as grass ought to be. I imagine very many possessors of sand-hills would be very glad to get them covered with trees, shrubs, and grass, even though occasionally, and for short periods, the trees might look like Scarlet Runner Beans after 10° of frost, and the grass as black as the blackest hat that ever had a head inside it. No; it is not the wind that prevents the successful planting of sand-hills when once the shifting of the sand has been overcome, and to this extent at least I understand Mr. Townsend has succeeded. There are many plants that will thrive, though exposed to these sea breezes, that do not succeed inland at all. Mr. Townsend's failure to get vegetation to grow other than the maritime grasses before alluded to, and the common Willow, about as high as the grasses, is much more likely to be due to a want of plant-food in the sand to give the young plants a start. This want, however, in these days of concentrated and complete artificial manures, is one very easily supplied, even where it is almost practically impossible (and such places are rare indeed) to make use of any natural manures. Let "Doubtful" not be disheartened, and Mr. Townsend try again. I would by no means, however, advise either of them to put up walls to protect their young plantations on shifting sand-hills.

The first and greatest difficulty in successfully planting sand-hills has been overcome when the shifting of the sand has been prevented, and I admit that in some places this may be impossible, or, at least, impracticable. Mr. Townsend has, however, accomplished that in his district. What he has not been successful in accomplishing is in inducing a varied shrub and tree growth to thrive on his sand-hills. His letter supplies evidence that trees are not destroyed by the numerous and severe gales to which they are subjected, and that in early June of this year they looked well.

Where I am now writing—a little inland from the south coast—Japanese Eucalyptus in exposed places suffered somewhat from severe frost last winter, but on Southsea Common, close to the sea, and fully exposed to the "dreaded sou'-westers," it is hardly too much to say that on the numerous specimens of this shrub planted there hardly a leaf was injured. In some parts of Norfolk the Japanese Eucalyptus is only half hardy, but on the beach at Yarmouth and the cliff at Hunstanton and Cromer it survives the

winters without injury, although unprotected in any way. In the wind-swept Orkneys and Shetlands we are told evergreens survive the winters which succumb to frost in the Midlands of England. Clearly it is not the winds from any quarter that we have to fear in planting sand-hills, always providing that the shifting of the sand can be prevented. Why, all round the coasts of Britain, even, I have no doubt, in Mr. Townsend's own district, evidences exist that many plants and shrubs, and even trees, thrive, in spite of the winds, better in the coast districts than elsewhere. Plants, however, will not grow in pure sand either near the sea or inland, and the sand-hills of the seacoast are, for the most part, nearly pure sand. On such it is necessary, just as it is on poor sandy soils inland, to provide plant food; this done, there are plants and shrubs specially designed by Nature for thriving on them. *J. E. E.*

### THE MITCHAM PEPPERMINT AND LAVENDER CROPS.

MITCHAM, as is well known, has long been associated with the growth of perfume-yielding plants, a large extent of the ground in that part of the county of Surrey being under cultivation of plants valued either as perfumes or for their medicinal properties.

Our contemporary, the *Chemist and Druggist*, in a recent issue, stated that the Peppermint plants this season were moved instead of reaped, and some growers were using reaping-machines for the first time. Comparing the present with last year's crop after cutting, it is estimated that 1888 will prove to be a good season, but the distillers, notwithstanding, predict small yields of the stills, estimating about 7 lb. against about 9 lb. to 11 lb. last year. "But too much attention should not be paid to this fact; for although individual stills are yielding less than last season, the deficiency will, to a certain extent, be made up in the extra bulk of crop to be distilled; but this will, of course, entail some extra expense on the growers for distillation, at the same time the nett results after the whole crop has been distilled will equal last season." In the meantime higher prices are asked, namely, 30s. to 32s. 6d. per pound for the best new oil.

Lavender—the Mitcham produce of which is celebrated all the world over, the oil being of the finest quality, and fetching the highest price of any in the market—is described as bearing the largest and finest blossoms ever seen—almost, indeed, giant in size. The bloom in many parts was three times the size it was last year.

### PLANT-NAMES A THOUSAND YEARS AGO.

THE following list of old English plant-names is taken from the *Epinal Glossary*. This Glossary is supposed to be of the beginning of the eighth century, so that the list of plant names is earlier in date than those already printed in Professor Earle's excellent little book on *English Plant-Names*, in which the earliest is of the tenth century.

It should be remembered that the list does not pretend to be a complete list of English plant-names of that period. The plant-names are only a small portion (about an eighth) of the entire Glossary, and the business of the compiler was, not to give the Latin for all English words, but to give the English translation of certain Latin words which he met with in his reading, of which the greater part seems to be taken from Pliny; so that, unless he found a plant name in his Latin author, it would not come into his Glossary.

Of the philological value of such lists I need say nothing, as Professor Earle has said all that is necessary. I give the list as a matter of interest for botanical students.

I have, of course, generally given the exact words of the old writer, but in a few cases I have not thought it necessary to follow him so exactly as to give his evident mistakes. In these few cases I give

the Latin and old English words freed from what are clearly only scriptorial errors.

The words of the Glossary are first given, and then follow after each word (in brackets) the more usual form of the name, or the modern name, or the present Latin name, or all of these. The bracketed words are my own, given with a view to help those readers of the *Gardeners' Chronicle* who may require such help, and I feel sure that there are not a few of such readers who will be interested, as I am, in noting how, in this nineteenth century, we are in so many cases using the same names for our plants that were used by our forefathers more than a thousand years ago.

*abilina*—hnutu (nut)—*Nux avellana*.  
*allium*—garlic (garlic).  
*alba spina*—hægthorn (hawthorn).  
*apiastrum*—biowurt (beewort—sweetflag?)  
*anethum*—dill (dill)—*Anethum graveolens*.  
*asculus*—boece (beech).  
*aconita*—thung (monkshood).  
*apio*—merici (parsley).  
*acerabulus*—mapuldur (apple tree).  
*arifolius*—holegn (holly).  
*alnus*—alaer (alder).  
*alneum*—falac tree (black alder).  
*abies*—saeppe (fir tree? white poplar?)  
*almeta*—alerholt (alder wood).  
*alga*—war (seaweed—ware).  
*avellanus*—haesl (hazel).  
*acculula*—hramsa (ramsons—wild garlic).  
*ascalonium*—ynnelac (onion).  
*accitulum*—geaces sura (cuckoo sorrel — oxalis).  
*ambila*—laec (leek).  
*arniglossa*—uegbradae (waybread—plantain).  
*absinthum*—uermood (wormwood).  
*angustus*—breer (brier).  
*acium*—hindberie (hindberry—raspberry).  
*beta* (*betula*)—berc, *arbor dicitur* (birch).  
*blitum*—clotæ—burdock).  
*cercylus*—aesc (ash).  
*canis lingua*—ribbae (ribwort—plantain).  
*cicuta*—hymblica (hemlock).  
*corylus*—haesl (hazel).  
*cerasius*—cisirbeam (cherry tree).  
*cariscus*—cuicbeam (quickwood—hawthorn).  
*crocus*—gelu (yellow—saffron).  
*cercifolium*—cunille (chervil).  
*cicuta*—uodaeustla (wood whistle—hemlock).  
*castanea*—cistenbeam (chestnut).  
*caltha*—reade clabre vel *genus floris* (red clover?)  
*carex*—segg. (sedge).  
*cucumis*—popeg (poppy).  
*calista*—huitt clabre (white clover).  
*calcicolum*—ieces sura (cuckoo sorrel—oxalis).  
*cardella*—thistel (thistle).  
*callomachus*—haeth (heath).  
*carduus*—thistel (thistle).  
*cardanum*—lypbeorn (some medical seed).  
*cynoglossa*—ribbae (ribwort—plantain).  
*cicer*—bean.  
*cexpa*—cipae (onion).  
*carectum*—hreed (reed).  
*colchicum*—aebordotæ (carline thistle?).  
*hedera*—uoiduindae (woodbine, ivy).  
*erimio*—hindberie (hindberry—raspberry).  
*heptaphyllon*—vil jolia—gelodwyt (silver weed).  
*helleborus*—thunge—woedeburge (woodberry, baneberry).  
*csulus*, *ab edendo*—boece (beech).  
*edera*—ing (ivy).  
*edulm*—uualhyrt (wallwort—elder).  
*frastrinus*—aesc (ash).  
*fagus*—boece (beech).  
*fuarius*—uuanbeam (spindle tree).  
*filix*—fearn (fern).  
*fraga*—obet (fruit—strawberry).  
*fungus*—suamu (mushroom).  
*ferula*—aeschthotæ (giant fennel).  
*gladiolum*—segg (sedge).  
*gramen*—quica (quick or couch-grass).  
*genietæ*—broom.  
*hibiscum*—biscopwyt (bishopwort—vervain).  
*inula*—uualhyrt (wallwort—pellitory).  
*involuco*—uoidubindae (withywind).  
*lolum*—atæ (oat—tares).

*lactuca*—thusthil (sow thistle).  
*lapatum*—lelodra (sorrel?).  
*lappa*—clifæ (clivers—galium).  
*ligustrum*—huneagsuce (honeysuckle).  
*miliefolium*—gerwae (yarrow).  
*malus*—apuldur (apple tree).  
*myrtus*—wyr (myrtle).  
*malarium*—maliscapuldur (sweet apple tree).  
*malva*—cotuc vel gearwan leaf (yarrow leaf mallow).  
*marrubium*—huno vel biowurt (honeywort—beewort).  
*nux*—hnutbeam (nut tree).  
*nigra spina*—slachthorn (sloe—blackthorn).  
*nasturtium*—tuancressa—leccressa (garden cress).  
*origanum*—uormillæ (wild marjoram).  
*origanum*—elonaæ (elecampane?).  
*populus*—birciae (birch).  
*plantago vel septineræ*—waegbradae (waybread—plantain).  
*pastinaca*—uashlmoræ (turnip).  
*papirum*—eoris (water rush, bulrush).  
*paliurus*—sinfullae (always full, or perfect—generally given as the translation of *sempervivum*).  
*prunus*—plumæ (plum).  
*papaer*—papaeg (poppy).  
*pastellus*—huneagaep (honey-apple).  
*quinqefolium*—hraefnesfot (raven's-foot—crowfoot).  
*quinqueræ*—leciuyurt (leechwort, plantain).  
*robur*—aac (oak).  
*ruscus*—cnioholaen (knee holly, butcher's broom).  
*ramnus*—thebauthorn (thief thorn, buckthorn).  
*salix*—salch (sallow, willow).  
*sambucus*—ellæa (elder).  
*scirpus de qua matta conficitur* (bulrush).  
*serpillum*—bradae leac (broad leek).  
*sinapis*—cressæ (cress).  
*scilla*—gladinæ (gladwyn).  
*spina alba*—haegthorn (hawthorn).  
*spina nigra*—slagthorn (sloe thorn).  
*scirpa*—eoris (water rush).  
*salsa*—suræ (sorrel).  
*sinfonia*—belonæ (henbell—henbane).  
*sencio*—gundaesweligæ (groundsel).  
*tilia*—lind (lime—linden).  
*taxis*—iu (yew).  
*trunulus*—aespæ (aspens).  
*thymus*—haeth (heath).  
*tilia*—lind vel baest (lime or bass).  
*talumbus*—giscaduuyrt (rocket?)  
*volvula*—herba similis hedera, que vitibus et frugibus circumdari solet—uudubinde (woodbine).  
*veneria*—smerwuyrt (smerewort—plant intended uncertain).  
*ulmus*—elm.  
*riburnia*—uuidubindae (woodbine).  
*viscus*—mistel (mistletoe).  
*vicia*—fageas bean (fowl's bean—chickling vetch).

Henry N. Ellacombe.

## THE APIARY.

### GENERAL HINTS.

THOUGH we have had some sharp frosts at night, many days have been mild, and the bees have not only had some good flights, but we have even seen some of ours bringing in pollen, which shows breeding is still going on to some extent. While the weather is moderately mild and open, the final packing for winter need not be done; in fact, it is better not to do it, but to allow the bees to form themselves into a cluster through cold, and then when real cold weather is upon us, to cover up for the winter. When doing so, see that covers are firmly fastened on, and made water-tight. Our honey-extractor has had a rest this summer, and therefore does not require putting away, but all things not required now must be stowed away in a dry place.

Old combs not wanted again for the bees may be melted down. It is worse than useless to keep them, as they turn musty, and decrease in weight. There appears to be a desire on the part of many bee-

keepers to return to the old copper for extracting wax. I have never dissented from the use of it, and cannot feel feeling pleased at its return to favour. The usual plan is to put the comb into a bag, put it in a copper full of water, and boil gently, taking care to hold the bag down with something. There is, however, a much better method of doing it in a copper by means of a very simple and useful contrivance which any handy man could make for himself, or his nearest tinman could do it for him.

### BEE FOONS.

When planting bulbs do not forget a few Crocuses and Snowdrops for our pets. Another plant is calling for our notice. It comes from America, as a matter of course, so we are going to try it before recommending it largely. It is a member of the Teasel family, and the Americans say thousands of bees visit it in a very short time. We wonder ourselves how they count the bees. In Russia it is said if you want a genuine opinion, ask six people for one, strike an average, and then believe the opposite. As far as American recommendations are concerned, we have better opinions; still, it is safer to try an experiment on a small scale first. If successful, it would show our prudence, while if unsuccessful it would look like a prophecy, according to the immortal views of the immortal Vicar of Wakefield. *Bee.*

## SHREWSBURY AND NEIGHBOURHOOD.

A GREAT number of persons (42,000) visited the last horticultural show at Shrewsbury on the second day. Few English towns possess greater interest to visitors than Shrewsbury in its historic associations, which are numerous and varied.

Considered also from a horticultural point of view, Shrewsbury contains several places of note, to a few only of which we can refer on the present occasion, our notes having been taken at the end of August.

ONSLOW HALL was the former seat of the ancestors of the present Earl of Onslow; the present occupant of Onslow Hall is Colonel Wingfield.

The estate consists of 3800 acres of very good land. The pleasure ground is about 9 acres, with a first-class collection of new sorts of Rhododendrons—plants in which the Colonel is much interested. These are a long time in getting used to the soil after coming out of peat, but grow well when once established. Oaks, Elms, and Larch we noted as doing well.

On the lawn is a magnificent example of the variegated Sycamore, which Mr. W. Barron, of Borrowash—no mean authority on such matters—thinks must have been one of the first planted in England, and that it is one of the finest trees known to him. Eleven large clumps of Pampas-grass standing on the lawn were a very conspicuous feature.

Amongst plants in the houses we observed a good collection of Ferns, and a few of the most useful Orchids. We noted also a nice collection of Dracenas. Plants suitable for table decoration are largely in request, and are surprisingly well done. About 600 Chrysanthemums are grown, and these will doubtless give a good account of themselves later on. A good batch of Bouvardias will be useful soon.

Three Peach-houses, 70 feet in length each, were well utilised, one (hip-roofed) being a very useful house; half-way up the house (in front) are Mârchal Niel Roses, trained to a trellis. These bloom well here, although every year as soon as the plants have ceased blooming, they are cut down, and made to break afresh from the bottom. Then Tomatoes are planted, and by the time these have been fruited and cut the Roses have joined each other again, one strong shoot being trained along each wire. Strawberries are grown overhead, and Peaches and Nectarines on the back wall. There is an iron trellis along the front for bedding plants.

The two other houses are filled with Peaches and Nectarines on the back wall, and are nearly all young trees. Alexander Peach has given some fine early

fruit. Royal George and Grosse Mignonne are considered two of the best. A-ber is found to be rather a shy bearer. Nectarine Peach is a good late variety, and hangs a long time after ripening. Several other sorts are grown, but those named have proved themselves to be the best.

Peaches outdoors are carrying good crops, but on account of the sunless season it is feared the fruits will not ripen. Amongst Nectarines, Humboldt and Pine-apple are the most favoured sorts.

At the end of this range is one of the oldest *Maréchal Niel* Roses in England. An account of it appeared in this journal some six or seven years since, but on account of building operations, its roots were obliged to be cut and confined to a small space, so that this old favourite is not now seen in its former splendour.

We noted some good Muscat Grapes, that deserve more than a passing notice. The Vines are about thirty years old, and two years since Mr. John Lambert, the gardener lifted them. Their roots were tied up in damp mats for two days and nights, in order to put in a new bottom to the border. Nearly all the old Vine border was used again, fresh cut loam being unobtainable. In the Muscat class at Shrewsbury show this year, Grapes from these Vines secured Mr. Lambert first honours, showing, therefore, the complete success of the operation.

Pears are a favourite fruit, a good collection being grown. Young cordons are kept, being planted in preference to trained trees on walls.

Vegetable culture is well carried out here, Mr. Lambert gaining the much-coveted Veitch Memorial Medal and prize of £5 at Shrewsbury, thirteen competing in the class. He has also taken the 1st prizes in the vegetable classes at Liverpool for seven years. Gardeners in Proud Salopia, as it is called, have not such a "rosy" time of it as those in the South; indeed, with them it is often a case of gardening under difficulties. Carrots, Parsnips, and such roots are fully three weeks later here than in the South.

Mr. Lambert says the present season has been the most trying he has ever experienced. Peas sown for Shrewsbury show are now (end of August) only in bloom. Autumn Onions appear to have been treated too kindly, for ninety out of every hundred are double-necked. The plantation of Autumn Giant Cauliflowers, that should have been just ready for Shrewsbury, and which, under ordinary circumstances, would have been quite as large again as the ones comprised in the Medal Collection, were attacked by maggots at the roots, and so turned in three weeks before the proper time. It may be added, that the kitchen garden is nearly 4 acres in extent, some of it (recently added) is rough, subsoil clay, with about 2 feet of rather stiff loam.

In the neighbourhood of Onslow is a somewhat remarkable Oak, called Glendower's Oak, famed by the tradition that it afforded in its branches an observatory to the Welsh chieftain, Owen Glendower, to ascertain the issue of the Battle of Shrewsbury in 1403. Though now hollow and decayed (only one small branch being at present alive), it girths upwards of 44 feet. This aged monarch in the tree way stands in the grounds of Shelton Priory, Colonel Field's residence, in which there is a good tree growth. From this point several fine views of the town may be obtained.

HAWKSTONE.—Unfortunately (our time being somewhat limited), we were unable to visit this, the seat of Lord Hill. Mr. Lambert, however, is an old Hawkstone man (having learned his business under that good all-round gardener, the late Mr. Daniel Judd), and informed us that it contains one of the prettiest parks in England, a nice lot of plants are grown, and fruit is done well. There is a fine kitchen garden (walled in) of 4 acres. The present chief of affairs horticultural, is Mr. Carr. What is called "Lord Hill's Column" in Shrewsbury deserves notice. It is situated in a most commanding position, at the top of Abbey Foregate. It was erected by public subscription, at a cost of £5973, to commemorate the glorious victories and well-earned laurels of a Shropshire hero and patriot, General Lord Hill. The column was designed by the late Mr. Edward Haycock,

architect, of Shrewsbury. It was completed on June 18, 1816, the anniversary of the Battle of Waterloo. The statue of his lordship is 17 feet in height, the total height of the column from the base to the top of the statue is 133 feet.

Whilst in the district, we took a trip to Alton Towers, Staffordshire, the princely seat of the Earl of Shrewsbury and Talbot. Our notes concerning this fine place must be reserved for publication in a future issue. *B.*

## SPECIMEN TREES IN KEW GARDENS.

THE PERSIMMON.—The tree herewith figured (fig. 72, p. 505) stands close to the Temple of the Sun in the Royal Gardens, Kew, not far from the principal gates on Kew Green. It is one of the original denizens of the Kew Arboretum, and, in all probability, is one of the numerous trees presented to George III. by the then Duke of Argyll, "which he had imported and propagated in his garden, at Whitton, near Hounslow." The Temple of the Sun was nearly the centre of the original botanic garden—a walled-in space of about nine acres, planted and arranged by William Aiton.

The Persimmon (*Diospyros virginiana*) is a native of the Central and Southern United States, and has long been known in cultivation in this country,

FIG. 71.—BARK OF THE PERSIMMON.

having, according to London, been introduced in 1629. The following are the measurements of the Kew specimen which, according to many American botanists who have seen it, is a remarkably fine one:—Height 60 feet, spread of branches 38 feet, girth of trunk at 4 feet from the ground 5 feet 2 inches. The trunk has no branches for about 15 feet, and the deeply-fissured bark renders it a decidedly handsome object.

There are only half a dozen genera in the order Ebenaceæ, and about 250 species, the genus *Diospyros* embracing no fewer than 153. Nearly all are natives of warm regions, and a number furnish economic produce of considerable importance. Ebony, so well known on account of its extreme dark colour and hardness, is the heartwood of the Ceylon, *D. ebenum*. One of the most beautiful of all cabinet woods is that of *D. quæssa*, another Cingalese tree; this is so hard that edge-tools can scarcely work it. The fruits of most of the species are very astringent, and many are used medicinally. From the unripe fruit of *D. virginiana* an indelible ink is made in the Southern United States.

In his *North American Sylva* Michaux makes the following statement which is of interest historically in connection with the Persimmon:—"In an ancient periodical work printed at Philadelphia, I find that the English Government, in the years 1762 and 1763, offered a premium of £20 sterling for every 50

pounds of gum collected from the Persimmon in their American colonies. They were doubtless misinformed on this subject; a greenish gum without taste or smell exudes from the tree, but, in several hundred experiments, I have not been able, by wounding the bark, to collect more than two scruples from a single stock."

*D. virginiana* much resembles in general aspect *D. Lotus*, the European Date Plum, but differs from it by the male cymes and female peduncles being rather longer, and by the larger flowers and fruit. I have not seen fruits of the Persimmon produced in England, but have met with specimens fruiting abundantly in several parts of France. The Kaki or Chinese Date Plum, is not hardy enough to withstand the English winters or to ripen its wood sufficiently to bear its handsome fruits; it can, however, be grown as an orchard-house plant. Many curious forms—widely differing in the colour and shape of the fruits—are cultivated in the South of France and—apart from the value of the fruits themselves—make very beautiful bushes. The figure is from a photograph of Mr. W. G. Smith. *G. Nicholson.*

## THE BULB GARDEN.

### DAFFODIL LIFTING AND PLANTING.

I HAVE read with much interest all that has been said on this subject, and with some of the remarks I thoroughly agree. As regards the annual lifting, I do not agree, and would not practise it unless forced to do so by the soil being very light or very heavy. Most certainly, were all our summers like the wet one of 1888, the delicate sorts like *pallidus præcox*, Henry Irving, General Gordon, Lincoln Yellow, and many of the white trumpet or "swan's neck" section, would be better by being lifted and dried, and not replanted until September. But with strong growers, like Trumpet Maximus, Golden Spur, Princeps, Horsfield, Emperor, and Empress, if the soil be suitable, and they are planted on the three years' system, I should let them remain.

Ard Righ, Blondin, Tenby, and particularly Henry Irving, which has got such a very thick skin, should be annually cleaned; the others may remain in well prepared beds for a couple of seasons if the alleys are deep. The whole matter of annual lifting very much depends on the soil and the situation, and, with us in Ireland, the characteristics of the months of May and June. If these are wet months the bulbs are apt to suffer while in the dormant state. Take the case of all the "spurius" class, notably Ard Righ, the foliage of which is quite withered by May 20, if there is much rain during the summer until vegetation again sets in—I mean root-action—which generally commences in September, there is great danger that such a bulb may rot in soils that are heavy and cold. If the bulbs are not lifted in time and dried the bloom will be of indifferent quality—what we call sick or blind bulbs—I mean such as throw up one or two stunted leaves, and make an attempt at flowering at the surface. These are generally bulbs that were water-logged during the previous summer through defective drainage or retentive soil. Bulbs pierced by the Narcissus-fly, and having the grub in them, will also exhibit this stunted growth, and they do not recover.

In the case of the water-logged bulbs, if these are lifted at once and put in the sun to dry off, well cleaned afterwards, and if the base of the bulbs (quite brown, as if scalded) be trimmed with a sharp knife until this skin is cut away and the bulbs carefully planted on a dry border, they will recover. This season, among some English bulbs, and especially with Dutch ones, water-logged, badly ripened bulbs are more observable than I have before observed, and it is only the trumpet and incomparabilis sections, whilst dormant, that show apparently "scalded buds." I have never observed it in the *Tazetta* or poetica sections, and would like to hear from a grower of Mr. Walker's experience, whether he ever had a "sick" stock of poetica ornatus or majalis. And why? For this very good reason, that their growth is active during the summer, when the others are at rest; and though late to flower and

ripen, become active again at the roots simultaneously with the trumpet varieties in September. One very good rule to go by in annual lifting of Narcissi is the state the bulbs are in during the month of July. If, as Mr. Burbridge would say, they are like cricket-balls, without a vestige of foliage or roots, there is danger for such a section of Narcissus if the soil

which we take all the top layer of soil, and on this account the beds are well drained; and in the alleys we grow Cabbages, Cauliflowers, Broccoli, and early Potatoes of dwarf growths; and in this way the soil gets manure without the latter coming into contact with the bulbs; and where the beds are this year, the alleys will come at the next lifting. What I have attempted to write on this subject is only for market

FIG. 72.—THE PERSIMMON (*DIOSPYROS VIRGINIANA*) AT KEW. (SEE P. 504.)

be badly drained, and I would say, "Lift, dry, clean, and do not plant until September." But in the case of the poeticus and Tazetta section, and many of the trumpets, strong growers like maximus, that grip the soil deeply with fleshy white roots, there is less danger, and these may be allowed to remain in the ground for two and three years. Most certainly with me the strong flowers do best, and the blooms are much finer, by being left in the soil. The beds here are 4 feet wide, with alleys 18 inches wide, and from

growers and bulb-dealers. In the case of amateurs who plant Daffodils in beds and borders, they had better lift all their choice bulbs annually as the foliage dies off, and plant again in September—for this reason: in such beds and borders bedding plants may do much harm by the water needed for these plants being unnecessary for the bulbs, as also the manure employed, as in the case of tuberous Begonias, &c. William Baylor Hartland, Temple Hill, Cork.

## ORCHID NOTES AND GLEANINGS.

### VANDA CERULEA.

ON a small plant of this handsome Orchid at present flowering with me is a spike of ten flowers, the bottom bloom of which has five sepals, three petals, and two lips. Is it a common occurrence? [Probably the result of the union of two flowers. Ed.] Individually the flowers are very fine, measuring 4 inches across, and the one with extra sepals and petals measures over 5 inches, of a lovely pale blue. We have been growing the above plant with another also in bloom at the coolest end of the stove, having failed to flower them for three years previously in the Cattleya-house; although the plants were treated in every respect the way that is generally recommended, viz., suspended close underneath the ventilator in the Cattleya-house, where they could get a fair amount of sun, and air was also admitted by a hole being cut in one of the squares, but of no use. The plants left in the Cattleya-house are at present showing no signs of flowering, and will in future be grown in the stove. *Erin.*

### ONCIDIUM BIFOLIUM.

Hitherto this plant has been rarely met with in gardens. It is a handsome dwarf-growing species, having ovate dark green pseudobulbs and short lance-shaped keeled deep green leaves, borne in pairs. The slender scapes proceed from the base of the bulbs, and bear beautiful pendulous racemes of from six to twenty showy flowers, and the sepals and petals are brown faintly marked with yellow. The lip, which is extremely large, is yellow of great brilliancy. Providing water is kept off the flowers, they last a long time in perfection. It is of easy culture, succeeding well upon a block horizontally suspended, with a little sphagnum to retain moisture (of which it enjoys a liberal supply), and hung at the cool end of the Cattleya-house. A plant is now flowering at the Vineyard and Nurseries, Garston. *F. A.* [The recent importations of the plant will make it a little less rare. Ed.]

### LEPTOTES BICOLOR.

A large number of this species is now flowering at the Vineyard, Garston. It is a decidedly pretty epiphytal plant, with short rush-like leaves, and bears white flowers blotched on the lip with purple. It is a desirable plant, inasmuch as its flowers appear in winter, and last a long time in perfection. It is of easy culture, succeeding well upon blocks or in pans suspended from the roof at the cool end of the Cattleya-house, and enjoys when growing a liberal supply of water. It is recorded that this species bears fragrant fruit with the odour of the Tonquin Bean (*Dipterix odorata*). This fruit, infused in cream, gives it, when iced, a mild agreeable flavour, sweeter than vanilla, but less penetrating.

### LELIA RUSSELLIANA.

This is a very distinct and elegant variety of the purpurata section. The flowers are large, the sepals somewhat narrow, and white, suffused with lilac; the petals broader, and the lilac slightly deeper in tint; the lip is large, of rosy-lilac; and has a band of pale rose near the throat, which latter is light yellow pencilled with rose. A nice plant of it is now flowering in the Vineyard Nurseries, Garston. *F. A.*

## FRUIT REGISTER.

### PEAR CLAPP'S FAVOURITE.

THIS fine American Pear is not over-estimated by "R. D." in his note in the *Gardeners' Chronicle*. It is grown here on trees in pots, and on a south wall, since it was first distributed; and when grown fully exposed to the sun, and well ripened, it is one of the most beautiful Pears with which I am acquainted, being of pleasing outline, and having a yellow ground colour, suffused and streaked with

bright crimson on its sunny side, reminding one in this respect of a well-finished Thames Bank Peach. The length when well grown is  $4\frac{1}{2}$  inches, and  $9\frac{1}{2}$  inches in circumference. The flavour is sweet and agreeable, and it is pleasanter to my taste than the musk-flavoured Williams' Bon Chrétien or Souvenir du Congrès. As "R. D." remarks, it deserves a place amongst early market kinds; it is also a good exhibition fruit, but should be planted in private gardens only in limited numbers, as, like most early Pears, it has but a short season. *T. Coomber, Hendree Gardens.*

#### CHANCELLOR PEACH.

This fine late Peach does not appear to be grown so much as it deserves to be. It comes in about the same time as Barrington and Princess of Wales. This year I gathered my last dishes of the latter and of the former on the 15th and 17th ult., and of Chancellor two days later, all the trees being on south walls. It is a robust-growing and very free-bearing variety. The fruit is large and of a roundish-oval shape, the skin being somewhat downy, and of a uniformly dark crimson next the sun; the flesh is a pale yellow, melting, very juicy, rich, and vinous, *H. W. Ward.*

#### A FEW GOOD PEARS.

*Beurré d'Ananias.*—This fine early autumn Pear should find a place in every garden. The tree is a very strong grower and prolific bearer, succeeding almost in any kind of soil, situation, or form, but, as a matter of course, doing best in a good loamy soil, and trained against a south or west wall; it also does very well as a standard. The fruit is large and obovate, the skin being greenish-yellow where shaded, tinged with brownish-red next the sun, and liberally sprinkled with russet. Flesh yellowish-white, buttery, melting, and rich.

*Doyenné Boussoch.*—This is a large handsome Pear, not often met with in gardens. It ripens in September and October, according as the district and season are warm or cold. The fruit, as already stated, is large and handsome, pyriform, having a russet skin, reddish-brown next the sun. The flesh is juicy and refreshing. It is a good grower and a free bearer; and, by reason of its taking appearance it is an excellent exhibition Pear.

*Josephine de Malines.*—Too much cannot be said in praise of this very hardy, free-bearing, and excellent Pear. The fruit is of medium size, perfumed, and of delicious flavour; and it is in season from February to April. It succeeds in any form or situation, in ordinarily good soil, on the Quince stock.

*Durondau.*—This is another excellent Pear, well worthy of extended cultivation, on account of its great fertility and hardy constitution, as much as by reason of its large and handsome fruit, which is of a rich russety brown colour and delicious flavour. *H. W. Ward.*

### BELTON PARK, GRANTHAM.

#### [SEE SUPPLEMENTARY SHEET.]

THIS, the Lincolnshire seat of the Earl Brownlow, is charmingly situated about  $2\frac{1}{2}$  miles north-east of Grantham. The mansion is a magnificent stone building; in fact, it is one of the finest in that part of the country. On the north it is bounded by the small but picturesque village of Belton, while to the southward extends a fine park containing some magnificent timber, and well stocked with fallow deer. Elm, Oak, and Ash, apparently do exceptionally well, there being some of the finest specimens of these possible to see. There are several approaches to the mansion; the principal one is a straight road, upwards of a mile in length, leading from the south side through the park. To each side of this, at a distance of about 60 feet, extends a magnificent avenue of Elms the entire length.

On the right, leading to the mansions, are some picturesque ruins known as "The Villa," in close

proximity to which is a fine sheet of ornamental water. On the same side, but more northward, is a fine tower, and some more ruins generally known as Belmont. Leading to this from the mansion is a fine avenue of Limes nearly a mile in length. Many of the trees are a special variety, being smaller in leaf than the ordinary kind, and a later and more profuse bloomer, inasmuch as at the time of our visit (the end of August) they were in full bloom. The other side of the Park is skirted by the river Witham which runs through a portion of the pleasure grounds near to the mansion, and affords a charm which is seldom obtained from artificial lakes and streams. On its banks conveniences are erected, which give an adequate supply of water to the establishment in the driest of seasons—a most important thing in large gardens.

#### THE PLEASURE GROUNDS.

As might be expected in so fine an old place, are laid out in a very choice manner. Many grand specimens of Beech, Oak, Plane, and Elm stand prominently about, and amongst them, and in groups, evergreens, shrubs, and smaller-growing trees; thus adding to the naturalness of the garden views. Several fair specimens of *Sequoia gigantea* (Wellingtonia) were noticeable, though, from some cause, this fine Conifer does not grow with much luxuriance; *Cedrus Deodara* does better—but the chief features are Box and Yew. Of the former there are many fine groups and single specimens, with stems of remarkable size.

The walks are designed in that picturesque and natural style which is characteristic of good landscape gardening. One part of the pleasure-grounds, known as the "Wilderness," is so remarkably well arranged that it deserves more than a passing notice. Through this part the River Witham winds, and the Box and Yew grow with remarkable luxuriance. With several fine specimens of the latter, however, a most singular fact occurred several winters ago, viz., the severe frost killed them outright. One of them was measured, and the stem at 2 feet from the ground was found to be upwards of 6 feet in circumference. Here also are fine clumps of *Spiræa arifolia*, and not far distant are seven or eight remarkably fine weeping Beeches. At this point there is a bend in the river, which is here spanned by a rustic bridge, whose sides are covered from the water's edge nearly to the top with Honeysuckles, Clematis Jackmanni, and Tropæolum majus. The two last named were a mass of bloom at the time of my visit. The plants, I may mention, are grown in boxes placed on each side of the bridge; these, however, are hid by masses of Periwinkle, which, when in flower, is also effective.

#### THE FLOWER GARDEN.

The principal part of this is as shown in the illustration (see Supplement), which depicts it as seen from the central steps in front of the mansion. As a rule summer bedding is not extensively done, inasmuch as the spring bedding is the principal feature here. The centre bed, part of which can be seen on each side of the walk, are usually planted with Crown Imperials and Wallflowers, with a broad edging of Pansies. The long narrow beds which run parallel with the walk are generally planted with Tulips, Hyacinths, &c., each colour being planted in sections, and various designs carried out. This, with a groundwork of Myosotis, Aubrietias, Arabis, Violas, &c., is very effective. The small beds are also planted in a similar manner. To give an idea of the extent to which spring bedding is practised, it may be stated that nearly 20,000 Pansies of various sorts are grown annually, the principal kinds being Purity, The Tory, Cloth of Gold, Blue King, and Cliveden Blue. In each corner of the flower garden are some fine specimens of *Acer Negundo variegatum*, two of which may be seen in the illustration.

#### THE HOUSES.

The houses principally devoted to plant culture are near to the flower garden. A fine conservatory is well filled with climbing and other plants, Camellias forming a great feature here. Ficus repens

luxuriates on the back wall, as also does *Asparagus plumosus nanus*. Another house is filled with healthy plants of Azaleas, Camellias, and other hardy wooded subjects, and a stove containing miscellaneous foliaged plants and Ferns. A remarkable feature here is a fine plant of *Poinsettia pulcherrima* planted out in the border, having a stem nearly as thick as a man's arm.

Orchids, though not extensively grown, were looking well, and comprised a nice collection of *Celogyne cristata*, *Vanda tricolor*, *Cypripedium insigne*, *C. barbatum*, *C. Lowi*; *Calanthes* in variety, and others; and in the same house are several seedlings from *Anthurium Andersonii*, raised by Mr. Sage, the able gardener. Close by is a house well stocked with table plants, of which large numbers are required, and a fine specimen of *Davallia Mooreana*. A similar house is devoted to Ferns for cutting purposes.

There are seven fruit-houses—four vineries, two Peach-houses, and a Fig-house; they are in the kitchen garden, at some distance from the house. The Vines looked remarkably well, and bore fine crops, which, as a whole, were beautifully coloured, the Hamburghs, Alicantes, Lady Downes, and Madresfield Court especially. Muscats also were good, those grafted on the Alicante stock being, however, decidedly the best. A novel feature in Grape culture (for which, by the way, Mr. Sage is the recipient of a Silver Medal from the Royal Horticultural Society) is to be seen, and consists of fruiting canes in 7 and 8-inch pots for table decoration. Peaches and Nectarines are well done, the principal varieties being Barrington and Pine-apple. Figs are exceptionally good, there being a fine house devoted entirely to Brown Turkeys. Numerous heated pits, &c., are devoted to the culture of Melons, Cucumbers, &c., and Tomatoes are largely grown on the extension system. A fine batch of Strawberries for forcing, comprising some 2500 plants, was also noticeable; likewise a healthy lot of Chrysanthemums and pot Roses, which are largely grown for cut flowers. An immense quantity of Marie Louise, Count Brazza, and Neapolitan Violets are also grown.

#### THE KITCHEN GARDENS.

are very extensive and divided into several walled-in compartments, each upwards of an acre in extent, thus there is every facility for the production of good fruit and vegetables. The south walls are devoted to Peach and Apricot culture. The other walls are principally devoted to Pears, Plums, and Cherries; Apples, as in most old gardens, are principally well-established standards, which in some seasons carry exceptionally heavy crops. This year has, however, proved an exception, for, generally speaking, the fruit crop, with the exception of small fruits, is but indifferent. Of Apples, the principal varieties fruiting this season, are Lane's Prince Albert, Ecklinville, Lord Suffield, and Herefordshire Pearmain, the first named being considered the best all-round variety for that locality.

Vegetables are well grown, especially Peas, Brussels Sprouts, Scarlet Runners, Celery, and Asparagus—this last being grown extensively for forcing, in order to keep a supply from before Christmas until the outdoor season commences. Another feature is the extensive planting of the Rosette Colewort. These are liberally planted upon south borders. The foregoing will suffice to form a conception of the magnitude of this old place, and the able manner in which it is managed by Mr. Sage. Our illustration is reproduced from a photograph by Mr. H. J. Bliss, of Grantham. C. C.

### PLANTS AND THEIR CULTURE.

ERICAS.—In garden parlance these are classed into two groups, the hard and the soft-wooded respectively, and for garden purposes this division is useful, as it broadly divides the summer and the winter-flowering groups; Hyemalis and Willmoreana being typical of the soft-wooded or winter-flowering group, and Aitonica, Victoria, the many beautiful varieties of tricolor, and ventricosa, the summer-flowering groups. Between the two extremes there are species which practically unite the two flower periods.

Ericas may be had in flower all the year round, and, when they are well done, few plants are more attractive. Unfortunately some Ericas are regarded by the craft as "miffy," requiring an extraordinary amount of skill to grow them well, and certainly some of them are benefited by special treatment; but I have found that where a common-sense sort of management fails extraordinary measures do not avail much. A frequent cause of failure results from mixing them up with other plants which overshadow and thus rob them of a large share of the light, and there is not that amount of ventilation so necessary to their well being. The summer-flowering section will now be placed in their winter quarters, and if no Heath-house is found in the garden, it will be found best to arrange them in a group by themselves in the lightest, airiest position, in a cool greenhouse. In this way they are more under command than if scattered about. Some diversity of opinion exists as to the best season to pot Heaths, but, all things considered, from now onward to early spring is the best time for the operation, as by doing it during that period it makes a better division of labour than when deferred entirely to the spring, when so many other plants require potting; moreover large Ericas with many sticks take a longer time to pot, and train, than other plants. It must not be forgotten also that South African plants have a growing in our autumn, i.e. being their native spring time. Indeed, I have only seen the very best results attained when early autumn potting has been the rule, and this is especially the case with young plants; and it is surprising how much more is gained by this ordering of the work.

In potting, use clean pots, with clean crocks well placed, good turfy fibrous peat of firm texture, coarse clean silver sand, and, if procurable, nodules of white sandstone, and all of these should be in readiness before commencing operations. It is important that the compost be nicely moist without being wet, as it may then be rammed firmly into the pots without any risk of its becoming close, and subsequently sodden. See also that the ball of the plant to be potted is moist throughout before turning it out. Remove the crocks from the ball and any loose soil, but otherwise keep it intact. In placing it in the new pot leave sufficient space for thoroughly watering it, but do not plant deeply—only just low enough to admit of the sprinkling of new soil being put on the top of the ball. After potting very little water will usually be required until the spring, but if through any cause it should be required, give a good watering, and give no more until the soil be again dry. Plants which do not require potting should have all the dead and decayed portions cut out, and the stakes should be put in order. The foregoing remarks also apply to Apelexis, Phacocoma, and Dracophyllum, as well as to all young stock of soft-wooded Ericas.

**Propagation.**—The present season offers advantages for putting in cuttings of many tropical plants which have just completed their growth, or at all events in which it is less active, and consequently more consolidated, as the cuttings can now be more freely exposed to the light, and without having recourse to much watering. Another point of importance is that cuttings put in now get established by the close of the year, and are ready to push on when the days lengthen, and every plant grower is fully alive to the advantages of the early start.

At the present season many things may be rooted of the full size required, and this brings them into small pots, and which may therefore be employed for various indoor purposes, without turning them out of their pots; such are Crotons, Dracenas, Cordylines, Dieffenbachias, Acalyphas; any of these may, with ordinary care, be rooted without the loss of a leaf, or their making any fresh growth. In putting such cuttings into the cutting case their leaves should be carefully tied up. Then there are another class of plants which although truly stove perennials, are more satisfactory when grown as young plants, and of these *Cynophyllum magnificum*, *Sphaerogyn latifolia*, *Miconia feruginea* may be noted as typical examples. These are most admired when grown with straight stems, having fine leaves down to the rim of the pot; and this is easily done by having small young plants to start with in the spring; cuttings of these are not quite so easily rooted as the first-mentioned plants, still, cuttings and small bits of the stems may be rooted, if the buds of the pieces chosen have a leaf attached to them. A moist warm sand-bed is the best place for them, but where this does not exist the same conditions are attained by potting the cuttings in moist sand, and plunging the pots in a bottom-heat of about 80°–85°. As soon as a few roots are

formed, pot off, using at first a light rather sandy compost. At all times strive to prevent them from flagging by regulating the damping and airing. Always remove at once any decaying part of the leaves, should any occur. *F. Ross, Pendell Court.*

## THE HARDY FRUIT GARDEN.

**PLANTING.**—Autumn is the best time of the year for planting fruit trees, providing the soil is of a dry warm character, but when the soil is clayey, and consequently somewhat cold, planting had better be deferred until the early spring time. Much waste of time may be spared if the planting contemplated is considerable, by having the digging of holes and the preparation of the soil finished in advance. For immediately surrounding the roots a soil such as that recommended in a former Calendar for use in transplanting trees will be the proper material to employ; it being a great point to mix some fresh soil, if only about a barrowload, to the staple when planting. The fruit quarters, fruit wall and orchard, should be examined, and all worn-out or worthless trees grubbed out, being careful to leave no pieces of roots in the soil, these being fertile sources of disease in living roots at a later period. The holes should then be dug out with upright sides to the depth of 2 feet, thoroughly breaking up the subsoil; the holes should not be less than 6 feet in diameter. I assume that the drainage of land in gardens and orchards is in proper order, and unless that is so the trees will not make satisfactory growth. If the subsoil be of a wet nature it is in any case advisable to dig it out to the depth of 2½ feet, afterwards to tread the bottom firm, and then place a layer of brickbats or stones rammed hard, and over this a layer of coal-ashes made firm, and on this again whole turves should be placed. Ordinarily this will suffice to keep the roots from descending into the subsoil.

The following information may be useful to many, and it also describes the way in which the kitchen garden here is planted. All round the vegetable quarters by the side of the walks are borders 6 feet in width, down the centre of which dwarf pyramids and bushes of Apples, Pears, Plums, and Cherries are planted. These are between 7 and 8 feet apart. The Apples are worked on the Paradise and most of the Pears on the Quince stock, a few only being on Pear stocks. With the exception of Cherries all are kept within bounds and from overcropping by summer-pinchings, also by periodical lifting and root-pruning, which does away with a great amount of winter-pruning. The roots of all are encouraged and kept near to the surface by annual mulchings. The average height of the trees is 7 feet, so that it may be seen that the vegetable quarters are not unduly shaded, and that the gathering of the fruit gives but little trouble.

Plum trees grown in this way I find are best lifted every fourth year—this prevents the formation of gross shoots and induces abundance of fibrous roots, and it keeps them in a fruitful condition. The small bush fruits are grown on separate quarters for the convenience of netting them in summer. *A. Ward, Stoke Edith Park.*

## FRUITS UNDER GLASS.

**PINES.**—Any of these swelling their fruit should be kept at a temperature of 70° on cold windy nights, and 75° on mild ones. In order to do away with the need of hard firing, some kind of covering should be put over the roof-glass in the evening and removed at daybreak; this will prevent the escape of much of the heat, and the condensation of the internal moisture on the glass. The more fire-heat that is applied must be met by a corresponding increased amount of moisture in the house, in order to maintain a healthy state of the atmosphere. Syringing must now be confined to the stems of the plants underneath the foliage, and to damping the surface of the beds and the paths. Water at the time must be cautiously done, as too little will lead to premature ripening and want of juiciness, and the put will be stringy; too much water, on the other hand, will produce black discoloration at the core and insipid flavour. Avoid applications of dung-water, but rather have recourse to some concentrated manure. Maintain a steady bottom-heat of 85° to 90°; for fruiters the heat should not decline below the former, neither should it exceed the latter figure mentioned.

**Early Starters.**—Queens which have been at rest for some time must be kept quiet during the present month; a warmth of 55° will be quite high enough for these at night, and bottom-heat 70° to 75° will be ample. Afford sufficient water, to prevent the tissue of the plants from shrinking; but, as a rule, little or no water at the root will be necessary during the present month. Admit a little fresh air daily when the thermometer exceeds 60°, but avoid cold draughts. Where the bottom-heat for early starters is dependent on leaves alone it should now be seen to, choosing Spanish Chestnut, Beech, and Oak leaves for the purpose of refreshing the heat, and let the new material be trodden as firmly as possible to prevent rapid fermentation.

**Successions.**—These should now be at rest; let the bottom-heat be as near 70° as possible, and the atmospheric temperature 55° to 60°, according to the weather. Take advantage of all favourable opportunities of admitting air at the top of the structures, but the ventilators should be closed by 2 p.m.

**Suckers.**—When their pots are filled with roots they require careful management during the next few months; water the plants whenever they are getting dry, especially where the pots are plunged in a bed made over hot-water pipes: 70° to 75° will be a safe root temperature for these. In houses with good clear glass, where the plants are in close proximity to it, and where it is found necessary to push forward any of the suckers which were shifted into a size larger pots a little hastening of growth may be done; but where the houses are heavy and glazed with old-fashioned small panes, and the plants far from the glass, this must not be attempted.

**Strawberries.**—Give every attention with water, the pots being now crammed with roots, and when these are allowed to get dry no after-management will make good the injury done to the plants. Keep the pots free from weeds, and see that the roots are not making their way into the material on which they are standing. I have placed my Strawberries on trellises this season, and they have well repaid the labour. *W. M. Baillie, Luton Hoe.*

## THE KITCHEN GARDEN.

**PEAS.**—The warmest and most sheltered position available should be devoted to this sowing, and the soil should have a liberal quantity of manure dug in before sowing the seed. In this district November 13 is quite early enough for putting the seed in the ground. Six feet apart is about the right distance at which to have the rows. After filling in with the soil, I place good sifted coal ashes over the rows at once, to the depth of 1 inch, and about 9 inches in width; this prevents to a certain extent the frost from penetrating the ground, and it seems to hasten the germination of the seed. It may be remarked that it is important that the seed for this sowing should be new and good. The varieties found very suitable are Laxton's Earliest of All, Veitch's Extra Early, Chelsea Gem (dwarf), and Standard. The three first come into use very nearly at the same time, whilst Standard is a good hardy Marrowfat Pea, which is fit for use very soon after the others, and it is a capital cropper.

Some Broad Beans may also be sown in a similar position and manner. Johnson's Wonderful is a good hardy variety.

**Seakale and Rhubarb.**—If these be forced in the open, the roots should now be got in readiness for forcing by clearing off the decayed leaves and placing a small heap of coal-ashes over the crowns to prevent slugs attacking them. The forcing pots should then be put on, and a stake about 4 feet in length should be placed against each root, and all can then be covered over with fresh leaf s, but care should be taken not to get too much heat by making the heap too large in the first instance, as fresh fallen leaves—and especially Walnut and other soft sappy leaves—heat more violently than would be the case in the winter time. Good Seakale and Rhubarb may be had in this way at Christmas if well attended to; but where a Mushroom-house or warm shed is at hand the forcing is easier done. The temperature there may range day and night at from 55° to 60°, a moist atmosphere and the complete exclusion of light being the other essentials. I have seen this operation accomplished very successfully in the brick pit usually found at the back of Cucumber-houses the light being shut out. *W. H. Divers, Ketton Hall, Stamford.*

**NOTICE to SUBSCRIBERS and OTHERS.**  
Post-office Orders and Postal Orders should be made payable at the Post Office, No. 42, DRURY LANE.

**GARDENERS' CHRONICLE OFFICE TELEGRAMS.**  
NOTICE to Correspondents, Advertisers, Subscribers and others. The Registered Address for Foreign and Inland Telegrams is "GARDCHRON, LONDON."

Now ready, in cloth, 11s. 6d.

## APPOINTMENTS FOR THE ENSUING WEEK.

### MEETING.

SATURDAY, Nov. 10—Royal Botanic Society: General Meeting.

### SHOWS.

MONDAY, Nov. 5—Surrey (two days).  
TUESDAY, Nov. 6—Kingston (two days).  
WEDNESDAY, Nov. 7—National Chrysanthemum (two days).  
THURSDAY, Nov. 8—Teddington (two days).  
FRIDAY, Nov. 9—Crystal Palace (two days).  
Leicester and Midland (two days).  
Hitchin.

### SALES.

MONDAY, Nov. 5—Dutch Bulbs, at Stevens' Rooms.  
Dutch Bulbs, at Protheroe & Morris' Rooms.  
Dutch Bulbs, and Plants, at Small's Rooms.  
Nursery Stock, at the Goldsmith's Park Nursery, Gosport, Hants., Sussex, by Protheroe & Morris (two days).  
Nursery Stock, from Sample, at Protheroe & Morris' Rooms.  
TUESDAY, Nov. 6—Roses, Greenhouse Plants, Fruit Trees, Bulbs, &c., at the City Auction Rooms, by Protheroe & Morris.  
Nursery Stock, at the Hale Farm Nurseries, Tottenham, by Protheroe & Morris.  
Dutch Bulbs, at Stevens' Rooms.  
Lilium auratum, Azaleas, Camellias, Greenhouse Plants, English-grown Lilies, &c., at Protheroe & Morris' Rooms.  
WEDNESDAY, Nov. 7—Plants and Dutch Bulbs, at Small's Rooms.  
Dutch Bulbs, and 5000 Lilium auratum from Japan, at Stevens' Rooms.  
Dutch Bulbs, at Protheroe & Morris' Rooms.  
THURSDAY, Nov. 8—Nursery Stock at Woollett's Nurseries, Catterham, by Protheroe & Morris.  
Plants and Dutch Bulbs, at Small's Rooms.  
SATURDAY, Nov. 10—Dutch Bulbs, at Stevens' Rooms.

Land ahead. THE passing, with ultimate unanimity, of two important resolutions respecting the future of the Royal Horticultural Society, at the last of the interesting and practical meetings held in association with the Chiswick Apple and Pear Conference, lead to the conviction that the proper position of the Society in the world of horticulture is at length being realised, and that a course is being indicated which may ultimately lead to excellent results. The Royal Horticultural Society has done much good work in its time, but it is doubtful whether in any one single effort it has ever accomplished so much that is eminently practical as were the recent exhibition and Conference. Here we saw a wonderful display of Apples and Pears brought together from nearly all parts of the kingdom, without hope of any reward, and at considerable cost and trouble to the growers. Still further, we saw Conferences attended, day after day, by a large number of interested persons; we heard papers full of matter of practical value, contributed also by gentlemen from various localities; and discussions of an enlivening nature

kept up throughout the three meetings, and all for love of the old Society, and for that horticulture which it is its duty to represent and to lead. With such a remarkable tribute thus paid to the Society how very important it is that recommendations to the Council, as embodied in the resolutions passed so heartily at the recent conference, should have the fullest and kindest consideration.

The promoters of these resolutions are persons who, not only in connection with the recent Conference, but in other directions, in times past, have done much to promote the welfare of the Royal Horticultural Society, and when suggestions of the nature embodied in these resolutions emanate from them it is obvious that not only do the few speak for themselves, but they speak practically for the body of horticulturists at large. Whether the Council of the Society feel much sympathy or not with the spirit of Mr. SHIRLEY HIBBERN's proposal it would be very unwise to ignore it altogether, or to treat it as outside their powers. The selection of a body of some ten or twelve persons, including members of the Council and of the respective committees, or even of persons outside of these bodies, would be peculiarly fitted to render help to commercial horticulture in the directions named, would show that the Council has no disposition to stand in the way of the wishes of the Fellows and horticulturists generally, in respect of a matter which might prove to be ultimately of the highest importance. It is true the reference contained in Mr. HIBBERN's resolution covers wide ground, and, if carried out according to the strict terms of the resolution, would entail expense beyond what the Society can bear, even if the charter bogey do not prohibit it, which is doubtful! But the Council in appointing the proposed committee, may, while giving a wide interpretation to the resolution, and accepting its spirit, rather than its letter, define what should be the nature of its duties, and thus clear up what, so far, is somewhat indistinct. The particular reference made in Mr. TALLERMAN's addendum to the resolution is very clear and decisive. It is only needed to make other references as clear, and the work of the committee may be productive of much good. The proposal is important, because it assumes that the Royal Horticultural Society has duties to horticulture economical as well as technical, and the more fully these duties are carried out the more popular must the Society become as a truly national horticultural organisation.

The resolution proposed at the instigation of Mr. MALCOLM DUNN, acting on behalf not only of the provincial but also of metropolitan horticulturists, possesses, perhaps, the greatest weight, because it bears so conclusively on the technical work of the Society. Mr. DUNN, in company with many others from far and near, gathered together at Chiswick for the discharge of good work, and for taking part in the recent Conferences, and found that, although the old and world-famed gardens have been largely shorn of much of their ancient area and beauty, yet that they still remain the home of practical horticulture, and really have no equal in the entire kingdom. They see with so much that is of present value, and so much which, if fostered, might soon develop into great prospective importance, also considerable dilapidation, and poverty allied almost to starvation. What wonder, then, if anxiety for the future of Chiswick should give rise to a determination to force the needs and necessities of the case upon the attention of the Council, and invite from that body speedy amelioration. Chiswick has had an illustrious past, but with our now

marvellously developed horticultural knowledge and practice that past ought to be utterly eclipsed by its much more practical as well as brilliant future. It is very hard to learn of colleges of horticulture being established elsewhere, when we have at Chiswick the elements which no other place can furnish so well. What if the old gardens were, under the auspices of the Royal Horticultural Society, converted into at once an experimental garden allied to a horticultural school? How proud would gardeners of all sections be to find that something was at last being accomplished in the direction of training our rising youth to become worthy gardeners of the future. Chiswick needs paint and putty, it needs the labour of the carpenter and the bricklayer, and, not least, more labour in the cultivation of its soil and the utilisation of its houses to the highest of purposes; but, beyond that, it needs actual countenance and encouragement by the presence of the ruling body, and by frequent gatherings there of all who have the interests of horticulture at heart. What a fine situation does it present as a school of horticulture, because so near to all our great teaching institutions. It is almost next door to Kew, the noblest botanical gardens in the world; it is not far from South Kensington, and its schools of art and museums; it is near to the metropolis, with the thousand and one advantages thus offered to students to acquire knowledge in geology, chemistry, botany, or other allied sciences. That may seem to be a large conception to emanate from Mr. DUNN's resolution, but it is, all the same, the ideal which we have for years past, in season and out of season, advocated. We wish to see the gardens devoted to the encouragement and teaching of horticulture of the highest and yet most practical order, overlooking nothing, but promoting everything that is relevant to it. Commercial horticulture in all its varied phases is an important element in gardening now—that in our proposed school of horticulture must be well thought also. Wide as may be the conception, yet all is possible if the Royal Horticultural Society will wisely direct, and the gardeners of the kingdom will both encourage and support it.

**THE GARDENERS' ORPHAN FUND.**—A meeting of the committee took place at the "Caledonian" Hotel, Adelphi, W.C., on the 26th ult., Mr. GEORGE DEAL Presiding, the members being present in good numbers. The minutes of the last meeting having been read, the Hon. Secretary, Mr. A. F. BARROW, announced that the sum of £303 19s. 8d. stood to the credit of the fund at their bankers. Subscriptions and donations were announced to the amount of £38 19s. 8d., including £7 12s. from Mr. WILLIAM WILDSMITH, of Heckfield Gardens, as small sums received from visitors to the gardens; £10 as the balance remaining from an entertainment given at the Vestry Hall by the young men of the Chiswick Gardens in aid of the Fund; and £11 8s. 8d. received from local secretaries. Mr. R. DEAN handed in the sum of £1 0s. 6d. from a collecting-box at the annual exhibition of the Oxford Carnation and Picotee Union at Oxford on August 7 last. Mr. O. THOMAS, of Chatsworth Gardens, wrote to the effect that he, in conjunction with the gardeners of the locality, were arranging a musical entertainment at Chesterfield on November 14, and inviting the attendance of a representative of the committee. The Chairman was requested to represent the body if he could conveniently do so. The Hon. Secretary reported that 3000 copies of the annual report and list of subscribers printed for circulation were nearly paid for by the advertisements which appear in the report. Mr. W. BISHOP, The Grove, Teddington, was appointed a local secretary for that district. A report prepared by the Chairman and Hon. Secretary in reference to the guardians

appointed for the children in receipt of the benefits of the Fund was laid on the table, from which it appeared that a relation had been appointed in every case, and in nearly every instance the mother of the child; also that the arrangements for placing a child upon the Fund in accordance with the terms of the gift of Mr. N. SHAWWOOD had been completed. The amount of money paid as the first quarterly allowance to the eleven children now upon the Fund was £35 15s. Various accounts were ordered to be paid, and the proceedings closed with a vote of thanks to the Chairman.

**HORTICULTURAL CLUB.**—The following circular has been issued:—"The Club has now been in existence for twelve years, and has played no unimportant part in keeping alive the interests of horticulture, both by gathering together in social intercourse those who are interested in the pursuit, and also by the dissemination of knowledge by the papers which have been read at the meetings, and afterwards in the gardening papers. The committee have recently come to arrangements with the Hotel Windsor Company, Victoria Street, Westminster, and the Club has entered upon the occupancy of its new quarters there. The situation is central, close to the offices of the Royal Horticultural Society, and within three minutes' walk of the St. James' Park Station of the District Railway. The hotel is well known as one of the best in London, has excellent smoking and billiard rooms, swimming bath, &c., and special arrangements have been made with the proprietors for the accommodation of members at a reduced rate. The committee think, therefore, that a better support ought to be given to the Club, and would urge upon its members the necessity of enlisting new candidates for membership. Enquiries should be addressed to the Secretary as above."

**BOISSIER'S "FLORA ORIENTALIS."**—M. BUSER has published a supplementary volume containing a sympathetic biographical notice of the ardent and acute botanist, to whom we are indebted for this standard work. Various additions are inserted, together with an enumeration of collectors' numbers, which will be very serviceable to botanists and herbarium-keepers. A portrait of BOISSIER, views of his herbarium, now belonging to the town of Geneva, and a map, are comprised in the volume.

**NATIONAL CHRYSANTHEMUM SOCIETY.**—A largely attended meeting of the committee took place at Anderson's Hotel, Fleet Street, E.C., on the 29th ult. Mr. E. SANDERSON, the President, in the chair. The Eastbourne Chrysanthemum Society was admitted into affiliation, and eight new members were elected, bringing the total up to 581. The Hon. Secretary reported in reference to the provincial show at Sheffield on November 16 that everything promised very favourably, and that great interest was being shown in the exhibition throughout the town. Also that the authorities of the Royal Aquarium had given permission for the British Fruit Growers' Association to hold a meeting at St. Stephen's Hall on Thursday, November 8, and that this meeting would not interfere with their own exhibition. It was resolved that Sir GUYER HUNTER, M.P., one of the Fellows of the Society, be requested to open the exhibition at the Royal Aquarium next week, and he has since signified his willingness to do so. The Hon. Secretary also reported that 100 copies of the new edition of the Society's Catalogue had been sold, and that he had received an application for two dozen copies from Mr. E. H. LIBURY, of the *American Garden*, New York, and that the sum of £52 10s. had been paid for medals supplied to affiliated societies. It being deemed advisable, in the interests of the Society, that a Foreign Corresponding Secretary should be appointed to deal with a large amount of foreign correspondence, Mr. C. HARMAN PAYNE was appointed to that office. As it is more than probable that a number of novelties in vegetables will be submitted for certificates at the autumn show, it was resolved that the granting of certificates should be

left in the hands of the vegetable judges. It was resolved that several Gold Medals of the Society should be ordered, the cost of each not to exceed 5 guineas. The annual dinner of the Society was fixed for Thursday, December 13, at Anderson's Hotel, Fleet Street, E.C., the arrangements being left in the hands of the Hon. Secretary. A vote of thanks to the Chairman brought the proceedings to a close.

**TROPICAL FRUITS.**—The Division of Pomology of the United States Department of Agriculture has published a report of the tropical and semi-tropical fruits grown in the Southern States. The report has been prepared by Mr. H. S. VAN DEMAN, chief of the Pomological Department. The several fruits are enumerated, and details given as to their culture, and the insects and diseases to which they are subjected.

**STOCK-TAKING: SEPTEMBER.**—Appended are some excerpts from the "Trade Returns" for the month of September. To save space many items are simply noted in the general summary, the figures being sufficiently expressive and suggestive. We have no idea that the interdependence will ever be reduced—rather that it will be extended, and for the benefit of the nation. But we have also an idea that we can help ourselves much more than we do now, and that much of the educated labour now so generously supplied to our friends and relatives abroad could be much more profitably utilised at home. The following table is extracted from the summary of the imports from foreign countries and British possessions for the month of September last compared with the corresponding period in 1887, showing the increase (+) and decrease (—) as the case may be in the different sections:—

	1887.	1888.	Difference.
	£.	£.	£.
II.—(A.) Articles of food and drink—duty free ... ..	9,108,126	9,803,163	+695,037
(B.)—do., dutiable ... ..	2,552,319	2,363,452	—188,867
VI.—Raw materials for textile manufactures (including Flax, Hemp, and jute) ... ..	3,151,004	2,800,026	—351,038
VIII.—Raw materials for sundry industries and manufactures (including wood and timber, hewn, sawn, split, dressed; vegetable materials, for paper-making, &c.) ... ..	3,636,179	3,777,477	+140,998
IX.—Miscellaneous articles (including Clover, grass, Flax, Rape, Linseed ... ..	860,813	1,068,614	+207,801
Total value ... ..	27,191,594	28,414,372	+1,222,778

We have space for only a few items, as follows:—

	1887.	1888.	Difference
§ II. Fruit:—			
Apples, raw ... .. bush.	166,107	419,336	+253,229
Unenumerated, raw ... ..	481,208	821,978	+340,770
Onions ... ..	487,018	281,451	—105,567
Potatoes ... .. cwt.	61,508	43,119	—21,389
Vegetables, raw, unenumerated ... .. Value	£39,612	£43,143	+£3,501

It might not be found difficult to give the items in the case of fruits and vegetables "unenumerated."

**DOMINION OF CANADA.**—A new edition of the official *Handbook of Canada* has just been published with the approval of the Secretary of State for the Colonies and the Canadian Government, and can be obtained, without charge, on application to the office of the High Commission, at 9, Victoria Chambers, S.W. The handbook contains the latest statistical data respecting the financial position of the country, its trade and commerce, and other matters of interest to the general reader; while the demand for labour, the openings offered by the

different provinces in connection with settlement, and the investment of capital, are also fully dealt with.

**THE NEW VEGETABLE.**—It appears, from the letter of a correspondent, that the *Stachys tuberosa*, to which we alluded last week, will not succeed in all soils. We narrated our experience on clay. On sand our correspondent tells us that he has not succeeded in obtaining a tuber bigger than a horse-bean, while the plant itself does not grow more than 6 inches in height. This is very different experience from ours, and points to the necessity for a deep, rich, moist soil as the most suitable. Perhaps in the poor sand it may be induced to flower and have its name registered like a good citizen.

**"REICHENBACHIA."**—The following plants are figured in the last number:—

*Zygopetalum Wendlandi*, t. 53.—A native of Costa Rica, with flowers 4 inches across with greenish-white sepals and petals, and a broad labellum always recurved at the tip. It is adorned with a large blotch of violet-purple and heavy pencillings of dark plum. The temperature under which it should be grown ranges from 60° to 70° Fahr. The plants should be placed in a moist and shady position, and must never be allowed to become dry.

*Cypripedium selligerum majus*, t. 54.—A cross between *C. barbatum* and *C. philippinense*, Rehb. f. it requires to be shaded from direct sunlight, but delights in a hot moist atmosphere. The flowers have long renate petals, whitish at the base with the green veins and some dark blotches, and light mauve-purple on the anterior blade. The sepals are white with reddish-violet veins. The lip is brownish.

*Angraecum articulatum*, t. 55.—A rare species, from Madagascar, with graceful pendulous racemes of white flowers with long, thread-like spurs. It should be grown in a basket, and hung close under the roof, in a light position, in an East Indian house, where the temperature in summer would range between 70° and 80°. It likes plenty of water in summer, but care must be taken not to overwater in autumn and winter.

*Lelia anceps Sanderiana*, t. 56.—A lovely variety, very closely allied to the exquisite *L. anceps* Dawsoni, but differing from it in its less rhomboid petals. It begins to flower in December, remaining until February.

**"THE BRITISH MOSS FLORA."**—The eleventh part of this work, which reflects so much credit on Dr. BRATTHWAITE, has just been issued. It is the commencement of a second volume, and begins with an account of the Grimmiads, marked by all the conscientious care and skill which has been so characteristic throughout.

**"KÖHLER'S MEDIZINAL PFLANZEN."**—The coloured figures of this publication are so excellent and so cheap that we call attention to them, as others besides pharmacists cultivate these plants. EUGEN KÖHLER, of Gera, is the publisher of the book, which may be had in parts from WILLIAMS & NORRAT.

**GARDENING AND PHILANTHROPY.**—If any one would witness an illustration of this in combination he can do so by visiting one of Dr. BARNARD'S institutions known as the Girl's Village Home, at Barking Side. Here about 9 acres of ground, formerly fields studded with trees, have been converted into a model village, upon which have been erected forty-nine cottages, formed each of two in the usual semi-detached style, but united together for domestic purposes. In these cottages, each of which stands within its own grounds, there are located 800 girls—a portion of the waifs and strays of the London streets, gathered here to be clothed, fed, educated, and prepared to fight the battle of life. There are forty-nine commodious cottages. From twenty-five to thirty children are located in each cottage, under the care of a mother—generally some lady who devotes herself to the work; and it is said by those who are in the habit of visiting the village that the most cordial sympathy exists between the mother and her temporary family. The

cottages form two rectangles, and within the lines there is an expanse of some 7—8 acres facing a village green and garden. The garden is not enclosed in any way, but is free for the children to play in, and one of Dr. BARNARD's leading ideas is that the children should freely mingle and play in the homely fashion they would do on a village green. Round the circumference of the green and garden run broad gravelled roads of great width, well constructed, with similar roads joining them in cross lines; and there are thousands of yards of walks laid with Kentish rag and tar paving, and these walks wind about in various directions, but in all cases avoiding the old timber trees, which have been as fully preserved as possible. Each cottage has its garden, and it is intended that the children shall cultivate these; and it is proposed to institute a series of competitions, to incite the children to cultivate their gardens to the utmost. The entire reconstruction and laying out of the grounds was entrusted to Mr. WILLIAM HOLMES, of the Frampton Park Nurseries, Ilackney, who is just bringing the work to a close. The design is a fine one, and includes a large extent of grass plat, with belts of shrubbery, large circular beds of Rhododendrons. The rockwork surrounding the large basin it is contemplated to plant with aquatics, and there are two Rose temples; whilst here and there, at prominent points, scroll flower-beds have been laid down. As much of the planting was done in late spring, the wet summer has proved very helpful, and but few failures have resulted. The cottage paths are "granolithic"; they are carried all round by the back offices. The drainage of each cottage, and indeed of the whole village, appear to be carried out in the most complete manner. At one point—that opposite the residence of the superintendent—a glimpse of the whole extent of the grounds can be obtained; the design in laying out being so arranged. One large cottage, raised to the memory of the late Earl Cairns, serves the purpose of a board-room, &c. All the dwellings are planted with creepers of various kinds, and they are fast covering the walls.

**CHISWICK GARDENERS' MUTUAL IMPROVEMENT ASSOCIATION.**—At the annual general meeting of the members of this Institution, held on Friday evening last, October 26, Mr. George Gordon was unanimously elected Chairman of the meetings during the ensuing session. The following papers were promised to be read on the undermentioned dates:—November 2, Opening Address, by the Chairman, Mr. George Gordon; November 9, "What constitutes a Gardener," Mr. John Fraser; November 23, "Roses and their Cultivation," Mr. T. Bones; November 30, "Economic Plants of the Order Labiata," Mr. A. Parsons; December 7, "An Over-supply of Gardeners—a Remedy," Mr. J. Barry.

**HIGH-PRICED CYPRIPEDIUMS.**—Messrs. PROTHEROE & MORRIS, of Cheapside, have sold for 150 guineas a small plant, with three leaves, of a hybrid Cypripedium, known as Cypripedium Marshallianum, to a gentleman resident in America. The plant was a cross between *C. venustum* and *C. concolor*. A small plant of *C. leucorrhodum* was sold at the same time for 40 guineas.

**FILMY FERNS AT KEW.**—Readers interested in filmy Ferns will be pleased to learn that the magnificent collection presented to Kew by Mrs. COOPER FOSTER, in April of this year, is now safely established in its new home, and that almost every one of the plants has made considerable growth this summer.

**CHRYSANTHEMUM SHOWS.**—The following list of shows for November, includes all of which notice has been received by us. The opening only is given in the case of two-day shows, &c.:—November 5th, Surrey; 6th, Kingston; 7th, National, at Westminster, Bath, and Portsmouth; 8th, Teddington; 9th, Crystal Palace, Leicester, and Hitchin; 13th, Brighton, Winchester, Devizes, Cardiff, Watford,

Hammersmith, Twickenham, and West Kent (Bexley Heath); 14th, Market Harborough, Bradford, Bromley, Cornwall Polytechnic (at Falmouth), and Ancient Society of York Florists; 15th, Pembroke, Wiltshire, Aylesbury, Reading, Taunton, Wimbledon, and Royal Horticultural of Ireland; 16th, Devon and Exeter, Sheffield, (and National Provincial), Huddersfield, and Chiswick; 17th, Ramsbottom, and Derby; 20th, Edinburgh, Oxford, Liverpool, and Hanley; 21st, Birmingham, and Midland Counties, Rugby, National (Committee), Croydon, Bristol, and Banbury; 22nd, Hull; 23rd, Pontefract, Bolton, and Stockport; 28th, The Hartlepoons.

**PUBLICATIONS RECEIVED.**—*Michigan Agricultural College Annual Catalogue*.—Lace and Lace. (M. JESARUM & Co., Venice).—*Souvenir d'une Excursion à Cintra*. By G. D. SAINT VICTOR.—*North of Scotland Horticultural Association Seventh Annual Report* (Aberdeen).—*Mushroom Culture Simplified* (London: HURST & SON, 152, Houndsditch).

## THE FLOWER GARDEN.

**HERBACEOUS BORDER.**—The usual clearing-up may now be done; and this will be all the attention that it will require for the remainder of the present year. Cut off old flower-stems to within about 2 inches of the crowns; afterwards hand-weed and rake over the surface, and, if the soil in the borders is not rich, a top dressing of well-rotted manure may be laid on about 2 inches thick. Avoid pointing over the surface with a fork or spade, for the roots of the plants are so near to it that only injury will result thereby. The present is the best time of the year for making new, and replanting old, borders, owing to the fact that more species of plants may be lifted and divided than at any other period. For the benefit of those who are taking-up the cultivation of these plants for the first time, and who contemplate making new borders this autumn, a few details may be of some assistance. First then, as to site, I would say that in all cases where the matter is one of choice, preference should be given for an open situation and well-drained soil; this, however, is not an absolute necessity, as many perennial plants will grow fairly well almost anywhere; still it is as well to bear in mind that there are places which may be described as bad, the worst possible being in the immediate vicinity of large trees, whose roots impoverish the soil, and the branches in the summer months shade the plants growing near. There is nothing objectionable in having a border in front of dwarf-growing shrubs, with trees in the background,—indeed, this is where we most frequently find them in private gardens, neither is there anything to be said against their being in close proximity to a fence or a wall with an east, west, or south aspect. Having selected the site and marked out the extent of the border, the ground should be trenched over, and if out of condition a dressing of decayed manure should be worked into the soil as the digging proceeds; the character of the soil in each case must determine the matter of bringing the bottom spit to the top; in many instances it is not advisable to do so. If the soil be of a stiff, retentive nature, and liable to bake on the surface in hot weather, nothing is better than mixing a liberal quantity of burnt clay, wood-ashes, leaf-mould, or finely sifted coal-ashes along with the staple on the surface.

In planting an open border—that is, one not near a wall or shrubbery—of, say, 12 feet wide, the arrangement of the plants ought to be of such a character that the border will present a double face, so to speak, the tallest growing species being in the centre, and gradually reducing the height down to the outside. On a border of this width seven rows of plants will be sufficient, and they may be arranged as follows:—Central row: Delphiniums of sorts, Pyrethrum uliginosum, Helianthus rigidus; these to be planted at a distance of 6 feet apart; the majority of these will grow from 4½ to 6 feet high. The second row may be at a distance of 3 feet from the preceding, and may contain Michaelmas Daisies in variety, Spiræa aruncus, Verbascum nigrum, V.

blattarioides, V. nigrum, Boconia japonica, Gnothera grandiflora, Papaver bracteatum, Solidago canadense, and Lilium candidum. These will average from 3 to 4 feet. The third row from the centre should be at a distance of 18 inches from the second, and may be planted thus:—Anemone japonica, Aquilegia corulea, A. chrysantha, Asphodelus luteus, Dictamnus fraxinella, Achillea ptarmica fl.-plena, Aster dumosus, A. grandiflorus, A. amellus, A. a. bessrabicus, Astrantia major, Chrysanthemum arcticum, Dielytra spectabilis, Doronicum caucasicum, Geum coccineum, Hemerocallis flava, Iris amona, I. Kämpferi and its varieties, Lobelia fulgens, L. syphilatica, Lychnis chalcedonica, Gnothera Youngi, Phlox, florists' varieties; Rudbeckia Newmanni, and Stenactis speciosus. The next row should be 8 inches from the edge of the border, and may be planted with such species as Campanula collina, C. carpatica, Draccephalum austriacum, Gentiana verna, Hepatica trilobis and varieties, Iberis gibraltarica, Tussilago farfara variegata, P. fragrans, Veronica candida, V. reptans, Helleborus niger and its varieties. The above will form a fairly good and interesting collection, and will afford a long succession of flowers. Before planting tread the surface down moderately firm, and as the planting proceeds press down each plant also, and finish off with a top-dressing of half-decayed manure. Young plants raised from seed the current year may also be planted out now, not forgetting to disentangle the roots of such as are pot-bound.

**Bulbs.**—The majority of Dutch bulbs for flowering in beds outside ought to be planted now, including Hyacinths, Tulips, Narcissus, &c. Plant also a few Anemones and Ranunculuses for early flowering. It will be advantageous to cover all these subjects with about 2 inches of cocoa-fibre refuse, *S. Horsfield*, *Heytesbury*.

## FORESTRY.

**TIMBER SELECTION AND MARKING.**—As the month of November opens, this is by far the most important work of the forester. So important is it indeed, that many owners prefer to keep a general oversight of the operation themselves. Where the timber is of an ornamental character this is no doubt desirable; but under other conditions it is well that the forester be allowed as free a hand as possible, for being more constantly in the woodlands, his acquaintance with the wood under his charge is naturally closer. This, however, is of course quite a matter between employer and employee, and is only remarked upon in passing. To treat the subject in order, the first consideration will be

**Marking Instruments.**—These are not so unimportant as may at first appear, and will consist of either knife (scribe), hammer and axe combined; and of paint brushes. I have seen standing timber marked with pencil, in one case especially on an estate belonging to the Ecclesiastical Commissioners, and the figures remained visible for several years, as the timber was not felled as intended; but this is not to be recommended. For timber-marking generally there is probably no instrument so much used as the knife or scribe. This in one form or another is familiar enough to most who are used to woodland work, but there is probably not one instrument in ten which is thoroughly effective. The most common pattern is that which closes like an ordinary pocket or pruning knife, and not unfrequently is set in the handle by the side of the blade. Such an instrument as this may do duty once, but is totally unsuitable for any amount of work. A great essential in a good timber scribe is thorough rigidity, and this the ordinary hinged instrument lacks to a very great extent. Another drawback is the shortness of the "bill" or cutting portion, and it is also very often badly formed. The instrument I use, and which I have given a good deal of wear in an extensive practice, I obtained from a firm in Hereford, and is by far the best thing which has come under my notice. It is used by most of the railway companies' inspectors, and consists of an octagonal Walnut handle, about 5 inches long, somewhat Pear-shaped. Into this the blade, about 3½ inches long, screws very firmly, and the whole instrument is as rigid as though made in one piece. The "bill," or cutting portion, was originally about 1½ inch long, and carefully turned, so that the curved edge which makes the incision works quite smoothly. When not in use the blade goes readily into the vest pocket, and the handle into the coat. The cost of this instru-

ment is Gs, and new blades can be obtained separately when necessary. The next most essential instrument is the marking hammer and axe combined. I know of no firm which makes this a specialty, so its manufacture has generally to be intrusted to local people who imperfectly understand what is necessary. This hammer may be in various forms, the chief points to consider being a clear and well cut letter or letters on the face and an axe at the tail, large and keen enough to remove Ivy, the rough bark, &c., from the stems of the trees, and leave a surface sufficiently smooth to obtain an effective impression from the opposite end of the hammer. The blade of the axe may either be hollow or solid. In the former case the cutting edge will be merely a curved band of steel, welded at the extremities to two arms springing from the centre of the hammer. When made in this way there is a considerable gain as regards lightness, and the whole thing looks more symmetrical, without any great sacrifice of strength. The brush will not need much comment, as almost any ordinary paint, or small white-wash brush will do for the purpose. As the usage, however, on the bark, mosses, Ivies, &c., is rather rough, one which has been partially worn will answer, especially where dashes of colour and not letters or figures are required.

**Methods of Marking.**—The points to be borne in mind in carrying out this work are intelligibility, and giving a character to the marks which cannot easily be imitated or tampered with. What I mean by intelligibility is that it is necessary to consider that the bulk of the people who have subsequently to view, fell, and cart away the trees will not be so well acquainted with names of fields, plantations, hedgerows, and the like, as those to whom the marking is entrusted. Auctioneers are apt to cause a good deal of confusion in this way. I have not unfrequently seen in a catalogue of a single sale the numbering commence with one in half-a-dozen places. This is most perplexing to strangers, as they cannot be expected to know the situation from any description appended. It is a thing which often leads to trouble and confusion, and is a caution as necessary in private sales or sales by tender as in auctions. Circumstances must of course suggest the actual way; but, speaking generally, a combination of figures and letters in white paint, will be found the most simple and correct, as, if carefully managed, any repetition can be avoided. In the prevention of tampering with, or the imitation of marks, the hammer is most useful. In using the scriber or paint-brush, it is obvious that no great skill would be necessary to multiply the marks indefinitely, and cause loss or error. If, however, a hammer with a distinctive letter is used on each bole, either with or without the paint mark, and proper care be taken of it when not in use, the chance of felling the wrong timber will be reduced to a minimum.

**Selection.**—Though coming first in order I have purposely left this until last, so as to touch upon the tools and methods of marking. It is, however, out of all proportion, the most important part of the subject, and a thing requiring more judgment in park lands, fields, and the like, than in plantations. In thinning or felling plantations, when the order of work has once been laid out, it can be gone on with methodically, and does not entail the critical examination of every individual tree or pole, as must be done when timber is in any degree isolated. In mixed woodlands, too, where the trees are often of varying ages, greater care is necessary. Where it is proposed to select a series of trees to be made before the final decision is come to. When this plan is followed, marking the trees in the first instance with a dash of whitewash greatly aids the operation, as it is at once seen, and when any alteration is made in the second survey, is as easily removed. The actual trees selected will naturally depend upon the object for which the felling is contemplated. If merely to clear the defective, ill-formed, and too crowded wood the business will be greatly simplified, and the chief care needed will be, that in removing a defective tree it does not spoil the appearance of its neighbour or of a group. I know a place well which a few years ago was one of the best timbered estates in the district. It is true that many of the trees had passed their prime, and the clearance of a considerable number of them was a necessity. In doing this, however, it does not appear that the slightest judgment was used, with the result that what would previously have made, for its size, as beautiful a park as any in England—as the site is of a delightfully undulating nature—has been reduced to a mere wilderness, and looks as though a tornado had swept through it. This is the more to be regretted,

as there is still timber enough to make a fairly wooded demesne, if only a little intelligence had been used in felling. It is, however, only fair to say that this is not the work of any one professing any knowledge of the subject, but I believe is the joint effort of the estate carpenter and the merchant. I speak of this incident at some length, as when on occasion I have had to say some rather strong things upon the way in which such important matters are allowed to drift, some writers have doubted whether they were really so bad.

One mistake amongst inexperienced men—and one which often leads to the disfigurement of places—is the fear of cutting down a small or young tree. None will dispute that it is most important to preserve every young tree possible, when it is in the right position, yet there are many cases where I would not for a moment hesitate to sacrifice a young tree and preserve an old one. This is especially so with groups which are often composed of trees of all ages, but which, nevertheless, so entirely depend upon each other that the larger ones cannot be removed without entirely destroying the effect of the others, if it does not their existence. Under such conditions I would remove the whole and replant, rather than leave two or three sickly, lanky objects simply because in the matter of years they had not come to maturity. By doing this one would often be able to save an interference with some other group altogether, as the cubic contents of an entire clearance would equal that of a tree here and there from two or three groups, and avoid the destruction of effects which it takes an average lifetime to produce. The same thing is true in a lesser degree of hedgerow trees, but does not apply nearly so much to woods which depend for beauty on their general mass. This selection question is so many-sided that in a paper like this it is only possible to touch upon a few of the commonest mistakes, but there can be no doubt that many of these mistakes could be easily avoided if owners would only recognise that it requires a considerable nicety of judgment in determining what trees to fell, and that the mere ability to handle an axe or a saw is not necessarily a qualification. *D. J. Yeo, Lyncham, Wilts.*

## NURSERY NOTES.

MESSRS. BACKHOUSE & SONS', YORK.

This grand old establishment, with its fine collection of Orchids, its matchless stores of Filmy Ferns, its complete and well-kept collection of alpine and other hardy plants, and its large, select, and well grown stock of most things appertaining to a first-class nursery fully maintains its old reputation, and that is all that need be said on the point, for that that reputation is one of the highest that a nursery establishment need aspire to is well known. It seems a difficult task to undertake an enumeration of even the most prominent of its attractions, but nevertheless a note of a few things taken at a visit on the 25th ult. will be of interest to many.

### THE ORCHIDS.

Among these the York Cattleya-house has always caused a great amount of interest by reason of the excellent quality of the plants and flowers which were formerly grown in the fine, well-ventilated, roomy, span-roofed structure, without the least attempt at shading from the fierce heat of the sun's rays even in the hottest summer. That the plants were fine none could gainsay, although most good Orchid growers condemned the practice of growing them unshaded. Ultimately, Messrs. Backhouse decided to use a thin shading, and all Orchid growers will be interested to know that it has had a beneficial result; less water being required, more root is made, and improvements in all directions have resulted.

The varieties of *C. gigas*, the large leafy masses of which are well-known to visitors, are, if possible, more robust and more floriferous than heretofore; and the *C. Trianae* are equally good, and contain some charming named varieties, among which the following may be named:—*C. T. The Bride*, a lovely white, with pearly tints; *C. T. Enchantress*, a grand light form; *Aurora*, *Eboracensis*, insignis, and the crim-

son-feathered *C. T. Backhousiana*. *Cattleya labiata* *Schroderae*, *Laelia purpurata*, *L. elegans*, and other of the large *Cattleyas* and *Laelias* are also well sheathed for flower in the large *Cattleya*-house; and a good batch of *Odontoglossum citrosimum* enjoys the well-lighted situation in a corner thereof.

The varieties of *Laelia anceps* have many flower-spikes, and form the principal feature in the Mexican-house; in which, too, is a grandly flowered lot of *Odontoglossum grande*, *Laelia albidula*, *L. purpurata*, *L. Gouldiana*, *L. autumnalis*, &c.; and a number of robust plants *Cypripedium Spicerianum* which have been grown in the *Odontoglossum*-house for the past summer, are just expanding their flowers. The plants are immeasurably superior to any that have been kept in heat all the year, and so probably would be more than one-half of the other *Cypripediums*.

The *Odontoglossums* and other cool Orchids are in splendid condition. A sprinkling of good things noted in flower among the plants of *O. crispum* and *O. Harryanum*. The best white *Lycaste Skinneri* alba, some pretty scarlet *Sophrontitis*, *Laelia prestans*, *Odontoglossum Insleyi splendens* (in bud) were remarked in flower or approaching the flowering stage. Among a well grown and varied collection of *Cypripediums* in one of the warm houses many were in flower or in bud; and in another house some plants of an importation of *Cattleya aurea*, which it is expected will yield some of the beautiful *C. Hardyana*, were in bud. One great advantage to buyers of Orchids at the York Nurseries is that the plants are fairly and even hardly grown, so that they travel well and thrive after a journey, which nursed-up plants often succumb to at once, or are invalids for years.

The *Disas* are marvellously well done here, and the greater part of a cold house is devoted to a plantation of them. Here many yards of *D. grandiflora* may be seen of a vigour altogether astonishing to those who have only seen ordinary plants. As may be required the strongest are taken up and potted for sale, and when in bloom the house is a beautiful picture of vivid scarlet flowers. Other distinct and lovely forms of *D. grandiflora*, too, are here, and notably a rich crimson form, and one with vermilion flowers tipped with yellow. Treated also, in a similar manner are lesser quantities of the handsome *D. racemosa*, the rare and lovely large white *D. crassicornis*, and several species of the grassy-leaved section.

**The Filmy Ferns.**—These form a display which, for quantity and variety, is unequalled. The collecting and growing of these lovely plants have cost Messrs. Backhouse many years of labour, but the result attained is such, that a very beautiful array of them has been acquired, whose beauty must be seen before a true idea can be formed of them. In the matter of variety, it should be said that this firm publish a separate catalogue of Filmy Ferns, in which some thirty fine species and varieties of *Hymenophyllum*, and fifty of *Trichomanes*, are enumerated and described. Those seen in the sunk, unheated rockery, falling in graceful masses over the rocks, or nesting in quiet nooks, are very beautiful; nor are the lesser specimens in pots or on Tree Ferns in the houses devoted to the plants for sale scarcely less attractive. In the rockery is an unique mass of a very elegantly cut form of *Trichomanes radicans*, collected many years ago in a stone quarry near Leeds, and perhaps the last recorded in Yorkshire. Very lovely too, were great masses of *Hymenophyllum flexuosum*, *H. pectinatum*, *H. caudiculatum*, *H. crispatum*, *H. cruentum*, *H. dichotomum*, *H. dilatatum*, *H. demissum*; *Trichomanes radicans dissectum*, *T. reniforme*, *T. Luschathianum*, *T. meifolium*; while *Lomariopsis heteromorpha* seems also to revel in the cool cave-like atmosphere.

The general collection of Ferns and the noble rockery with tree and other Ferns, are worthy of the Filmy Ferns. The house of *Gleichenias* contains perfect specimens of all sizes; *Nipholobus lingua corymbifera* is in quantity, so also the rare *Oncophorus*

auratum, and the miniature Tree Fern *Lomaria*, *L. Herminieri*, with its young leaves of a crimson hue. The British and hardy section, too, is well kept up. In the other houses are good collections of stove and greenhouse plants, very well grown, among them being a fine collection of *Nepenthes*, one of the specimens of *N. Mastersiana* and another of *N. Rafflesiana* being about 4 feet across, and grandly pitched; *N. Northiana* and *N. Veitchii* are noble specimens, all the others being good; and one which seemed to be a nearly green form of *N. Rafflesiana*, probably new. Among fine things in quantity was a large stock of white *Lagerflora*, a large batch of *Rogeria gratissima*, interesting *Bertolonias* and other painted-leaved plants, well-grown *Pteroma elegans*, a house of choice *Cliveas*, the neat *Azalea roseiflora*, *balsamiflora* and the large-flowered Indian species in great numbers of well-grown specimens; *Heaths* and *New Holland plants*, &c.

For the extensive outdoor nursery of trees and shrubs, which some will doubtless consider the most important part, at present it must suffice to say that everything is, as usual, good, and kept in perfect order.

## IRELAND.

### BELMONT NURSERY, BELFAST.

This nursery is pleasantly situated in a beautiful semi-rural district about three miles from Belfast. A fine block of some ten or twelve plant-houses confronts the entrance gate, and contains a varied stock of well-grown stove and greenhouse plants, including masses of Ferns for cutting and other purposes, *Palms*, *Cycads*, and *Orchids*. Tuberous *Begonias* here, as everywhere at the present time, have taken a hold as a horticultural fancy, and a varied and fine collection is grown. Celebrated as the name of Dickson is in connection with Rose-raising and growing, it would have been surprising not to have found some portion of the glass devoted to the Rose in the establishment of Mr. Hugh of that name, and the visitor is not disappointed. A large stock of *Teas* is grown expressly to meet the demand for plants for early forcing. The plants were already (beginning of September) fully matured, and were turned out-of-doors to rest; fine sturdy bushy plants they were, with short-jointed solid growth, giving great promise of bloom. A fine batch of *Maréchal Niel*, and *Gloire de Dijon* occupied the roof of another house, and the vigour they exhibited in their stout long shoots was exceptional.

In the neighbourhood of the houses, borders and quarters were planted with *Gladioli*, *Dahlias*, *Carnations*, *Picotees*, &c., all of which are specialties of Mr. H. Dickson. The two first-named, and particularly the second, were considered backward, and inferior to their usual form, owing to the ungenial weather that had been experienced, yet they were quite up to the average in growth and flowering, though the blooms were smaller than in ordinary seasons.

Large numbers of fruit trees are grown, notably Apples. Although a fairly representative collection is grown, the following are the chief of the varieties most recommended for the district, either as bush, pyramid, or standard trees, viz.:—*Stirling Castle*, *Exeklinville*, *East Lothian Seedling*, *Keswick Codlin*, *Lane's Prince Albert*, much thought of; *Peasgood's Nonsuch*, *Hawthornden*, *Kerry Pippin*, and *Irish Peach*.

Roses are much favoured here, large breadths of them are grown, and the plants showed much vigour, and the wood was getting well matured. A large batch of H.P. seedlings is regarded by Mr. Dickson with considerable interest. They are expected to flower next year in character, but some of them have this season exhibited such signs that we have reason to hope that there will be both novelty and quality among them. *Tea Roses* do finely in the open ground. The season has been such an exceptionally bad one that it was a matter of interest to know what varieties flowered and maintained their character for

quality best throughout. The following are a few out of a considerable list I noted, viz.:—*Alfred Colomb*, *Alfred K. Williams*, *Annie Wood*, *Baroness Rothschild*, *Beauty of Waltham*, *Charles LeFebvre*, *Comte de Rambaud*, *Duchess of Bedford*, *Duke of Albany*, *Earl Dufferin*, *Etienne Levet*, *Gloire Lyonaise*, *Her Majesty*, *Horace Vernet*, *Lady Mary Fitzwilliam*, *Lady Helen Stewart*, *La France*, *La Rosiere*, *Lord Bacon*, *Madame Eugene Verdier*, *Madame Gabriel Luizet*, *Madame Victor Verdier*, *Marie Baumann*, *Merveille de Lyon*, *Mrs. Jowitt*, *Mrs. John Laing*, *Pride of Waltham*, *Prosper Langier*, *Senateur Vaisse*, *Thomas Mills*, *Ulrich Brunner*. It will be noted that among the foregoing thirty-one sorts only three of the most recently introduced have stood the test of a bad season equally well with the best of the standard varieties of older date; the three alluded to are in italics. Among *Tea* and *Noisette Roses* the best during the season were *Boquet d'Or*, *Catherine Mermet*, *Comtesse de Nadaillac*, *Grace Darling*, *François Kruger*, *Madame de Watteville*, *Madame Eugene Verdier*, *Madame Lambert*, *Madame Marie Van Houtte*, *Maréchal Niel*, *Niphetos*, *Perle des Jardins*, *Princess Beatrice*, *Rubens*, *Souvenir d'Elise Vardon*, *The Bride*; of these only the two in italics among the latest introductions have proved themselves insensible to the inclemency of the weather. *William Allen Richardson* had proved itself admirable, and very profuse in buds for cutting.

The general stock outdoors is varied and of very fine quality. *Conifers*, such as *Picea pungens glauca*, *Abies Pattoni*, *A. magnifica*, and *A. nobilis* were very fine, some large specimens of the last named standing in a belt in front of the proprietor's house bearing many fine cones. *Cupressus macrocarpa* and *Pinus insignis*, both of which thrive well and are in great demand in the district, are grown in considerable breadths. The elegant *Gynerium pumilum* was flowering freely and has this advantage over its more imposing relative, *G. argenteum*, that it appears to open its plumes of flowers in districts where the latter hardly forms its sheaths. The finer sorts of deciduous trees are also well represented in the stock, *Acer Schwedleri* was in beautiful colour and placed in fine contrast with *Quercus concordia* and *Acer Negundo variegata* in grand specimens harmonised most pleasingly with the bronze-purple of *Prunus Pissardi*. These with *Fulham* and other Oaks, *Purple Beech* and other deciduous ornamental trees and *Conifers* are displayed in sizes, ample enough to exhibit their respective characteristics in a border of about 200 yards in length by 9 yards wide, extending from the entrance gate along the south boundary of the nursery to the east side of the proprietor's house. A highly illustrative border it is, and one which must prove of great use to the intending purchaser of trees. Along the front, *Olearia Haastii* is found in rounded masses of about 3 feet high and as much through, and flowering so profusely as to resemble snowballs. Altogether the nursery in every department is a most orderly and complete one. Knock is the first railway station out of Belfast, and is the one nearest to Belmont, the distance being about a mile.

### THE NEWTOWNARDS NURSERIES.

These lie just outside the pleasantly situated little town of that name, which is the fourth station on the same line of railway from Belfast. As is well known, they belong to Messrs. Alexander Dickson & Sons. The plant-houses are numerous, and contain a varied assortment of stove and greenhouse plants in healthy condition. Specialties under glass are a good collection of tuberous *Begonias*, *Bouvardias*, *Maidenhair Fern*, *Lomaria gibba*, *Pteris tremula*, &c., which are grown by the thousand, and chiefly for furnishing. Many *Roses* in pots are grown, *Maréchal Niel* having one house of considerable length to itself. A considerable stock of pot Vines occupies another house; they are furnished with short-jointed, well-matured stems.

Of *Chrysanthemums* about 2000 are grown in pots, the blooms being chiefly for cutting, and the varieties are those most suitable for that purpose. They are

very well grown, and promise a fine harvest of bloom. Zonal *Pelargoniums*, double and single, are largely grown. The general stock out-of-doors is similar to that found at the Belmont Nursery. Very thriving stocks of *Cupressus* in variety and various *Retinosporas* occupy considerable breadths, and among the former is one sort of very free growth and highly glaucous hue, and which is much in demand for planting in the breezy country bordering the Clyde. It originated in the nursery, is named *Cupressus Lawsoni* var. *Dicksoni*, and is said to be unaffected by sea winds.

Roses are largely grown, and the stock is vigorous. The seedlings of the Rose, of which there are many here, some being already well known and favoured by rosarians, are being annually tested to ascertain if of any decided merit, and if their good points have permanency. We may mention *Earl Dufferin*, which has already received much attention from Rose growers, and which has fully maintained this season the position it had previously reached; *Lady Helen Stewart*, H.P., has proved itself to be a most trustworthy variety, even this unpropitious season, flowering from June to the time of my visit in the middle of September, with promise of a continuance of bloom to the end of the month at least.

*Caroline Arden*, H.P., which was put in commerce this season by the raisers, will well sustain the character of these pedigree seedling *Roses*. It is come of illustrious parents, viz., A. K. Williams and Marie Baumann. The flowers are large, full, perfectly formed, the petals round, large, and of great substance; the habit vigorous, and foliage bold and massive.

Of *Tea Roses* raised by Messrs. Dickson & Sons, and already put in commerce, I was well pleased with *Miss Ethel Brownlow*, which was introduced last year; and with *Lady Castlereagh*, of this season's introduction. Both are of vigorous growth, with luxuriant handsome foliage, and very profusely blooming and branching habit. The blooms of the former are large and full, the petals of great substance, large, smooth, bright, and of a colour which is salmon-pink shaded yellow at the base. The latter has very large, full, handsome flowers, the petals large, round, and smooth, of a soft rosy-yellow colour, the rose deepening in tint at the margin. Judging it from all points of view, the raisers look upon the last-named as an acquisition to its class. It has been awarded First-class Certificates by the Royal Horticultural Society of Ireland, the Glasgow and West of Scotland Horticultural Society, and the Glasgow Rose Society.

Among the many seedlings of *Roses* under test, but not yet brought out, I noted the following as being, in my opinion, of very high promise:—*Mr. James Brownlow*, H.P., a distinct flower, as well in foliage as in colour, the former being peculiar, strikingly so even at some distance; the blooms are large, full, and beautifully formed, and the colour a novel shade of rosy-carmine. A striking quality of the variety is the readiness with which it starts into flower at any time during the season after it is cut back; of this I had evidence in a number of plants that had been cut back a few weeks ago, and which had broken freely and was flowering from every shoot. I understand it has deservedly received two First-class Certificates this season. *Mrs. James Wilson* appeared to me to be a great acquisition. It is a remarkable vigorous, free-branching variety, and equally free flowering. The flowers are large, of much substance, and in form and build closely resemble those of *Catherine Mermet*; the colour a pale tint of lemon-yellow, appeared to me to be a new one. *Miss Jeanie Dickson*, H.P., is a fine variety, of great promise as a garden or exhibition flower. In habit it is vigorous and free, the flowers are large, globular, the centre high, from which the petals recurve, and thus display their delicate satin substance, the margins of each terminate in a fine silvery tint.

A notable feature in the management of the dwarf *Rose stocks* in both these nurseries is the lowness at which they are budded. The *Manettias* and *Briers* alike are treated in the same way. The stocks are thoroughly disbudded before being planted in the quarters in

FIG. 73.—CÆSALPINIA JAPONICA: HARDY SHRUB; FLOWERS YELLOW; REDUCED ONE-HALF, DETACHED FLOWER REAL SIZE.

which they are to be worked—a point of practice which of course every grower carefully attends to, but here, in order to get the bud inserted at the lowest point in the stock the latter is laid at a very acute angle with the soil, so much so that in baring it, preparatory to inserting the bud, the heel is exposed, and it is at that point the insertion is made. The advantage is obvious—there is less liability to form suckers, and when the plants are to be used in pots there is no difficulty in burying the stock.

In a belt surrounding this nursery, composed of miscellaneous trees and shrubs which had been planted in the earlier years of its existence, some remarkable specimens occur. We noted particularly *Pinus insignis*, in perfect health, about 60 feet high, with boles from 16 to 20 inches in diameter; and *Cupressus macrocarpa* was about 60 feet high and

had assumed its true arboreal character, having spreading dense tops and boles about 18 inches diameter. *Erica codonocles* was to be seen in dense masses from 10 to 12 feet high and as much through, which must have a very striking effect when in flower.

#### CÆSALPINIA JAPONICA.\*

THE plant here figured (fig. 73) is a handsome and very interesting one. It first flowered in 1887 in the Coombe Wood Nurseries of Messrs. Veitch,

\* *Cæsalpinia japonica*, Sieb. et Zucc., *Fann. Nat.*, n. 3; Franchet et Savatier, *Exon. Plant. Jap.*, l. 114; *Gardener's Magazine*, July 21, 1888, p. 443 (with figure *C. crista*, Thunberg, *Fl. Jap.*, p. 179; *C. septaria*, Miquel, *Prolet.*, p. 242 (non Roxburgh).

who introduced it from Japan several years ago. Certainly no other member of the genus has stood the test of the Coombe Wood plant, which can—as far as the South of England is concerned—be added to our lists of hardy shrubs. No doubt, when distributed, *C. japonica* will be welcomed in many gardens; it thrives at Coombe Wood on a sloping bank of gravelly clay and makes long shoots beset with strong hooked prickles. These shoots should not be cut away or pruned back but simply let alone. During the current year flowers were much more freely produced than in 1887, and now the cultivation of the plant is understood, it will doubtless flower abundantly every year.

The genus *Cæsalpinia* contains—according to

Bentham and Hooker—thirty-eight species, and is distributed widely throughout all tropical regions. Several species afford valuable products, for instance, *C. coriaria*, the pods of which are imported from the West Indies and South America for tanning purposes; others yield dye stuffs. The slate-coloured seeds of *C. Bonducella* are largely made into bracelets, necklets, rosaries, &c. This species is a common climber on tropical shores, and in the Kew Museum are exhibited seeds that have been washed up on the shores of Kaffraria, Tristan d'Acunha, and St. Helena; they are also occasionally washed up on the Irish, Scotch, and Norwegian coasts.

The sub-order *Casalpinieæ*, with its seventy-six genera and about 500 species, is only represented in British arboreta by the genus *Casalpinia*, the Honey Locust (*Gleditschia*), St. John's Bread (*Ceratonis*), and the Judas tree (*Cercis*). *G. Nicholson*.

## ROSES.

### ROSES FOR WALLS AND PILLARS.

THERE is no more delightful purpose to which Roses can be put than that of covering walls and houses, or training them to pillars; and for this purpose Roses of a rampant habit of growth, which are most frequently called climbing Roses, are used. The term climbing is a misnomer, for they do not cling to anything unless by artificial means; they have no tendrils like the Vine, no small roots to fasten on the wall as they climb, like the Ivy or Ampelopsis, and must be carefully tended in order to get them to cover the required space; but if the Rose does so it is a joy—I do not say for ever, but for a long time. My own house has its north side covered with climbing *Devonensis*, which is made doubly lovely with the vigorous shoots of a *Wistaria*, *Belle Lyonnaise*, which, like its parent, *Gloire de Dijon*, is somewhat straggling; and *Longworth Rambler*, a dark red hybrid Tea, with close foliage completely covering the wall, and quite a brilliant object when in its full flush of flower; and on the east side I have *Madame Berard*, another straggling grower, and my grand plant of *Rêve d'Or* which was cut to the ground in 1880 and 1881, but is now fast re-occupying the place it was obliged to vacate. On the front of the house facing west I have a plant of *Madame Trifle*, and one of a white summer-flowering Rose which I found here twenty years ago; while I have a few as pillar Roses in the garden itself.

The Roses suitable for these purposes may be roughly divided into two classes—the summer and autumnal flowering ones; the latter are those—unless where there is an abundance of room to grow everything—that I should prefer, and advise others to grow. By autumnal flowering is simply meant that they will give blooms at intervals after the first great bloom is over, in the same way as the hybrid perpetuals and Teas do; in fact, many of them are, as we know, what are called climbing varieties of well known sorts: while the *Noisette* Roses seem peculiarly adapted for these purposes.

Amongst *Noisettes*, *Maréchal Niel* would hold a very high place, but for the habit of hanging its head down, and I have never yet seen it satisfactory in this position. The outside petals become discoloured, and the whole plant has a faded appearance. Of course, when you gather the flowers they are intensely beautiful—I only mean as a wall or pillar Rose. There was one on a cottage not far from this, and although it bloomed for some years most vigorously, yet at a distance it had the appearance of decay. The very first of the *Noisettes* for this purpose is one which, unfortunately, is too tender for general culture—I mean *Cloth of Gold* or *Chromatella*. I have often delighted in one which used to flourish on the front of a house in this parish where it held up its magnificent goblets, not so deep in colour as the *Maréchal Niel*, but with a short foot-stalk and with petals of great substance; while those who have seen it in the South of France or in warm

climes can never use superlatives enough in speaking of it. It will not, however, give much satisfaction out-of-doors in this country except in some very favoured spots.

The *Gloire de Dijon* race contributes some of the very best of the Roses suitable for this purpose. *Gloire* itself is a normal favourite, and since the day when it appeared as a stray seedling in Jacotot's garden walk at Dijon, has run a very successful course, and people who do not know any other Rose are safe when they talk of *Gloire de Dijon*. It will grow anywhere, and is an universal favourite, except in the exhibition box, where it generally manages to open too much, and spoil the appearance of the stand. *Madame Berard* is a beautiful daughter of this Rose, somewhat lighter in colour, but especially valuable for its autumnal blooming, in which respect it exceeds its parent. *Bouquet d'Or* is another Rose of this race, which differs somewhat from the two previously named in that its foliage is more dense and its growth not so straggling; *Belle Lyonnaise* has the straggling propensities of its parent, but is richer in colour, having, however, a very unfortunate propensity of coming into quattered or cleft flowers, which detracts from the beauty of their appearance. I think, however, as far as I have been able to judge, that the deepest-coloured, and freest autumnal bloomer of this race is *Madame Eugene Verdier*, good shape, very rich in colour, and a decided autumn bloomer. I gathered one the other day of the most intense yellow. *Madame Emile Dupuy* is another of this type which has been a good deal overlooked; it is of a pale fawn, the form good, and the foliage ample; it is, I think, one of the best of the pale-coloured Roses of this section.

There are two new flowers in this class, of which I have heard a good deal, but cannot say anything from personal knowledge; to one there attaches a melancholy interest, as it (*Henriette de Beauvean*) is the last Rose sent out by old Lacharme; it is said to be of a bright yellow colour, very free, of good form, and in all respects a desirable Rose; the other is, if its classification be correct—that is, if it is to be counted amongst the *Dijon* race—quite a new break as far as colour is concerned, for *Souvenir de Madame Metral* is described as bright cherry-red with darker shading, of good form, large size, distinct and good. This sounds well, but it will have to be seen whether it is really a pure *Noisette* of the *Dijon* race, or whether there is not some mixture of other races which would make it—like *Reine Marie Henriette* or *Cheshunt Hybrid*—a hybrid Tea. There is, indeed, amongst these so-called climbing Roses the same perplexity that exists in the non-climbers; for example, that most useful Rose, *Rêve d'Or*, to which class is it to be assigned? It is generally placed among the *Noisettes*; but it is very much *en rapport* with the Teas. The *Noisette* Roses are supposed to bloom in clusters, and so *Rêve d'Or* does at times; but it just as often sends out a single bloom, while it is oftentimes stated to be best designated a climbing *Madame Falcot*, and that Rose is unquestionably a pure Tea. Before leaving the class of *Dijon* Teas, I may say that in a favourable autumn all those mentioned are giving nice blooms, which would be better, but that we have very dense mist in the mornings, which, settling on the buds, prevents them from opening as they should do, especially as the air is perfectly still, without a breath of wind to blow the damp off. But St. Luke has been true to his word this year, and his "little summer" has been a great boon after the inclement season we have had.

*Wild Rose.*

(To be continued.)

### ROSE MARQUERITE DE ST. AMAND.

Let this be noted as a beautiful autumnal Rose. A piece of dwarf plants of this variety might have been seen recently in the Royal Nursery, at Slough, flowering freely; and with a very pleasant and soft shade of pink. The freedom with which it was blooming nearly at the close of September, was something remarkable. It is a delightful Rose, well worth planting for its autumn-blooming. *R. D.*

## COLONIAL AND FOREIGN.

### SAHARANPUR AND MUSSOORIE.

THE report of the Government Botanical Gardens for the year ending March, 1888, is before us, from which we see that the cultivation and distribution of Date Palms and Oranges, both matters of much importance to this part of India, is being vigorously prosecuted.

Mr. W. Gollan is now the Superintendent of the Government Botanical Gardens of the North-west Provinces, Mr. Duthie having been appointed to the superintendency of the Botanical Department for Northern India.

### FRUIT IN NEW SOUTH WALES.

Last week we had the pleasure of tasting some deliciously flavoured Grapes and Apples from the famous Calrossy Garden at Tamworth. At this season of the year it is quite astonishing to see well-preserved Grapes, and Mr. J. Patterson is the only gentleman we know who takes the trouble to have Grapes almost all the year round. The Apples were of different varieties, and we must admit that at no time have we seen such a choice collection of Apples as those we saw last week from Calrossy. A nice, large, waxen-like Apple with blush cheeks was a seedling, which Mr. Patterson has named *Home Rule*, while the other varieties were what we feel sure would be profitable for exportation, and in England would bring high prices. Some Australian Apples lately sold in England brought from 2d. to 1s. 4d. each wholesale, and Pears brought as high as 2s. 6d. each, or £5 the case. What will any fruit growers say to these facts? The Hunter River can produce excellent fruits in abundance, and we think that our gardeners would do well to consider the advisableness of sending to England some of the productions of their gardens, in preference to selling all their produce here and then complaining of the low prices. We shall not be surprised to learn that Mr. Patterson is the first Northerner to try the experiment of exportation, and we hope that others will think the matter over, for we feel sure that a good trade could be established in sending fruits to the mother country. *Maitland Mercury*, July 17.

## HOME CORRESPONDENCE.

PINK LORD LYONS.—I quite agree with "R. D." (p. 474) that this Pink deserves to be widely known, and also that it is the best of its colour. Having been successful in propagating this and other varieties of Pinks without bottom-heat, my method may be of use to others who may be desirous of increasing their stock. About the last week in June I put the cuttings in a bed of sandy soil; this I surrounded with a plain flat frame (four 6-inch boards nailed at the corners), then close down with an ordinary light, and keep it close and shaded with calico for about three weeks; and then inure the plants, now rooted, to air and light. About 80 per cent form roots, and make plants, which are strong enough for planting out early in October, or in April, as may be desired. *S. J. S.*

THE GREAT CHISWICK VINERY.—It was a very fortunate circumstance that the Apple-Exhibition at Chiswick, held in this really grand building, should have had overhead it the accompaniment of literally thousands of bunches of the fine and richly-coloured Grapes. The Hampton Court and Cumberland Lodge Vines may be remarkable for the dimensions of each, but the houses they cover are insignificant, after all, as spectacles, compared with the lofty expanse of the Vine-covered roof the great house at Chiswick. Considering how old the Vines are which furnish this huge house, it is a matter for surprise that bunches and berries should be so large, and should so admirably colour and ripen. It is calculated that the house has produced this year some 2 tons of Grapes; that is, of course, an enormous bulk, although not at all excessive, for the wondrous roof area. Some considerable allowance also has to be made for the varieties planted in the

house, which are more choice than productive. To Fellows these excellent Grapes have been selling at 1s. per pound, a very low price indeed when compared with the different quality of the Grapes offered at such price in shops. The Fellows, therefore, have in return for their annual subscriptions some very material financial privileges in the matter of fruit and flower purchase, and can thus easily recruit themselves, plus their other privileges as Fellows, if they wish to do so. Putting the actual weight of the Grape crop at 4000 lb., however, that would give £200—not a bad result; although it is evident that, were the Grapes sold at shop-rates, the return would be much larger. The Grape corridor, planted its entire length with Alicante and Gros Colmar Grapes, shows just now a grand crop, which will certainly secure a much higher price per pound. With the fine show of Apples below, and the Grape crop above, the great vineyard at Chiswick was last week a noble sight indeed. A.

**ASTER HYBRIDS.**—I enclose you two seedling Asters; one, named John Loraine Baldwin, is 5 feet high, and has the largest flower of any of the leavis family. The parents are also enclosed, viz., leavis and speciosus. It takes the size of its bloom from the latter, and its habit from the former. There is also enclosed an improved seedling of Novi Belgii var. densum, having larger blooms. It is only 4 feet in height. As a comparison both the forms are enclosed. E. J. Lowe, Shirenewton Hall. [In reference to the subject of the above note an Aster grower says:—"Aster Novi Belgii var. densus is correct. The seedling is a mere form, and corresponds with a variety of Aster N. Belgii, known in gardens as versicolor maximus. John Loraine Baldwin is no hybrid, but a seedling form of A. N. Belgii. The supposed parents are, first, an old well known variety of A. N. Belgii (not leavis, as stated). The other supposed parent is not an Aster at all, but Erigeron speciosus."]

**PROLIFEROUS SPIKE OF PHALANOPSIS.**—I was much interested on reading Mr. Watson's remarks in the *Gardeners' Chronicle* of October 13, p. 417, on young growth being developed from cut flower-spikes that had been placed in water instead of letting them remain on the plant, which is generally done, and which we here have been in the habit of doing without ever succeeding in obtaining a plant. We have a plant of *Angræcum Leonii* which developed a young growth on the top of a flower-spike two years ago. The young plant has since grown very rapidly, and last spring bore a spike of three flowers. I have never heard of *Angræcum Leonii* having done so before, and I should be pleased to hear if Mr. Watson or any grower of Orchids has met with a similar occurrence. *Erin*. [We have before us, from Mr. Odell, an adventurous bud with roots, produced upon a flower stem of *Phaius grandifolius* after it been cut off and thrown under the stage. Ed.]

**GISHURSTINE.**—In your issue for the 13th ult. you speak of the efficacy of Gishurstine. There is no doubt but this is a good article for waterproofing and softening boots, and would probably be largely used by gardeners if it was sold at a reasonable price by the horticultural trade. This, however, seems to me to be far from the case. Gishurstine is supplied from Price's Patent Candle Company in two sizes, mounted with the company's paper with the prices 3d. and 1s. per tin printed on it, being what I consider too high a price for the said article. I think all readers of the *Gardeners' Chronicle* will agree with me when I say that a chemist's shop is not one's ideal of an establishment for cheap goods, yet I always buy my Gishurstine from a chemist, and though marked with the company's paper and prices as above stated, I can there procure either of the sizes at 25 per cent. below the stated price, viz., at 4½d. and 9d. per tin, being 3d. in the shilling less than the prices demanded by the horticultural trade. Undoubtedly the chemist referred to sells at a paying profit, and if so, what must be the profits of the horticultural trade? Looking fairly at the facts mentioned, I can hardly think the trade have so much pity for gardeners in general as one might suppose from reading reports of speeches published after such dinners as are held, say, for instance, in connection with the *Gardeners' Benevolent Society*. Let us hope the trade will take the hint, and not be above chemists' prices. *Hortus*.

**HELIANTHUS LÆTIFLORUS.**—In my note on p. 483, I wrote "new authority," not "Kew authority;" it appears there was a misprint in the note from

which I copied the words. As now printed it might imply a disrespect for the Kew authority, which I did not intend. The case, however, is "Asa Gray versus Kew," and to settle it I propose to send dried specimens to Harvard to be compared with the authorised type preserved there. C. Wolley Dod, *Edge Hall, Malpas*.

**INSECT PREVENTIVES.**—I notice that on p. 472 of your last issue soap, lime, and Hellebore powder are all recommended for the destruction of caterpillars, but perhaps it is not generally known that gas-tar is a first-rate preventive, which is better than cure. I have had whole plots of Gooseberry bushes devastated by them, and also Cabbage and Cauliflower. Since I commenced to use gas-tar the caterpillars have not made their appearance, and it is both a safe and a cheap remedy for the Gooseberry caterpillar and all others affecting green crops which are subject to attack. *John McIntosh, Glennachan*. [Please say how do you apply gas-tar? Ed.]

**THE NATIONAL APPLE AND PEAR CONFERENCE.**—I was somewhat surprised to find that comparatively few market-growers put in an appearance, or appeared to take any part in the Conference, particularly as they are chiefly concerned in this very important matter. There are a number of large private establishments about the country managed by experienced gardeners, where the finest Grapes, Peaches, Nectarines, and hardy fruits of the best and improved varieties are grown, and in order to help defray the garden expenses, the surplus is sold to supply the best shops. We cannot look to these to supply our markets in sufficient quantities for the million, but must depend upon the market gardeners; therefore it is all-important to get at these gentlemen. I feel sure that had more market gardeners attended we should have heard from them many useful suggestions, and much information as to the effect of soil upon the different sorts of Apples and Pears grown for market in different parts of the country. Mr. Clark, a retired market gardener of Twickenham, however, attended, and entered into the discussion. He gave some useful information upon the destruction of the Apple and Gooseberry caterpillar, and mentioned two market Apples (Mank's Codlin and Early Julien) he used to grow in his neighbourhood with great success. He said "Mank's Codlin" brought him more money from the market than any other sort," and strongly recommended it to be largely planted, observing also that Cellini Pippin Apple was planted in the same ground, but failed through canker. This points to the necessity of taking into consideration the nature of the soil, shelter, &c., before deciding upon the kinds of fruit to be planted. The soil in the neighbourhood of Kew, Chiswick, Twickenham, and many parts of Isleworth, where Mank's Codlin does so well, is of a light, warm, sandy loam, well suited to many kinds which fail to do well in heavier soils. In heavy soils I have found Mank's do very badly, being sometimes quite a failure. I can point at this moment to 1 acre of this sort in Ealing, planted twenty years ago in good but heavy loam, which has never borne a good crop; the trees are now rotten with canker. What a serious loss! In the same ground there are some Lord Suffield; they are not flourishing, as they would be in warmer soil, but even they have borne fairly well. There are also in the neighbourhood of Ealing Cellini being well, which clearly points out how necessary it is for planters to pay more attention to the nature of the soil and to the selection of suitable sorts. I would warn that gentleman who at the Congress asked for information as to what to grow in the heavy soils of Sussex not to take Mr. Clark's hint (grow Mank's), lest he should sustain a loss similar to that my friend at Ealing experienced. I may be told that had the ground upon which this unfortunate acre of Mank's been better drained and received more liberal dressing of manure failure would have been avoided; but you cannot alter the nature of a heavy soil to that of a light one without time and expense. It is all very well in private and small villa gardens, where suitable soil can be supplied or made up, but when the market gardener has to deal with broad acres, with a view to the maximum amount of return for the minimum amount of outlay, he must choose the most suitable sort of Apple and Pears for the natural soils of the place requiring but ordinary treatment in the preparation for planting. Now, had this been observed, and the best hardy strong growing sorts been selected for the orchard in question, such as Keswick Codlin, Ecklinville Seedling, Pott's Seedling, Stirling Castle,

or Blenheim Orange, instead of Mank's, success would have been certain, instead of failure and loss. I am writing with no prejudice against planting this excellent free-bearing market sort, but only to point out the source of danger in planting this or any other sort in unsuitable soil. I would conclude by saying, in the words of Mr. Bunyard, that when a good sort is found to be doing well and to suit the soil, then go ahead and plant it, like the "one Apple" man at Woking, who grows only one sort (Cox's Orange Pippin), finding it does well on the light sandy soil of that place. *George Cannon, Lee's Nursery, Ealing, October 23*.

**BORDER CARNATIONS.**—Your correspondent "A. D.'s" suggestion (p. 417) as to a Chiswick trial of border Carnations should be heartily entertained by all growers of these valuable and now popular flowers. Certain it is that many fine varieties exist which meantime are only known locally; and some of these, when judged from comparison with popularly known and advertised sorts, vastly superior as truly refined flowers, and at the same time free and vigorous in constitution. The popular Gloire de Nancy, for instance, is lacking in one of the first qualities of a commendable flower—the calyx almost always bursts (at least, with us); but may not other whites exist with all Nancy's glories and none of her defects? And if such is the case, what a wealth of joy and beauty is being hidden and withheld! Another defect in many of our now popular border Carnations is the waste of flowers consequent on cutting a bloom with a stalk long enough to conveniently place in water; the buds are crowded at the top, and cutting one open bloom often means the removal of four or five unexpanded buds. May there not be local varieties—one here and another there—in all the leading counties, which have not these defects? As to the grouping of colours suggested by "A. D.," this should be one of the prime factors in all comparative tests of florists' flowers. We have practised this for years in all our stock plantations of such popular flowers as Carnations, Dahlias, Pansies, Pyrethrums, Phloxes, &c. The results are that all synonymous and inferior forms are at once recognised, and any errors in nomenclature are quickly detected, as when a white form appears in a group of scarlets, and *vice versa*, *S. & S., Dundee*. [Some Carnation flowers sent with this note, October 23, were of a fine and sweet, and of charming tints, both selfs and others. They did not show at all that they had had to endure on two occasions 8° of frost. Ed.]

**REMOVAL OF POTATO HAULM.**—I can endorse what your correspondent, Mr. Wall, says at p. 483 respecting the removal of Potato haulm as being a means of preventing the tubers becoming diseased. I had here this season a patch of Myatt's Ashleaf so attacked with disease, and as the haulm was already showing signs of ripeness, I determined to try the experiment. Unlike your correspondent, I had the haulm cut (instead of pulled) close to the ground, cleared away, and burnt, leaving the tubers undisturbed for ten days, so as to allow their skins to set. When lifted there were from 37 bushels only 2 bushels diseased, and not more than half a bushel of tubers have since gone bad. Our other varieties, nine in number, being grown early and late kinds, were left to take their chance, and in each case numbers were diseased varying from one-quarter to two-thirds of the crop. In my opinion the removal of the haulm, either by pulling or cutting (I would prefer the latter, the tubers being less disturbed) as soon as spots of the disease are detected, would be a safe plan to adopt in all cases where the crops are approaching ripeness. *Tom Stone*.

**MALVA MOSCHATA ALBA.**—The typical form of *M. moschata* is by no means devoid of merit as a garden plant, and a well-grown plant, covered with bright pink flowers and beautifully dissected leaves, is infinitely preferable to many of the weedy occupants of the herbaceous border. The white form is a dangerous rival to the white flowers of the hardy plant-garden; there is a certain refinement about the exquisite satin-like petals that is very attractive and pleasing. This is a plant that should have a good soil and plenty of room; under these conditions it forms very handsome specimens. The best results are obtained from one year old plants; if left in the borders after the first year they are apt to become too leafy. When grown on rich heavy soil the seedlings should be transplanted before they form their long tap-roots; this tends to produce a floriferous growth and less foliage. On light soils the

seed should be sown where the plants are to remain. Autumn-sown plants make a fine display early the following summer. The photograph sent was taken from an autumn-sown plant this summer, growing in the gardens of Mr. Geo. Clarke, Pinner. *J. W. Odell.*

**SCABIOSA SNOWBALL.**—When this charming novelty first came under my notice last spring, I was rather doubtful as to its real merit, as it is quite a common occurrence to find white-flowering varieties amongst the mixed German Scabious, of which I grow a large quantity for cutting purposes. Young seedlings planted out in the beginning of May soon formed nice compact bushes about 2 feet high. The large pure white flowers are freely produced in unending succession from the beginning of August until October, and are not unlike a white pompon Dahlia. For cutting purposes the flowers are simply lovely; they not only come in most useful for ordinary flower-glasses, but are as well adapted for making up wreaths, crosses, and other choice designs. I often compared flowers of the new variety with white forms I had in a bed of selected mixed German Scabious, but the Snowball surpassed them by far in form and pureness of colour. I am sure this beautiful hardy annual is quite as deserving of popularity as its predecessors. *C. S.*

## SOCIETIES.

### HORTICULTURAL AND BOTANICAL OF MANCHESTER.

AN exhibition of fruit, flowers, and vegetables was opened on Friday, Oct. 26, at the Botanical Gardens, Old Trafford, and remained open till Saturday. The range of permanent glass is now extensive, immense additions having been made by retaining portions of the structure provided for the Jubilee Exhibition of 1887. The exhibits were set out partly in the annexe and partly in the Palm-house. Apples and Pears were the main features of the show. It has not been a particularly good season for these fruits, but except a general want of colour there was little to complain of in the quality of the exhibits. The Society's Gold Medal for the best collection of Apples was taken by Mr. J. Watkins, Whittington, Hereford, and the Gold Medal for Pears by Mr. A. J. Thomas, Sittingbourne. A collection of Apples and Pears, sent for exhibition by Messrs. J. Veitch & Sons, Chelsea, secured a First-class Certificate. The Messrs. Dickson (Limited), Chester, and Messrs. J. Cranston & Co., Hereford, also sent collections for exhibition. Next in interest to the Apples and Pears were the Potatoes. The collection for which Messrs. Dickson & Robinson, Manchester, were awarded the Society's Gold Medal, included more than 100 varieties, and was in many respects a remarkable exhibit. Messrs. Dickson & Robinson also received a certificate for Onions. Another fine collection of Potatoes, also comprising over a hundred varieties, was shown by Messrs. Dickson, Brown & Tait, Manchester, whom was awarded a First-class Certificate. Messrs. Sutton & Sons, Reading, were also exhibitors in this section. A certificate for seedling Tomatos was taken by Messrs. Dickson, Brown & Tait.

The exhibits of flowers were not numerous. Except a few Cyclamens and Heaths, this department was represented solely by a collection of Gladioli, Roses, Dahlias, Chrysanthemums, and other hardy flowers, grown in the open air at Llandudno by Mr. S. Barlow. The collection spoke volumes for the climate of the popular watering-place. The following is a list of the awards:—

*Nurserymen.*—Collection of Apples.—1st (the Society's Gold Medal), Mr. J. Watkins, Hereford; 2nd (the Society's Silver Medal), Messrs. John Cheal & Sons, Crawley, Sussex; 3rd (the Society's Silver Medal), Messrs. J. Cranston & Co., Hereford.

*Collection of Pears.*—1st (the Society's Gold Medal), Mr. A. J. Thomas, Rodmersham, Sittingbourne; 2nd (the Society's Silver Medal), Messrs. J. Cheal & Sons.

*Animals.*—Twenty-four dishes of Apples.—1st, Earl of Harrington, Elvaston Castle, Derby.

Twelve dishes of Apples, distinct varieties.—1st, Mr. R. H. C. Neville, Wellington Hall; 2nd, Earl of Harrington.

Six dishes of dessert Apples.—1st, Earl of Harrington.

Six dishes of culinary Apples.—1st, Mr. R. H. C. Neville.

Twelve dishes of Pears.—1st, Mr. J. Butler, Sittingbourne; 2nd, Earl of Harrington.

Six dishes of Pears.—1st, Mr. J. Butler.

One dish of Apples.—1st, Earl of Harrington.

One dish of Pears.—1st, Mr. J. Butler.

Eighteen dishes of Apples.—1st, Mr. S. Barlow; Middleton; 2nd, Colonel Wingfield, Shrewsbury.

Nine dishes of Apples, distinct varieties.—1st, Mr. J. Such, Mount Pleasant; 2nd, Colonel Wingfield; 3rd, Mr. S. Barlow.

Four dishes of dessert Apples.—1st, Colonel Wingfield; 2nd, Mr. S. Barlow.

*Fruits Grown within 20 miles of Manchester.*—Twenty-four dishes of Apples.—1st, Mr. A. Smith Barry, Marbury Hall; 2nd, Mr. R. P. Gill, Woodheys Hall; 3rd, Mr. S. Lord, Oakleigh.

Twelve dishes of Apples, distinct varieties.—1st, Mr. A. Smith Barry; 2nd, Mrs. Grundy, Lymm; 3rd, Mr. S. Lord.

Six dishes of Dessert Apples.—1st, Mr. R. P. Gill; 2nd, Mr. S. Lord.

Six dishes of Culinary Apples.—1st, Mr. J. Watts, Abney Hall; 2nd, Mr. A. Smith Barry.

Six dishes of Pears.—1st, Mr. A. Smith Barry; 2nd, Mr. J. Watts, Cheddle.

One dish of Apples.—1st, Mr. R. P. Gill; 2nd, Mr. S. Lord.

One dish of Pears.—1st, Mr. S. Lord.

*Open Classes.*—Collection of Potatoes.—1st (the Society's Gold Medal), Messrs. Dickson & Robinson, Manchester.

### DEVONSHIRE POMOLOGICAL.

OCTOBER 25 AND 26.—The fourth annual exhibition of Apples and Pears was held in Exeter on the above dates. The Lower Market, Fore Street, as on previous occasions was used for making the display of fruit, the long ranges of stalls being draped and festooned with bunting and evergreens, which so altered the appearance of the market, that those who frequent it daily would not have recognised it; this was the handiwork of a few energetic members of the committee. The Society until this season was without a title, so as their labours in the past had been recognised by patrons from all parts of the county, "The Devonshire Pomological Society" was adopted as a most appropriate name; a name calculated to draw support from the whole of the agricultural and horticultural element in the county. That good work has been done by these exhibitions was proved by the grand display held this past week composed of all the principal varieties, new and old, in cultivation, and which showed that since these exhibitions commenced, exhibitors have taken note of many varieties of superior merit and have added them to their collection, and are now able to compete with those of Kent and other favoured counties.

Sir T. Acland, in declaring the show open, said that he could not claim to be an active promoter of this show, although he was much honoured by the invitation to be its President, a former times he had endeavoured, with the help of his friend Mr. Belfield, to promote a knowledge of fruit growing through the *Journal of the Bath and West of England Society*, a Society which, at its meeting in Exeter in 1889, would gladly help on the good work. He (Sir T. Acland) had rather a preference for the early English title—Apple and Pear show. As to the word pomology, he had searched in vain for its origin in Greek. He could only find *poma*, which means drink; and he feared his temperance friends would not like that for one object, though the making of pure and good cider was not to be despised. He read a passage from Lord Carnarvon's pleasing translation of the *Odyssey*, book vii. :—

"Hard by the gates, without the courtyard, lies A goodly orchard, some four acres wide, Fenced in on either hand: within its pale The tall trees stand and blossom: thus the Pear, The bright hued Apple, and Pomegranate grow. The blooming Olive and the luscious Fig, Whose fruit, the livelong year, nor falls nor fades In winter's cold or summer heat; but age. The soft west wind ripens or brings to birth Each in due season. Pear to Pear succeeds, And Fig and Apple, and the clustering Grape Their harvest yield."

This showed that the poet who wrote or rather sang 1000 years before the Christian era was not ignorant of Apples and Pears. From Greek he

turned to Latin, and then referred to an article on Pomona in the *Edinburgh Review*, 1833, to which his attention had been directed by Mr. Josiah Godwin, a man, with a cultivated mind, formerly a leading man in the Exeter press. Pomona was a coy goddess difficult to win. She was courted by Vertumnus, a versatile deity. An old classical authority said that he won his suit by appearing in the guise of an old woman. This might represent the old traditions of Exeter city, *semper fidelis*; but it did not represent the energy of the mayor, who, when Art, or Commerce, or Literature wanted his help was ever ready. A more recent classical authority said that Vertumnus won his suit as a handsome young man. Anyhow, they were much indebted to the Mayor for the present most useful and beautiful exhibition. Sir Stafford and Lady Northcote were present, whose hereditary interest in the trade of England and the welfare of her colonies were well known. To come to a more practical view of the exhibition, there could be no doubt that there was much need for encouraging the growth of fruit on small holdings as well as on farms. He had noticed in the *Gardeners' Chronicle* some speeches laying blame on the landlords for not encouraging fruit growing. To this even this exhibition might afford an answer. But he (Sir T.), was used to being told that all the evils of Society were caused by the wicked landlords. He thought the statements he referred to were somewhat exaggerated. However, there might be need for some alteration in the law as to compensation for the planting of fruit trees. His own gardener, Mr. Garland, had been doing a good deal to introduce better sorts of fruit for sale; he believed that his tenants and neighbours were becoming every year alive to the profit to be derived from this source. If he might venture to urge what he has been told by practical judges, it were better not to think too much about multiplying new sorts, but to find out the few which are most marketable, and to bring them forward, in the best condition, at the season when they were most marketable.

The display of fruit, good for the season, was not so large as usual, neither were size and quality so conspicuous as in former years; colour, more especially was absent to a very great extent, and this is due in a great measure to the sunless and rainless season, for at no time during the whole of last winter, spring, or summer did rain fall in sufficient quantity to reach the roots of the trees. Many varieties did not commence their last swelling until the middle of October. Mr. J. J. Pengelly, the Secretary, worked most indefatigably in carrying out the details and arrangements for the show.

Mr. W. Blackmore, Duryard, Exeter, exhibited a seedling Apple, which was submitted to the judges, who thought so highly of it that a Certificate was given, and named Queen of the Exe. The parents are Cox's Orange Pippin and Blenheim Orange; the fruit is characteristic of each, and said to be an excellent keeper, and of very good flavour.

A large assortment of foreign fruit, comprising magnificent Doyenné du Comice, Glou Morceau, Belle de Gany Pears, and Warner's King Apples, was exhibited by Mr. J. Stokes.

#### APPLES.

*Open Classes.*—Twenty-four dishes, distinct varieties.—1st, Messrs. Bynard & Co., The Old Nurseries, Maidstone, with capital fruits of the following kinds:—Lord Derby, Kentish Filbasket, Belle Dubois, Gospatrick, Tippet's Incomparable, Loddington, very fine; Emperor Alexander, especially large; Queen, Cellini, Fott's Seedling, Queen Caroline, Cox's Pomona, Peasgood's Nonsuch, Ecklinville, Stirling Castle, Warner's King, Lord Suffield, Beauty of Kent, Small's Admirable, New Hawthorn, d'Yler's Kernel, Tower of Glamis, and Bismarck, fine colour. 2nd, Mr. C. G. Slater, Heavitree Nurseries, who had especially fine Peasgood's Nonsuch, Warner's King, Loddington, Lady Henniker, and Lane's Prince Albert.

Twelve dishes dessert, distinct.—1st, Mr. Slater, who had clean and nicely coloured fruit, including Worcester Pearmain, Blenheim Orange, King of the Pippins, Braddick's Nonpareil, Beauty of Wilts, Cox's Orange Pippin, Autumn Pearmain, Ribston Pippin, Cornish Gillyflower, Court Pendu-Plat, and Gravenstein. 2nd, Mr. D. C. Powell, whose best were Worcester Pearmain, Baumann's Red Reinette, Gravenstein, and Claygate Pearmain.

Twelve dishes culinary, distinct.—1st, Mr. D. C. Powell, with a fine clean lot of fruit. His collection comprised Blenheim Orange, Mère de Ménage, Alfriston, Small's Admirable, Peasgood's Nonsuch, Loddington, Gravenstein, Ecklinville, Warner's

King, Lord Derby, Golden Noble, and Brabant Bellefleur. 2nd, Messrs. Bunyard & Co.

Twelve dishes cider Apples, distinct.—This class was very interesting to the farming community, as several were of those varieties from which the best cider is made in the county; 1st, Mr. W. Gibbings, Topsham; 2nd, Mr. W. Slater; 3rd, Mr. P. Slade.

*Amateur Classes.*—Twelve dishes of Apples, distinct.—1st, Mr. R. Teo, gr. to R. B. James, Esq.; 2nd, Mr. Garland, gr. to Sir T. C. Acland.

Nine dishes, dessert, distinct.—1st, Mr. A. C. Williams, with nice fruit, the best being Gravenstein, Blenheim Orange, Ribston, Cornish Gillyflower, King of Pippins, Cox's Orange Pippin, Quarrenden, Margil, and Court Penda-Plat.

Nine dishes, culinary, distinct.—Mr. R. Teo was again 1st with good fruit of the following:—Pott's Seedling, Winter Hawthornden, Lord Suffield, Royal Pearman, New Hawthornden, Ecklinville, and Cellini.

Nine dishes, distinct.—1st, Mr. E. Prothero, who had very good fruit of Warner King, Peasgood's, and Emperor Alexander.

One dish of Apples grown by Devonshire cottagers.—1st, Mr. C. Scadding, with Lord Suffield; 2nd, Mr. J. Hitchcock, with Warner's King; 3rd, J. Potter, with Warner's King.

Heaviest five of any one variety.—The dishes exhibited were not remarkable for their size this season, but were fairly good fruit. 1st, Mr. W. Blackmore, with Warner's King; 2nd, Messrs. Bunyard & Co., with Warner's King; 3rd, Mr. G. H. Mounsdon, gr. to F. Bradshaw, Esq., for Bedfordshire Foundling.

The exhibitors who took prizes in the smaller classes were chiefly those who won honours in the more important competitions.

# PEARS.

Among Pears some exhibitors staged excellent fruit, but on the whole there was a falling off, as in the Apple classes, and from the same causes.

Twelve dishes of Pears, distinct.—1st, Messrs. Bunyard & Co., whose collection included General Todleben, Catillac, Calabrese Grosse, Beurré Clairgeau, B. Rance, B. Superfin, B. Hardy, Pitmanston Duchesse, Doyenné du Comice, Darondeau, Conseiller de la Cour, and Louise Bonne of Jersey.

Six dishes, distinct.—1st, Mr. Powell, all dessert varieties, including Pitmanston Duchesse, Marie Louise, Beurré Superfin, Louise Bonne of Jersey, Muirfowl's Egg, and Beurré Clairgeau.

Three dishes, distinct.—1st, Mr. Powell, with Pitmanston Duchesse, Beurré Superfin, and Muirfowl's Egg. 2nd, Mr. Garland, who had Pitmanston Duchesse, very fine.

# NON-COMPETING FRUIT.

Messrs. R. T. Veitch & Son staged a hundred dishes of Apples, including all the best varieties in cultivation, and forty dishes of Pears. The collection of Apples included Bramley's Seedling, which received a Certificate of Merit at the late Chiswick Apple Congress, and fine fruits of other leading varieties. Pears: Glon Morceau (Certificate of Merit, Chiswick), Beurré Bachelier, Louise Bonne of Jersey, Beurré Rance, Muirfowl's Egg, Beurré Del, Marie Louise, Flemish Beauty. The same firm kindly lent a splendid lot of Palms, Japanese Maples, Bouvardias, &c., for the decoration of the tables.

Messrs. Lumbe, Pince & Co. staged fifty dishes of Apples and eighteen dishes of Pears, including many of the best varieties. Mr. C. G. Slater put up fifty varieties of very fine fruit of Apples and baskets of various kinds of fruit, as usually sold in the markets, making a very pretty stand indeed, all well coloured fruit. Mr. D. C. Powell staged fifty varieties of Apples and eighteen varieties of Pears. Mr. Randall, Exebridge, had thirty varieties Apples and six of Pears, very nice fruit; with a variety of dinner-table plants. Messrs. Jarman & Co., Chard, put up forty-four varieties of Apples, capital fruit, and twenty-one varieties of Pears.

# THE WEATHER.

MEAN TEMPERATURE OBSERVED AT CHISWICK DURING THE WEEK ENDING NOV. 10. (AVERAGE OF FORTY-FOUR YEARS.)

# THE PAST WEEK.

The following summary record of the weather for the week ending Oct. 29, is furnished from the Mete-orological Office:—

"The weather was fair and dry at the commencement of the period, but in the north and west the conditions soon became unsettled and rainy. In the south and south-east, however, fair weather continued until towards the end of the week, when the sky became overcast, and considerable quantities of rain fell.

"The temperature has been much above the mean in all districts. Over 'England, E.' and the 'Channel Islands' the excess has been 4° in most of the other English districts 5°, in Ireland, the greater part of Scotland, and in 'England, N.E.' 7°, and in 'Scotland, E.' as much as 10°. The highest of the maxima were registered on the 27th, when the thermometer rose to an unusually high level for the time of year. In 'England, S.' (in London) the maximum was as high as 70°, and in the 'Midland Counties' and 'England, E.' 69°, while in most other parts of the kingdom readings between 64° and 67° were

recorded. The minima were again low over England until the 25th, the sheltered thermometer falling to between 24° and 30°. During the early morning of the 23rd the gross minimum at Ingatestone was as low as 17°. The temperature subsequently rose with great rapidity, and the minimum readings were very high for the time of year. At Shields, York, and Loughborough the thermometer during the night of the 27th and 28th did not fall below 60°.

"The rainfall has been less than the mean in 'Ireland, N.', and the 'Channel Islands,' and over eastern, central, and north-eastern England, but more elsewhere, especially in the extreme west and north.

"Bright sunshine was very little prevalent except at a few of our extreme southern stations. The percentage of the possible amount of duration ranged from 47 in the 'Channel Islands' to 23 in 'Ireland, S.' and to 22 in 'England, E.' In Ireland, the north-west of England, and the north and west of Scotland the amount was extremely slight, the percentage of the possible number of hours ranging between three and ten."

# MARKETS.

## COVENT GARDEN, November 1.

[We cannot accept any editorial responsibility for the subjoined reports, which, however, are furnished to us regularly every Thursday, by the kindness of several of the principal salesmen, who revise the list, and who are responsible for the quotations. It must be remembered that these quotations represent averages for the week preceding the date of our report. The prices depend upon the quality of the samples, the supply in the market, and they fluctuate, not only from day to day, but often from one day, and therefore the prices quoted as averages for the past week must not be taken as indicating the particular prices at any particular date, and still less can they be taken as guides to the prices in the coming week. Ed.]

BUSINESS quiet; supplies more than equal to the demand. Large consignments of Nova Scotia and Canada Apples to hand; quality better. Kent Cobs short. Prices steadily rising. James Webber, Wholesale Apple Market.

## SEEDS.

LONDON: Oct. 31.—Messrs. John Shaw & Sons, seed merchants, of 37, Mark Lane, E.C., write that the market for Clover seeds has this week assumed a somewhat quieter appearance. Mail advices just received speak badly of the American crop of red; France will, however, have some good seed to spare. Alsike, white, and Trefoil all keep steady. In Winter Tares the tendency is still downward, and the supply now exceeds the demand. Rye is also cheaper. More money is asked for bird Peas. Haricot Beans are likewise higher. For bird seeds the sale is slow.

## CORN.

Averages.—Official statement showing the average price of British corn, imperial measure, in the week ended October 27:—Wheat, 32s. 2d.; Barley, 29s. 3d.; Oats, 16s. 5d. For the corresponding week in 1887:—Wheat, 30s. 1d.; Barley, 29s. 7d.; Oats, 15s. 5d.

## FRUIT AND VEGETABLES.

SPITALFIELDS: Oct. 31.—Supplies not quite so plentiful owing to inclement weather. Trade moderately active at prices as under:—Fruit: Damsons, 3s. to 3s. 6d. per half-sieve; English Plums, 2s. 6d. to 3s. do.; Pears, 3s. to 4s. 6d. per bushel; Apples, 3s. to 6s. do.; 1s. 9d. to 2s. 9d. per half-bushel; English Tomatoes, 3s. 6d. to 5s. per peck. Vegetables: Savoy, 3s. 6d. to 5s. 6d. per tally; Cabbages, 1s. 9d. to 2s. 9d. do.; Cauliflowers, 3s. to 5s. 6d. do.; Brussels Sprouts, 2s. to 2s. 6d. per half-sieve; Greens, 1s. 6d. to 2s. 6d. per dozen bunches; Turnips, 1s. 9d. to 2s. 3d. do.; Carrots, 1s. 6d. to 2s. do.; Onions, 1s. 9d. to 2s. 3d. do.; Beetroots, 2s. to 2s. 6d. do.; Mint, 1s. to 1s. 6d. do.; Parsley, 1s. to 1s. 6d. do.; Celery, 4s. to 9s. per dozen bunches; Horseradish, 9d. to 1s. 2d. per bundle; Dutch Onions, 2s. 6d. to 3s. per bag; Belgian Onions, 2s. to 2s. 9d. do.; pickling Onions, 4s. to 4s. 6d. do.; frame Cucumbers, 4s. to 5s. per dozen; Endive, 1s. 3d. to 1s. 9d. do.; Cos Lettuce, 4d. to 8d. per score of 22; Carrots, 24s. to 35s. per ton.

STRAFORD, Oct. 30.—Both trade and supply have been good during the past week. Quotations:—Cabbages, 3s. to 4s. per tally; Turnips, 35s. to 40s. per ton; Carrots, household, 35s. to 40s. do.; Mangels, 15s. to 20s. do.; Swedes, 17s. to 22s. do.; Celery, 10d. to 1s. per roll; Apples, English, 2s. to 7s. per fat; American, 4s. 6d. to 8s. per hamper; Jersey, 3s. 6d. per half barrel; Pears, 2s. 6d. to 5s. per sieve; Carrots, 2s. to 3s. per dozen bunches; Turnips 3s. to 3s. 6d. do.; Walnuts, 5s. to 12s. per bag; do., 13s. to 15s. per sack.

## POTATOS.

BOROUGH AND SPITALFIELDS: Oct. 30.—Adequate supplies and quiet trade, with very little variation in prices. Regents, 60s. to 80s.; Hebrons, 60s. to 90s.; Early Roses, 50s. to 80s.; Magnum Bonums, 50s. to 100s. per ton.

SPITALFIELDS: Oct. 31.—Quotations:—Beauty of Hebron, 85s. to 100s.; English Regents, 80s. to 90s.; Champions, 60s. to 65s.; Imperators, 70s. to 85s.; Magnums, 60s. to 80s. per ton.

STRAFORD: Oct. 31.—Quotations:—Best Yorks, 83s. to 90s.; Lincolns, 70s. to 75s.; dark Cambs, 60s. to 62s. 6d. per ton.

Imports.—The imports into London last week consisted of 10 bags from Harlingen, 8 from Ostend, 400 bags 207 cases from Hamburg, 5 bags 3 casks from Bremen, and 109 bags from Amsterdam.

## HAY.

Averages.—The following are the averages of the prices obtained at the various metropolitan markets during the past week:—Clover, prime, 90s. to 144s.; inferior, 60s. to 80s.; hay, prime, 90s. to 130s.; inferior, 50s. to 80s.; and straw, 34s. to 48s. per load.

## ENQUIRIES.

"He that questeth much shall learn much."—BACON.

CARICA AURANTIACA.—In the year 1873 this plant was put into commerce by Mr. William Bull, who inserted a figure of it in his Catalogue for that year. Any reader who may have the plant in cultivation will confer a favour on the editor by communicating with him on the subject.

THE BLACK APRICOT (*PRUNUS DASYCARPA*).—Can any correspondent say where this is now cultivated? J. D. H.

VERONICA ERICIFOLIA.—Is there a variety of Veronica with the above name? If so, would you say where it is to be obtained. I cannot find it in any published list. J. C. B., Kelso.

## NOTICES TO CORRESPONDENTS.

INTELLIGENT READERS, DO PLEASE NOTE that letters relating to ADVERTISEMENTS, or to the supply of the Paper, should be addressed to the PUBLISHER, and that all communications intended for publication, as well as specimens and plants for naming, should be addressed to the EDITOR. Such communications should be written on one side only of the paper, and sent as early in the week as possible. Correspondents sending newspapers should be careful to mark the paragraphs they wish the Editor to see.

AMPELOPSIS VEITCHII: H. G. G. The plant is notoriously variable; under glass the leaves become as big as soup-plates. Another time send your question to the editor, not to the publisher.

BOOKS: Ilbert. The best for your purpose is Thomson's *Handy Book of the Flower Garden*. (W. & B. Blackwood & Sons, Edinburgh; new and enlarged edition, 5s.). R. A. Taylor. *Vines and Vine Culture*. By A. F. Barron, Chiswick. *The Garden Calendar*. By T. W. Sanders (Hamilton, Adams, & Co.), is a good general book.

CHRYSANTHEMUMS: X. The flowers are badly affected with a fungus (*Botrytis* or *Polyactis*). Burn the plants. In a dry season perhaps little harm would result, but such a summer as we have lately passed through made things very pleasant for these fungi.

CINDER PATH: J. W. S. The proportion is about a small bucketful of tar to one barrowful of dry coal-ashes, cleaned from the fine particles. The coal-ashes should be screened through a three-quarter-inch mesh, to take out the larger pieces. Cold tar will do. It should be laid on a hard bottom, and the walk should be bordered with roofing tiles or slates.

CORRECTIONS.—In our obituary notice last week of Mrs. Crabbe we named Canon Meadows as one of her competitors; it should have been "Canon Beadon," who died at the age of 101, being at the time of his death the oldest clergyman.—Mr. Buchan informs us that it was to Mrs. Crabbe we are indebted for the introduction of Allamanda Schottii, from whom the original seed was obtained about forty years ago.

DECAYING FERNS: *Palmetta*. Damp and want of air may have something to do with it. Do not sprinkle overhead, but water the pans by sinking them nearly to the brim in water. Apply a little powdered black sulphur and charcoal, and remove to a more airy place.

DENDROBIUM SUPERBIUM: G. W. R. Put the plant in a pot, giving it room. Keep much cooler and more airy than you have it, and give the heat you now give, with plenty of water when growing. If growing now, keep in heat; if not, remove until it starts.

INSECTS: J. Hamilton. The insects are the male and female of the South American grasshopper (*Copiphora cornuta*), very destructive to young shoots and buds. Eggs or the insects have come over with imported plants.—A *Constant Reader*. A larva of *Melolontha vulgaris* (the cockchafer).

MUSCAT OF ALEXANDRIA RIFE BY OCTOBER: *Young Gardener*. Start the house by shutting it up with sun-heat on April 1; in a fortnight apply a little fire-heat to keep up a night temperature of 45° to 50°, but keep as near as you can to the lesser warmth; the day temperature may be 10° to 15° higher. As the Vines near the blooming stage gradually raise the temperature until, when in flower, the night warmth may reach 65° to 68°. The whole method of growing Grapes cannot be described in a paragraph. You should get Mr. Barron's *Vines and Vine Culture*, price 5s. 3d., post-free, of Mr. Barron, Chiswick.

NAMES OF FRUIT: J. Barnett. 1, Early Nonpareil; 2, Brabant Bellefleur; 3, Warner's King; 5, Old Nonpareil.—J. S. 1, King of the Pippins; 3, Fearn's Pippin; 4, King of the Pippins; 5, Cox's

Orange Pippin; 6, Pear Flemish Beauty; 8, Beurré Sterckmans; 9, Beauty of Kent.—C. Cundy. 1, Pear Dr. Jules Guyot; 2, Apple Golden Requette; 3, Pigeonette.—C. F. P. 2, Beurré Clairgaut; 3, Beurré Bosc; 4, Beurré d'Amans; 5, Beurré Hardy; 6, not known; 7, Marie Louise.—Whitton. Apple Scarlet Nonpareil.—J. E. Nelson. 1, Beurré d'Amans; 2, Spice Apple; 3, London Pippin; 4, Hambleton Deux ans; 5, Williams' Bon Chrétien; Plum Jefferson.—B. M. O. Pear Urbaniste.—W. Diddams. Landsberger Requette.—John Prince. 1, Duchesse d'Angoulême; 2, Braddick's Nonpareil; 3, Brownlee's Russet; 4, Sturmer Pippin; 5, Hambleton Deux ans; 6, Dumelow's Seedling.—W. B. Troughton. 1, Beurré Bosc; 2, Beurré d'Arenberg; 3, Beurré de Capiaumont; 4, Beurré d'Amans; 5, Madame Treve; Apple Queen Caroline.—R. C. R. Pear Louise Bonne de Jersey; Apple next week.

NAMES OF PLANTS: J. Humphrey. 1, 2, and 3, varieties of *Epiphyllum truncatum*; 4, *Cereus Wallichii*, a hybrid from *C. speciosissimus* and *C. flagelliformis*.—J. H. 5, *Oncidium pretextum*.—G. Martin. 1, imperfect unexpanded buds only sent—you must think we are wizards; 2, *Eleione* (*Coleogyne*) *laganaria*; 3, not recognised; 4, *Goodyera* sp. leaf should have been sent with the plant; 5, *Pleione* (*Coleogyne*) *Wallichiana*.—G. M. Hibiscus sp. which will endeavour to give you a name for next week.—F. G. 1, *Thuja occidentalis* var. 7, *Retinospora obtusa*; 8, *Cupressus Lawsoniana*; 9, *Juniperus* sp.; 11, 12, forms of *Thuja occidentalis*; 13, *Biota orientalis*. We give the specific names, but to ascertain the variety you should apply to some nursery where they are grown.—Vesta. Probably the Sheep's Fescue, *Festuca ovina*.—F. T. Clarkia pulchella.—B. R. O. 1, Aster, specimen insufficient; 2, *Solidago nemoralis*.—W. S. C. P. 1, *Carduus defloratus*.—S. F. S. *Meembryanthemum blandum*. Treat in the same way as for the other species of the genus; it needs no special culture.—H. J. C. 1, *Statice*, specimen insufficient; 2, *Ballota acetabulosa*; 3, *Verbascum*, perhaps *V. sinaiticum*; specimen insufficient; 4, *Elepharis edulis*; 5, *Centaurea hylaeopsis*; 6 we do not recognise from the scrap sent. Probably from the locality you name.—G. J. All varieties are forms of *Pleione* (*Coleogyne*) *Wallichiana*.—Old Subscriber. 1, *Adiantum Capillus-veneris*; 2, *A. macrophyllum*; 3, *Pteris cretica*.—A. Paterson. *Oncidium trifolium*; *Dendrobium longicornu*; *Zygopetalum Mackayi* (small variety); *Rodriguezia planifolia*. Thanks for the monstrous bloom: it is O. Forbesii, not O. crispum.—Colonel Cooper. 2, *Cattleya bicolor*.

PEARS: G. Benington. Pitmaston Duchess is fine in appearance, and does best on the Pear stock. It should be grown on an east or west wall, or as an espalier, if the district be a warm one. Owing to its size, it is apt to get blown off free standing trees. The flavour is not first-rate, but it is a showy fruit, and looks well at table. Doyenné de Boussoch is a good-looking fruit, and does well on the Quince as a bush—not a pyramid—the habit being too diffuse. As regards flavour it is fairly good, but there are better ones. In cold soils it requires a wall to mature it properly. Coming in at the same time (October), *Conseiller de la Cour* and *Marie Louise* are better. The former on the Quince is very good. Glou Morceau is a very variable variety. The fruit is finest in deep, well-drained soils; in shallow and cold ones it comes malformed, cracks, and is often very gritty at the core, and is then best grown on a wall as an oblique cordon on the Quince, or as a fan or horizontal-trained tree on the Pear stock. The roots in cold soils must be kept near the surface by top-dressing with decayed manure, and being lifted at intervals of five or six years. The season has been very unfavourable for most varieties of Pears in any but the finest soils and situations.

PINE-APPLE: M. F. G. The accounts of Pine-apple culture by the old fathers of the craft are scattered through the garden literature of the past fifty or sixty years, and we may only indicate a few names of gardeners and the weights of the fruits shown by them. Mr. Hatch, an Enville, 7 lb. 3 oz., shown at the Royal Horticultural Society, November 3, 1841. Sir H. S. Clarke's gardener, showed the same variety the following year; it weighed 7 lb. 7 oz. Mr. Lumsden, the same year, showed *Black Antigua*, of 5 lb. 4 oz.; Mr. Foster, a Montserrat of 6 lb. 6 oz.; and Mr. Linwood, Green

Antigua, of 5 lb. 12 oz. In 1843, Mr. Murray showed a Queen, of 6 lb. 4 oz.; and the next year Mr. Mills showed a Providence, 14 lb. 4 oz. In 1845, the heaviest Queen of that year, a fruit of 6 lb. 11 oz., was shown by Mr. Hewitt; Mr. Barnes, of Bilton, showed two Queens in 1846, weighing 7 lb. 4 oz. and 7 lb. 2 oz. respectively; and M. Pelvian, Meudon, one of 8 lb. Mr. Fleming, of Trentham, showed several Ripley Queens in 1849, of 7½ lb., 7 lb., and 7 lb. 10 oz. In 1873 Mr. Sandford showed a Queen weighing 8 lb. 4 oz.; and in 1878, Mr. Miles, a new Pine-apple, Lord Carrington, weighing 7½ lb. On September 25, this year, Mr. Richards, gardener, Somerley, showed at the Drill Hall, James Street, a Queen of 7 lb. 6½ oz. in weight. Fish, Ingram, Ayres, Frost, Bailey, McEwen, Miller, Spencer, and Dods, were great men in Pine growing, and showed continually very large fruits.

**PURPLE BEECH FROM SEED:** *Young Nurseryman.* The seeds are sometimes employed—a certain proportion nearly always coming true.

**VINES:** *Foreman.* We do not see any Phylloxera, but some of the roots are in a bad state. Send some further specimens later on.

**YEW TREE:** *Hatter.* We cannot advise you. If the tree belongs to your neighbour, why not confer with him as to its removal in a legitimate way?

### CATALOGUES RECEIVED.

M. V. LEMOINE, Rue du Montet, 134, Nancy, Meurthe et Moselle.—Extracts from Price List, and Supplement to List of Novelties.

## R. HALLIDAY & CO.,

HOthouse BUILDERS and HOT-WATER ENGINEERS,

### ROYAL HORTICULTURAL WORKS, MIDDLETON, MANCHESTER.

Vineries, Stoves, Greenhouses, Peach Houses, Forcing Houses, &c., constructed on our improved plan, are the perfection of growing houses, and for practical utility, economy, and durability cannot be equalled. We only do one class of work, and that THE VERY BEST.

Conservatories and Winter Gardens designed architecturally correct without the assistance of any one out of our firm, from the smallest to the largest. Hot-water Heating Apparatus, with really reliable Boilers, erected, and success guaranteed in all cases. Melon Frames, Sashes, Hotbed Boxes, &c., always in stock.

Plans, Estimates and Catalogues free. Customers worked on in any part of the Kingdom.

Our Maxim is and always has been—

**MODERATE CHARGES. FIRST-CLASS WORK. THE BEST MATERIALS.**

**SPEARMAN'S SERGES.—THE BEST IN THE WORLD.**—Pure INDIGO DYE, ROYAL NAVY BLUE, WOADED BLACK. Also in all other colours and FANCY WEAVINGS. Low quotations. No draper or tailor sells SPEARMAN'S renowned Serges; they can only be obtained direct from SPEARMAN, SPEARMAN, PLYMOUTH. No material manufactured is so useful for Ladies' Autumn and Winter Wear or Gentlemen's Suits. Send for patterns, and select at home for your-selves. Parcels carriage paid in Great Britain and Ireland. Goods packed for export at lowest freights.

duced up to the present time; and a Calendar of Operations to  
be performed during each month throughout the year.

## DR. SMILES'S WORKS.

LIVES OF THE ENGINEERS. Illustrated.  
5 vols. 7s. 6d. each.

"We cannot but refer to the captivating and instructive  
volumes, which Mr. Smiles has devoted to the 'Lives of the  
Engineers,' a record not before attempted of the achieve-  
ments of a race of men who have conferred the  
highest honour and the most extensive benefits on their  
country."—*Edinburgh Review*.

LIFE OF GEORGE STEPHENSON. With  
Illustrations. 21s., 7s. 6d., or 2s. 6d.

"We have read this book with unmingled satisfaction.  
We hardly ever remember to have read a biography so  
thoroughly unostentatious. It is an artless attempt  
to set out the character and career of one of the most in-  
genious, honest, resolute, homey, and kind-hearted of  
humans, being a record of his life and work in un-  
biased, lucid, thoroughly manly, and good."—*Saturday  
Review*.

JAMES NASMYTH, ENGINEER: AN AUTO-  
BIOGRAPHY. Illustrated. 6s.

"The whole range of literary biography may be searched  
in vain for a more interesting record of an active, useful,  
successful, and happy life, than is presented by the deli-  
cious autobiography of James Nasmyth."—*Edinburgh Review*.  
A few copies of the Large Paper Edition, with Portrait  
etched by Rajen, 8vo, 18s., may still be obtained.

Estate Sales.  
The best County medium for Advertising Sales of  
Estates is  
THE WORCESTER HERALD, the largest  
and leading County paper. Extensive circulation among  
the upper and middle classes in Worcestershire and adjoining  
counties. Advertisers would well to forward for reference  
and distribution, plans and particulars of Estates, Catalogues  
of Machinery, Furniture, Books, and other property advertised  
in the columns of the *Worcester Herald*. Specimen copies sent  
free. Published Friday for Saturday, price 2d.  
Offices, 72, High Street, Worcester.

Sales of Stock and Agricultural Effects.  
THE WORCESTER HERALD is the most  
effective organ for giving publicity to announcements of  
this class. It is the largest and leading Agricultural paper in  
the county, and circulates most extensively among Agricul-  
turalists in and around Worcestershire. Specimen copies free.  
Published Friday for Saturday, price 2d.  
Offices, 72, High Street, Worcester.

Farms to be Let.  
LAND AGENTS, ESTATE MANAGERS, and all having Farms  
to Let, would do well to Advertise in  
THE WORCESTER HERALD, the Largest  
and leading County Paper. Specially adapted for  
bringing such notices before Tenant Farmers. Large Circula-  
tion, moderate charge. Specimen free. Price 2d. Published  
Friday for Saturday.  
Offices, 72, High Street, Worcester.

HOW TO GROW ASPARAGUS.  
A popular explanation of the best Method of Culture.  
By WILLIAM EARLEY. Price 1s. stitched.

HOW TO GROW MUSHROOMS.  
By WILLIAM EARLEY. Price 1s. stitched.  
London: BRADBURY, AGNEW, AND CO., 9, Boulevard  
Street, E.C.

West End Florists.  
WANTED, an experienced practical working  
FLORIST, with £300 to \$400, to join a Gentleman in  
an established concern.—Full details will be given on applica-  
tion to Messrs. FRITH and CLARKE, Accountants, &c.,  
20, Bedford Row, W.C.

WANTED, a HEAD GARDENER, for the  
Country—thorough all-round. Age not less than 35.  
First-class references as to efficiency and character required.  
Three Under gardeners kept.—M. M., Langham Hotel, London.

**WANTED, a HEAD WORKING GARDENER**—Must have a thorough experience in all branches both indoor and out, be particular, tidy, and able to do Floral Decorations. A married man without encumbrance preferred. The wife to undertake Laundry. Age between 30 and 40. A good character from last employer indispensable, whose gardens it is absolutely necessary advertiser should inspect.—Apply by letter to H. W., Bates, Hendy & Co., 31, Walbrook, London, E.C.

**Gardener, with wife to take Laundry.**  
**WANTED, a married MAN**, without family, competent as a Gardener, and whose wife can undertake the work of the Laundry.—Write, giving full particulars as to age, experience, and all other details, DICKSONS (Limited), Chester.

**WANTED, a NURSERY PROPAGATOR**—A rising young man, who has been a Nurseryman, and can grow and propagate two things—Clematis and Rhododendrons. He must start at a moderate wage, and he will be under close supervision until he proves his capability and reliability.—CHARLES NOBLE, Hagshot.

**A YOUNG GERMAN PROPAGATOR**  
**WANTED, a YOUNG MAN** in a Country Nursery.—Application by letter to Mr. J. B. HALL, 10, Wellington Street, W.C. *Gardeners' Chronicle* Office, 41, Wellington Street, Strand, W.C.

**WANTED, a young MAN**, with a knowledge of Nursery Work, indoors and out. Must be quick and willing. Wages to commence at 15s. per week.—Apply, with references, to MANAGER, Rose Nurseries, Sandgate, Sheffield.

**WANTED, a YOUNG MAN**, for Kitchen Gardens and General Outside Work. Must be strong, good workman, and perfectly sober.—Apply, with references, to E. BURN, Head Gardener, Ben Khydding, by Leeds.

**The Seed Trade.**

**WANTED, THREE or FOUR ASSISTANTS**, for Shop and Warehouse.—Apply, stating age, experience, wages required, together with copies of testimonials, to DASHIELL BROS., Royal Norfolk Seed Establishment, Norwich.

**GARDENING APPOINTMENT.**

**Mr. ALEXANDER HENBEST**, late Gardener to H. L. GASKELL, Esq., Kiddington Hall, has been appointed Gardener to A. KENNARD, Esq., Crawley Court, Winchester.

**WANT PLACES.**

Letters addressed "Poste Restante" to initials or to fictitious names are not forwarded, but are at once returned to the writers.

**NOTICE TO ADVERTISERS**—In many instances Remittances in Payment of Repeat Advertisements are received without name, address, or anything beyond the name of the advertiser, which is sufficient to identify the sender. But in all cases causes a very great deal of trouble, and frequently the sender cannot be identified at all.

Advertisers are requested when desiring to give their names and address, and also a reference to the Advertisement which they wish repeated.

**POSTAL ORDERS**—To Advertisers, Subscribers, and Others.—It is very important in Remitting by Postal Order that it should be filled in payable to Mr. J. B. HALL, 10, Wellington Street, W.C., or, unless the name of the advertiser is known, and it has been made payable at a particular office, and to a particular person, it is impossible to prevent any person into whose hands it may fall from negotiating it.

N.B.—The best and safest means of Remitting is by POST-OFFICE ORDER.

**SCOTCH GARDENERS.**

JOHN DOWIE (of the late firm of Dowie & Laird), Seedsman, 144, Princes Street, Edinburgh, has at present on his list a number of SCOTCH GARDENERS, waiting for engagements. He will be pleased to supply full particulars to any Lady, Nobleman, or Gentleman requiring a trustworthy and competent gardener.

**RICHARD SMITH AND CO.** beg to announce that they are constantly receiving applications from Gardeners, seeking situations, and that they will be able to supply any Lady or Gentleman with particulars. &c.—St. John's Nurseries, Worcester.

**Head Gardeners.**

**JOHN LAING AND SONS** can at present recommend with every confidence several energetic and practical MEN of tested ability and first-rate character. Ladies and Gentlemen in want of Gardeners and Bailiffs, or of LAND and HOUSE GARDENERS for Estate Establishments or Single-handed Situations, can be suited and have full particulars by applying at Stanstead Park and Rutland Park Nurseries, Forest Hill, London, S.E.

**To Noblemen and Gentlemen requiring Land Agents, STEWARDS, BAILIFFS, or GARDENERS.**

**JAMES CARTER AND CO.** have at all times upon their Register reliable and competent MEN, several of whom are personally well known to Messrs. CARTER. Enquiries should be made to 251 and 253, High Holborn, W.C.

**Gardeners, Foresters, Land Stewards.**

**R. B. LAIRD AND SONS** can recommend with every confidence Scotchmen, thoroughly qualified as GARDENERS, FORESTERS, or LAND STEWARDS, either for large or small establishments, and will be pleased to furnish full particulars on application.—17, Frederick Street, Edinburgh.

**J. AND R. THYNE, NURSERYMEN**, Glasgow, can always RECOMMEND MEN of known character and ability as GARDENERS to any Lady or Gentleman requiring such. Applications solicited.

**GARDENER (HEAD).**—Age 30; practical knowledge of the general routine of Gardening. Renovation of Grounds, &c.—J. W. HALL, Ivy Cottage, Beedingwood, Hordsham, Sussex.

**GARDENER (HEAD).**—Age 36; twenty-one years' practical experience in first-class establishments. Exceptional testimonials and references.—W. AND J. BROWN, Nurserymen, Graftonham.

**GARDENER (HEAD);** age 35, married.—JOHN F. RAGGETT, late Head Gardener for Lord Hynton, is at liberty to engage with anyone requiring a sound practical Gardener, versed in all branches of the profession. Total—Mersey Gardens, Redhill.

**GARDENER (HEAD).**—Age 33; eighteen years' practical experience in all branches; five years in last situation. Highest references as to character and abilities from present and previous employers.—W. SCOTT, The Gardens, Sherborne House, Northleach, Gloucestershire.

**GARDENER (HEAD).**—Age 35, married; twenty years' practical experience in Early and Late Forcing of Fruit, Flowers, and Vegetables, the Cultivation of Stove and Greenhouse Plants, Orchids, &c., also Kitchen Gardens and Pleasure Grounds. Good character.—J. FINLAYSON, The Gardens, Combe Barn, Sevenoaks.

**GARDENER (HEAD).**—Age 36, married; thoroughly experienced in Early and Late Forcing of Fruit, Flowers, and Vegetables; also Flower and Kitchen Gardening. F. or years as Head. Excellent character and testimonials.—J. B. The Cottage, Holland's Road, Teignmouth, Devon.

**GARDENER (HEAD),** where two or more are kept; age 30, married.—A LADY wishes to recommend her Head Gardener as above; thorough practical experience in all branches, Early and Late Forcing, Flower and Kitchen Garden. Highest references from previous employers.—J. M. 27, Myrtle Terrace, Weymouth, Dorset.

**GARDENER (HEAD WORKING).**—Age 31, single at present; fifteen years' experience in all branches. Excellent references.—D. CARSTAIRS, Muirfield Gardens, Loanhead, Edinburgh.

**GARDENER (HEAD WORKING).**—Age 39, married, one daughter (age 13); twenty-four years' experience. Good all round references and testimonials.—C. C. 21, St. John's Road, Upper Holloway, N.

**GARDENER (HEAD WORKING),** where three or four are kept.—Age 33, single; fifteen years' practical experience. Eight years' good character.—F. K. 18, Villiers Street, Lee Street, Oldham, Lancashire.

**GARDENER (HEAD WORKING).**—Age 43, married; understands Vines, Cucumbers, Melons, &c.; Flower and Kitchen Garden. Good Rose Grower. Twenty-two and half years' excellent character. Near London preferred.—H. GODDARD, Berkswell, Coventry.

**GARDENER (HEAD WORKING);** age 29, married; abstainer.—REV. GARDENER, to G. LIVER, Esq., Camden Park, Tunbridge Wells, is open to engage with any Lady or Gentleman requiring a Gardener with a good practical knowledge of the profession. Good personal character and present employer.—Gardener Cottage, St. Peter's Street, Tunbridge Wells.

**GARDENER (HEAD WORKING OF GOOD SINGLE-HANDED).**—Age 33, married (children); seventeen years' experience indoors and out. Three years' character.—W. HOWARD, 11, Claremont Villas, Broomfield Street, Mill Lane, N.W.

**GARDENER (HEAD WORKING OF GOOD SINGLE-HANDED).**—Experienced in all branches. Highly recommended.—G. A. Kingston, Stourhead, Gloucester.

**GARDENER.**—Practical experience from early life in all branches; good testimonials. Abstainer.—G. HODGSON, 33, Castl. gate, Graftonham.

**GARDENER; unmarried.**—A GENTLEMAN wishes to recommend his Gardener, who has been with him four years. He is steady, honest, obliging, and sober. First-class Fruit, Plant, and Orchard Grower.—R. B. WHITE, Ardarauch, Garelach Head, N.B.

**GARDENER.**—First-class Grower of Chrysanthemums, Cucumbers, Melons, Tomatoes, and Winter Flowers. Well up to Stove, Greenhouse, Fruit, Flower, and Pleasure Gardens. A knowledge of Orchids. Where under one kept preferred.—GARDENER, 3, Red Cottage, Tinsley Road, Wansted, E.

**GARDENER (SINGLE-HANDED).**—Age 23, married; eight years' experience in Houses, Kitchen and Flower Gardens.—K. EARLEY, Woolton Hill, Newbury, Berks.

**GARDENER (THIRD or FOURTH),** where others are kept, or to Assist in a Garden; age 18.—A LADY strongly recommends a young man as above.—Mrs. CROXALL, Shutehill, Warwickshire.

**GARDENER (UNDER);** age 22.—H. LAW can recommend a young man as above. Seven years' experience.—H. LAW, Gardener, West Cliff Hotel, Folkestone, Kent.

**Trade.**

**FOREMAN (WORKING).**—Age 31, single; thorough experience in all branches. First-class Wreaths, &c. Good Saleman. Excellent references.—M., 9, Grove Place, Acton, W.

**To Nurserymen.**

**FOREMAN, or as FOREMAN and PROPAGATOR, or as GROWER**, where Out Blooms are required in quantity.—ALPHA, 179, Highgate Road, Sparkbrook, Birmingham.

**NURSERY FOREMAN (GROUND or GENERAL).**—Upwards of twenty years' active practice in all departments. Highest references.—T. HOLMES, 54, Davies Street, Berkeley Square, W.

**Nurserymen.**

**PROPAGATOR and GROWER, or GROWER and SALESMAN.**—Age 29, married; good all-round man. State wages.—G. ARCHER, 1, Harold's Cottages, Talbot Road, Twickenham.

**To Nurserymen and Florists.**

**PROPAGATOR and GROWER.**—Age 29; good Salesman and Bouquetist. Fourteen years' practical experience. Can be highly recommended.—E., 2, Vigo Crescent, Bedford Road, Northampton.

**PROPAGATOR (SECOND).**—Age 22; understands Soft-wooded Stuff, Tomatoes, &c. Highest references.—J. HOLLIS, Fern Bank Nursery, Fairholt Road, Manor Road, Stoke Newington, N.

**To Nurserymen.**

**PROPAGATOR (ASSISTANT),** Hardy.—Young; five years' experience, three and a half with Messrs. Veitch & Sons.—ASSISTANT, 51, Aberdeen Road, Upper Edmonton.

**JOURNEYMAN, Indoors.**—Young; five years' good character.—J. SMITH, The Gardens, Newstead Abbey, Notts.

**JOURNEYMAN, in the Houses.**—Age 20; six years' experience. Two and a half years' good character from last situation.—W. DAVEY, Alphonso, Essex.

**JOURNEYMAN, Inside or Out.**—Age 20; five years' good character from present situation. Industrious and obliging.—W. F., Moreton Gardens, Bideford, Devon.

**JOURNEYMAN, Inside in a good Private Garden.**—Age 21; two years' in present situation.—For character apply to G. C. MAYNARD, Coleorton Gardens, Ashby-de-la-Zouch.

**JOURNEYMAN, in a good Garden.**—Age 22; four and a half years in present place. Well recommended.—E. BENGOUGH, The Gardens, Suggall Hall, Eccleshall, Staffordshire.

**IMPROVER, or UNDER GARDENER.**—Age 19; four and two years in previous situations. Steady and willing to be generally useful.—W. BENNETT, Bridge End, Colstonhorst, Grantham, Lincoln.

**IMPROVER, in a Gentleman's Garden.**—Age 17; strong and active. Good character from present employer. Two years in the Garden.—F. NAYLOR, Keppel Cottage, Sudbury, Middlesex.

**TO MARKET NURSERYMEN.**—Wanted, by a young man (age 18), a situation in a Market Nursery; five years' experience; quick at Fitting, Tying, and Watering. Good character.—K. F., 3, Lime Cottage, Whitla Road, Manor Park, E.

**TO HEAD GARDENERS.**—Wanted to place a L-d (age 11) under good Head Gardener, where he would be Lugal and Premium will be given. State all particulars to Mr. BAKER, 71, Brook Street, Grosvenor Square, W.

**TO HEAD GARDENERS.**—Strong youth (age 17), anxious to Learn. Both, Liberal Premium.—W. T., 16, Portland Terrace, Piccadilly, Cheltenham.

**TO FRUITERERS and FLORISTS.**—Man and Wife require Management. Fruiterers and Florists. Thorough Salesman, Buyer. Educated. Twenty years' experience. Undeniable character.—GLENFIELD, Kent Villa, 57, Crystal Palace Road, East Dulwich, S.E.

**SEED TRADE.**—Advertiser is open for re-engagement. Wholesale or Retail. Eighteen years' experience. Married.—J. Y., *Gardeners' Chronicle* Office, 41, Wellington Street, Strand, W.C.

**TRAVELLER, in the Nursery and Seed Trade.**—Experienced in all branches. Good connection in the Midlands and Northern Counties. Good reference.—RELIABLE, 156, Woodhouse Lane, Leeds.

**SHOPMAN;** where good brisk trade is done preferred.—Age 30, married; fifteen years' experience. Excellent references.—*Gardeners' Chronicle* Office, 41, Wellington Street, Strand, W.C.

**HOLLOWAY'S PILLS** are strongly recommended to all persons who are much reduced in power and condition, whose stomachs are weak, and whose nerves are shattered. The beneficial effects of these Pills will be perceptible after a few days' trial, though a more extended course may be required to re-establish perfect health. Holloway's medicine acts on the organs of digestion, and induces complete regularity in the stomach, liver, pancreas, and kidneys. This treatment is both safe and certain in result, and is thoroughly consistent with observation, experience, and common sense. The purification of the blood, the removal of all noxious matter from the system, and the excitement of gentle action in the bowels, are the sources of the curative powers of Holloway's Pills.

# SANDER & CO.

WILL OFFER FOR SALE THE NEW

## CYPRIPEDIUM ELLIOTTIANUM,

AT

MESSRS. PROTHEROE AND MORRIS'S Auction Rooms, Cheapside, E.C., on the 16th of NOVEMBER next. A description, by Professor Dr. REICHENBACH, of this brilliant Novelty will shortly appear in the *Gardeners' Chronicle*, and a Coloured Drawing by MOON will be on view on the day of Sale, painted from a plant that flowered at St. Albans. The Plants are in splendid order and condition, and among them will be found many grand masses. We would draw the attention of Buyers to the many distinct-looking forms among the Plants offered.

CONTRACTORS TO HER MAJESTY'S WAR DEPARTMENT.

## THE THAMES BANK IRON COMPANY

(Telegraphic Address—"HOT-WATER, LONDON." Telephone—No. 4763.)

Have now pleasure in bringing to the notice of Horticulturists and Gardeners generally their

### NEW PATENT (No. 9090, 1888) HORIZONTAL TUBULAR BOILER, WHICH IS WITHOUT DOUBT THE BEST ALL ROUND BOILER IN THE MARKET.

It combines all the advantages of its class so well known, and by the improved method of forming the joints — viz., with India-rubber Washers—THE OLD AND TOO OFTEN INEFFECTUAL WAY OF CAULKING THE JOINTS IS ENTIRELY DISPENSED WITH.

SECTION OF PATENT JOINT.

It can be erected in a few hours, and may be relied upon as a thoroughly sound and good Hot-water Generator. It has been carefully tested in every possible way, more especially with regard to power and durability, and the result has been highly satisfactory.

THE LARGEST AND MOST COMPLETE STOCK OF  
**HOT-WATER BOILERS OF EVERY DESCRIPTION,**  
PIPES, CONNECTIONS, VALVES, VENTILATING GEAR, &c.

## Barnet, N.

By order of the Court of Chancery. Cornwall v. Cornwall. SALE of the old-established NURSERY BUSINESS as a going concern, and also about 6 acres of FREEHOLD and COPYHOLD LAND.

**MESSRS. PROTHEROE AND MORRIS** are instructed to SELL by AUCTION, at the Mart, Tokenhouse Yard, London, E.C., on FRIDAY, November 30, at 2 o'clock precisely, the following properties:—  
1.—The old-established NURSERY SEED, and FLORIST'S BUSINESS, known as the HADLEY NURSERY, Barnet, N., occupying a good position in the best part of the High Street, within eight minutes' walk of the High Barnet Railway Station. The property comprises about 16 acres of ground, with eight Greenhouses, Dwelling-house, and Seed Shop, the whole held for an unexpired term of about fifteen years at the moderate rental of £25 per annum. The good will of the Business carried on for so many years will be included in this lot.

Lot 2.—About 6 acres of valuable FREEHOLD and COPYHOLD BUILDING or NURSERY LAND, known as the COMMON NURSERY, Barnet Common, possessing long frontages to the main road, and to Union Lane in the rear.

Lot 3.—Two acres of LAND, opposite Lot 2, held at £7 per acre.

This Sale offers an unusual opportunity for any one desirous of embarking into the Nursery Business. The whole of the STOCK IN TRADE will be sold by public auction, thus enabling purchasers to secure any such stock as may be required for carrying on the business at unreserved auction prices.

Particulars and Conditions of Sale may be had on the Premises; of Messrs. GOWING AND CO., Solicitors, 40, Finsbury Pavement, E.C.; and at Barnet, Hert's; of Messrs. MONTAGU SCOTT AND BAKER, Solicitors, 10, Gray's Inn Square, W.C., and Hatfield; and of the Auctioneers, 67 and 68, Cheapside, London, E.C., and Leytonstone, E.

## Bulbs from Holland.

Sales every MONDAY, WEDNESDAY, and SATURDAY, in the Large and Small Lots and Small Lots.

**MR. J. C. STEVENS** will sell by AUCTION, at his Great Rooms, 38, King Street, Covent Garden, W.O., every MONDAY, WEDNESDAY, and SATURDAY, at half-past 12 o'clock precisely each day, first-class consignments of HYACINTHS, TULIPS, CROCUS, and other BULBS, arriving daily from well-known Farms in Holland.

On view morning of Sale, and Catalogues had.

## Wednesday and Saturday Next.

Pyramidal and Dwarf-trained FRUIT TREES; also several hundred choice named Standard and Dwarf ROSE TREES, from a well-known English grower.

**MR. J. C. STEVENS** will include the above in his SALES by AUCTION, at his Great Rooms, 38, King Street, Covent Garden, W.C., on WEDNESDAY and SATURDAY NEXT, November 14 and 15.

On view morning of Sale, and Catalogues had.

## Thursday Next.—(Sale No. 7795.)

5000 GRAND BULBS OF LILIAM AURATUM, just received from Japan in the finest possible condition.

**MR. J. C. STEVENS** will include the above in his SALES by AUCTION, at his Great Rooms, 38, King Street, Covent Garden, W.C., on THURSDAY NEXT, November 15.

On view morning of Sale, and Catalogues had.

## Thursday Next.—(Sale No. 7795.)

SPECIAL SALE OF ORCHIDS IN FLOWER AND BUD. **MR. J. C. STEVENS** will sell by AUCTION, at his Great Rooms, 38, King Street, Covent Garden, W.C., on THURSDAY NEXT, November 15, at half-past 12 o'clock precisely, a fine COLLECTION of ORCHIDS in Flower and Bud, comprising many choice species and rare varieties.

On view morning of Sale, and Catalogues had.

## Cheap Bulb Sales.

**MESSRS. SMALL AND CO.** will sell by AUCTION, at 123, Fenchurch Street, City, E.C., every MONDAY, WEDNESDAY, and FRIDAY, at 12 o'clock each day, large consignments of GLADIOLI, SEILAE, DELLYLAE, DUTCH BULBS, &c., lotted to suit the buyer. Horticultural Auction Rooms, 123, Fenchurch Street, E.C.

## The Hewlett Road Nursery, Cheltenham.

TO GENTLEMEN, PLANTERS, NURSERYMEN, and OTHERS.

**MESSRS. ENGALL, SANDERS AND CO.** are instructed by the Executors of the late Mr. W. Hopwood, to SELL by AUCTION, at their No. 2 Nursery, situate above, on THURSDAY, November 15, 1888, commencing at 11 o'clock prompt, a quantity of well-grown NURSERY STOCK,

comprising the contents of 3 plots of land, which include a quantity of choice Evergreen and Flowering Shrubs; also a bed of about 1000 strong English Vines, 20,000 Evergreen Privet, Tree Box, healthy Laurels, a bed of extra large oval-leaved Laurels, also about 1000 American Arborvitae, Cupressus Lawsonii, strong Spruce Firs for Christmas Trees, Ivy in pots, Standard Ornamental Trees, dwarf and standard Roses, strong standard Fruit Trees, including Apple, Pear, Damson and Plum, Gooseberry and Currant Trees, and a quantity of other useful Nursery Stock.

The Lots may be viewed 3 days prior to sale on application at the Nursery, or at the Office, 85, High Street.

The Auctioneers beg to call special attention to this sale, as it affords an unusual opportunity to persons in want of stock. The whole of the lots are well-grown, strong and healthy.

Particulars and Conditions of Sale may be had on application to Mr. HOPWOOD, at the Belle Vue Nursery, 58, High Street; or from the Auctioneers, No. 1, Promenade, Cheltenham.

## Coombe Bank, Sundridge, Sevenoaks.

IMPORTANT SALE OF VALUABLE HOTHOUSE and other PLANTS.

**MR. JOHN WHITE** is instructed by W. H. Spottiswoode, Esq. (the Manchester and Cheltenham Grounds have been let for a term) to SELL by AUCTION, on the Premises as above, on FRIDAY, November 23, 1888, at 12 o'clock precisely, the whole of the CONTENTS of the HOTHOUSES, VINERIES, FRUITING FITS, FRAMES, &c., comprising choice Specimen Plants, Azaleas, Palms, Camellias, Rhododendrons, Alocas, Cacti, Orchids, Ferns, Begonias, Pelargoniums, Chrysanthemums, Bedding Geraniums, and other plants, Fuchsias, Primulas, Straw-plants, &c. May be viewed on the day prior to and morning of Sale; and Catalogues may be had at the Inns in the neighbourhood, and of the Auctioneer, 53, London Road, Sevenoaks.

## WANTED TO RENT, a small FLORIST

OR MARKET GARDEN BUSINESS, with Glass, Dwelling-house, and a few acres of Land.—W. B. C., *Gardeners' Chronicle* Office, 41, Wellington Street, Strand, W.C.

## Headingley Nurseries, Leeds.

**SALE by PRIVATE CONTRACT**, one of the most valuable NURSERIES in the district, as a going concern, by order of the Executors of the late Samuel Hartley. The Nursery contains an area of 8 acres, and is well stocked with a general assortment of Nursery Stock, also the Greenhouses, with well grown Greenhouse and Store Plants. The overall stock of the Nursery, including the House, Land, and Out-buildings. Application to be made to Mr. W. F. FEARNLEY, 16, Chapel Lane, Headingley, Leeds.

## The Hornsey Nursery.

# THOMAS GREEN & SON, LIMITED.

SMITHFIELD IRONWORKS, LEEDS, AND SURREY WORKS, BLACKFRIARS ROAD, LONDON, S.E.,

HORTICULTURAL ENGINEERS to HER MAJESTY THE QUEEN, call Special Attention to their Patent Wrought-Iron Municipal or Angular Chambered and Tubular

## HOT-WATER BOILERS,

And others with SHELVES, and Hollow or Ordinary Cast-iron GRATE BARS.

**SADDLE BOILERS.** With WATERWAY BACKS and WELDED BOILERS, any of which are specially adapted for Heating Greenhouses, Conservatories, Churches, Chapels

Schools, Public Buildings, Entrance Halls, Warehouses, Workshops, &c. They are the neatest, cheapest, most effective, and durable of any extant.

The MUNICIPAL and TUBULAR ones are remarkable for their great heating power, slow combustion, and the length of time the fire will burn without requiring attention.

These Patterns secured the FIRST and HIGHEST PRIZE—a SILVER MEDAL—at the Royal Horticultural Society's Exhibition, South Kensington, London June 1 1881.

### The Best Boiler Extant.

— FRONT ELEVATION —

— LONGITUDINAL SECTION —

SECTIONAL PLAN

The longitudinal section gives a view of the fire-box, water space, flues, &c.

The front elevation shows it set in brickwork, which is necessary for this class of boiler.

The cross section gives a view of the fire-box, water space and V-shaped back.

### TESTIMONIALS.

Messrs. THOS. GREEN AND SON, LTD., NORTH STREET, LEEDS.

Re HEATING APPARATUS.

Borough Engineer's Office, Municipal Buildings, Leeds, January 9, 1888.

GENTLEMEN,—I have great pleasure in bearing testimony to the efficiency and satisfactory working of the Hot-water Heating Apparatus you erected in these public buildings. The buildings are four storeys high, and we have a total length of about 23,000 feet of piping in them, varying in size from 1½ in. to 6 in. diameter, with their connections, &c. The several offices and rooms can all be in operation at one time or separately, and the heat regulated by means of the valves to the temperature required, even in the coldest weather.

Two of your Patent Municipal Pattern Boilers, No. 4, work the whole of this piping easily, although we have three of them fixed. They are very powerful and economical in the consumption of fuel, and I am pleased to be able to report of them and the apparatus so favourably.

I am, Gentlemen, yours truly, THOS. HEWSON, Borough Engineer.

GENTLEMEN,—The large Municipal Boiler which you sent me last year is doing its work satisfactorily; it is heating 5,000 feet of 4-inch pipe in one of my vineries, and I am quite sure that it has power to work a much greater length, while in cost of fuel it compares favourably with my other Boilers.

I have now five of your Boilers in use, and I cannot speak too well of their heating powers, or their comparatively small consumption of fuel.

Messrs. THOS. GREEN AND SON, LTD., LEEDS. Yours faithfully, (Signed) G. W. BASHFORD.

AND HUNDREDS OF OTHER REFERENCES CAN BE GIVEN IF REQUIRED.

## THE GARDENERS' CHRONICLE FORM OF SUBSCRIPTION.

FROM \_\_\_\_\_

To  
W. RICHARDS,  
41, WELLINGTON STREET, STRAND,  
LONDON, W.C.

1888.

Please send me "THE GARDENERS' CHRONICLE" for \_\_\_\_\_ Months, commencing \_\_\_\_\_, for which I enclose P.O.O. \_\_\_\_\_.

Please Note that all Copies Sent Direct from this Office must be paid for in advance.

THE UNITED KINGDOM:—12 Months, 15s.; 6 Months, 7s. 6d.; 3 Months, 3s. 9d.; Post-free.  
FOREIGN SUBSCRIPTIONS (excepting India and China):—Including Postage, 17s. 6d. for Twelve Months. India and China, 19s. 6d.  
Receipts for less than six months' subscription will not be sent unless specially asked for.

P.O.O. to be made payable at the Post Office, No. 42, DRURY LANE, London, to W. RICHARDS.

Cheques should be crossed "DRUMMOND."

G. O.  
Nov. 10, 1888.

# BULBS

FOR OUT & INDOOR CULTURE.

Large Collections of all the very Best Varieties of  
HYACINTHS, TULIPS, GROCUSES,  
NARCISSI, LILIES, SNOWDROPS, &c.

Only the very best kept in stock.

Prices extremely moderate.

## CHRYSANTHEMUMS

To Denmark and Australia.

WE HAVE THE LARGEST AND MOST  
COMPLETE COLLECTION in existence of all the  
newest and oldest Varieties in cultivation; and perhaps we  
are the only Firm who grow expressly for Amateurs so as to  
enable them to be successful. All are clean, strong, healthy,  
country grown (so very different to those from smoky towns),  
and give unbounded satisfaction to wherever sent.

Our continuous bank of Flowers, 1300 feet long, consisting  
of 275 new and 1025 old varieties, is one of the most interesting  
sights in England. 10,000 strong established plants (warranted  
true to name) now ready for all parts of the globe. Send for  
ours—the best Descriptive and Illustrated CATALOGUE.

Mr. P. E. T. BORREGAARD, *Aarhus, Denmark*, November 1,  
1888.—"The Chrysanthemums we had from you are turning  
out first-rate; and our friends as well as ourselves are looking  
forward for what is to come next."

Mr. W. F. McLANE, *Ross Street, Poora, Melbourne,*  
*Australia*, September 6, 1888.—"The Chrysanthemums came  
safe to hand, and are all breaking nicely."

**H. CANNELL & SONS,**  
SWANLEY, KENT.

## FENCES—MYROBALAN, CHERRY PLUM

(FRUNUS MYROBALANA)  
is the best stuff for mending old fences or making new ones.  
Grows well on poorest soils. Shoots very hard and spiny.  
Prices range from 12s. per 1000 to 10s. per 100. Full particu-  
lars on application to **EWING & CO., Havant, Hampshire.**

NEW

AND MOST

LOVELY

SHIRLEY

POPPY.

## STRAWBERRIES.

Strong Roots, 4s. per 100. Plants in small pots, 18s. per 100;  
ditto in large pots, per 100. Descriptive LIST free.  
**RICHARD SMITH AND CO., Nurserymen and Seed Mer-**  
**chants, Worcester.**

## RHODODENDRONS.

An immense Stock. 200 Named Sorts, from 1 foot to 5 feet  
high, including many varieties of our own raising, in addition  
to the best varieties of other raisers.

## AZALEAS.

Many thousands of Azalea mollis and other choice varieties,  
well-budded plants.

Silver-variegated, Hodgins' and other Hollies.  
Of these we have a surplus stock, and can offer them at low prices.

Priced Descriptive CATALOGUE of the above and General  
NURSERY STOCK free on application.

**ISAAC DAVIES & SON, Nurserymen, ORMSKIRK.**

Catalogues, on application to

JOHN CRAWSTON & CO.

# HELLEBORUS NIGER.

I can offer a magnificent lot of Christmas Roses, probably  
the finest lot in the Trade, especially of the H. niger major var-  
iety, which is the great favourite among market growers. These  
now offered are home-grown clumps full of flower-buds, and  
will be ready to lift in October; and I would advise early orders  
to secure them, as the stock of fine clumps is very limited.

**MAXIMUS.**  
A robust variety, the largest of the group, and very orna-  
mental as a foliage plant. It flowers in October and November,  
the blossoms are large and white, shaded with rose on the  
exterior, and generally produced in twos, but if shaded in a  
glass placed over the plants, the flowers are then pure white.  
By shading the flowers can be retarded even to December. It is  
the most vigorous of the group, and succeeds where many of the  
others fail to grow.

**THE MAJOR.**  
Although this plant is frequently offered, it is seldom to be  
obtained true to name, owing to its great value for cutting  
purposes. The flowers are pure white under glass, but have a  
slight rosy tinge in the open; it is the greatest favourite among  
market growers, producing flowers from December to January.

**RUBRA.**  
One of the most distinct and novel of this group. The flowers  
are large, produced about the end of January, and of a lovely  
colour. It is a robust grower, free blooming, and a decided  
acquisition for cutting.

**CAUCASICUS.**  
A really serviceable variety, producing large, conspicuous  
flowers, pure white, under glass. One of the most vigorous of  
all the Christmas Roses, and one which will succeed in almost  
any soil or position, flowering freely in the open ground in  
January. Home-grown Clumps, 1s., 1s. 6d., and 2s. 6d. each.

**MADAME FOURCADE**  
is a Gem, mainly one of the best flowers of medium size; snow  
white, and produced in the greatest possible profusion, even the  
very smallest possible flowering; of a good strong vigorous habit.  
Fine strong Clumps for forcing, 1s. 6d. and 2s. 6d. each.

**COLLECTED PLANTS.**  
These are far superior to the ordinary stuff generally offered,  
which are usually dried up and half dead before received,  
being collected by inexperienced men; those now offered are  
fine healthy plants, and usually are as fresh as when first  
lifted, and always do well.

Prices on application.

# THOMAS S. WARE, HALE FARM NURSERIES, TOTTENHAM. BULBS.

A FEW REASONS FOR GETTING THEM FROM  
RICHARD SMITH & CO.:-

We have dealt in them for more than eighty years.  
We have visited the best Bulb Farms and have selected the  
best roots and the best varieties.

The Bulbs we have supplied have practically always given  
satisfaction, and our prices are moderate.

Illustrated descriptive List of Dutch and Home-grown Bulbs free.

# THE DOUGLAS FIR IN SCOT- LAND.

AMONGST the exotic timber trees which have  
been introduced into Europe during the  
present century, the Douglas Fir has attracted  
more notice than any other species, owing to its  
remarkably quick growth during early youth.  
Specimens growing in free positions are believed  
to have laid on a mean annual increment of as  
much as 3 cubic feet, while only 1 cubic foot, at  
the outside, could be expected of a Larch tree, and  
even in a few fully stocked woods the increment  
appeared exceedingly great.

In the *Gardeners' Chronicle* of October 8,  
1887, p. 427, an extract from the *Perthshire  
Constitutional* was published, which drew atten-  
tion to the oldest pure wood of Douglas Fir,  
situated at Taymouth in Perthshire, on the estate  
of the Earl of Mansfield. The plantation in  
question is spoken of in glowing terms, but only  
a few scanty measurements are given, so that it is  
difficult for the reader to arrive at any definite  
idea on the progress of the plantation, whereby  
he can compare it with that of our indigenous  
timber trees. Besides being of very rapid growth,  
it has been claimed for the Douglas Fir that it is  
not liable to disease—an advantage, which, if it  
really did exist, would be of great weight.

Such general statements are often misleading,  
and I determined to take the first opportunity to  
inquire somewhat more fully into this matter.  
Accordingly during a short tour in Scotland in  
July last, I measured a sample plot in the Tay-  
mouth Douglas Fir plantation, and I also mea-  
sured, by way of comparison, a sample plot in an  
adjoining Scotch Pine plantation. The results  
of these measurements seem to me of sufficient  
interest to deserve publication.

The plantation of Taymouth is situated about  
7 miles to the north of Perth, in 56½° northern  
latitude, and at an elevation of about 200 feet  
above the level of the sea. The ground slopes  
very gently towards the south-east and the  
soil consists of so-called "stiff till," which in this  
case, may be described as a loamy clay, retaining

moisture well. The quality of the locality may safely be given as first or best quality for the growth of trees. The rainfall has been put down at 28 inches annually. The area of the plantation amounts to 8 acres, and this was planted by Mr. William McCorquodale, the senior wood manager in Scotland, in the spring of 1880, in the following manner:—Douglas Fir, four years old, 9 by 9 feet; Larch, four years old, one between every two Douglas Firs, and an additional line between every two lines of Fir, so that the plants stood  $4\frac{1}{2}$  by  $4\frac{1}{2}$  feet, each acre containing 2151 plants, of which 538 were Douglas Fir, and 1613 Larch. The plants of Douglas Fir were two years' seedlings, and two years' transplanted. The plantation took a good start, and the Firs are said to have taken the lead at once. The Larch were gradually thinned out, until the last disappeared before the year 1880, since which time the plantation was one of pure Douglas Fir. The first regular thinning of the Douglas Fir occurred in 1887. Before that thinning, about 277 trees remained per acre, the remaining 261 having gradually disappeared during the previous twenty-seven years. Of the 277 trees seventy-five per acre were thinned out in 1887, so that now, in 1888, the countings showed 202 trees per acre.

No accurate statistics are in my possession regarding the material removed by thinning up to date. At the present moment the area is well stocked, and any small interruption of the leaf canopy by the thinning of 1887 will disappear by the end of 1889, when the cover overhead will, barring accidents, be again perfect. Thus, the thinning of 1887, though fairly heavy, was by no means too heavy.

On a sample plot, measuring four-tenths of an acre of average appearance, all trees were carefully measured by myself personally on July 20, 1888, at height of chest, or 4 feet 6 inches from the ground; a selected sample tree was felled by the kind permission of Mr. McCorquodale, carefully measured, and thus the cubic contents or volume of the tree ascertained, separated according to solid wood and branches. The former includes all wood over 3 inches diameter at the small end. In the present case none of the branches measured as much as 3 inches in diameter, so that the solid wood represents the stem of the tree from the ground up to a diameter of 3 inches. The following table shows the growing stock per acre:—

Diameter of Tree at 4 feet 6 inches above the ground, in inches.	Number of Trees in each Diameter-Class.	Total Sectional Area at 4 feet 6 inches, in square feet.
4	3	26
5	12	164
6	8	59
7	7	187
8	10	349
9	17	751
10	15	818
11	23	2178
12	20	2356
13	35	3826
14	17	1817
15	20	2454
16	8	1117
17	2	315
Total ...	202	15817

From the above data it follows that the average sectional area per tree is  $= \frac{15817}{202} = 783$  square feet, which corresponds to a diameter of 12 inches.

The sample tree, of average development, which was felled, showed the following dimensions:—

Diameter at 4 feet 6 inches above the ground	11.75 inches.
Sectional area	787 sq. ft.
Height	60 feet.

At 48 feet from the ground the stem showed a diameter of 3 inches, and here the top was cut off. These 48 feet were divided into eight sections of 6 feet length each, each section measured in the middle, and thus the following data obtained:—

Number of Section.	Length of Section in Feet.	Mean Diameter of Section in Inches.	Volume of Solid Wood in each Section in Cubic Feet.
1	6	12.5	5.11
2	6	10.0	3.27
3	6	9.5	2.95
4	6	8.5	2.36
5	6	7.0	1.90
6	6	6.5	1.38
7	6	6.0	.82
8	6	3.5	.40
Total ...	48	...	17.89

The top, 12 feet in length, and the branches, were stacked, and found to fill a space of 50 cubic feet, which may perhaps be put as equal to  $50 \times 15 = 75$  cubic feet of woody matter. In the present paper this wood will not be taken into account.

From the contents of the sample tree, the volume of solid wood per acre was calculated according to the following equation:—Volume of sample tree: volume per acre = sectional area of sample tree: Sectional area of all trees per acre; or  $17.89 : x = 757 : 15817$ , and  $x =$  volume per acre  $= \frac{1789 \times 15817}{757} = 3738$  cubic feet of solid wood over 3 inches in diameter, exclusive of top and branches.

By dividing the volume by the age of the trees (32) the average annual production of wood is obtained:— $\frac{3738}{32} = 117$  cubic feet, exclusive of previous thinnings; or, if only the time since planting (28 years) is taken into account:—Average annual production of solid wood  $= \frac{3738}{28} = 133$  cubic feet, exclusive of previous thinnings.

By way of comparing these results with the production of one of our indigenous trees, I measured the trees on a sample plot of one-tenth of an acre—in a very uniform plantation of Scotch Pine, situated at a short distance from the Douglas Fir plantation. This Scotch Pine plantation had been established in a somewhat elevated spot, which was formerly of a swampy description. The locality must be classed as of second quality only, compared with the locality in which the Taymouth Douglas Firs grow. It was drained and planted in 1847—that is, forty-one years ago—with four years old plants of Scotch Pine; it has been thinned three times, and it will again be thinned in 1889. On July 20, 1888, the area was fully stocked. Omitting all suppressed trees, the survey yielded the following results:—

Diameter of Tree at 4 feet 6 inches above the ground in inches.	Number of Trees in each Diameter-class.	Sectional Area at 4 feet 6 inches in square feet.
5	40	545
6	70	1374
7	70	1871
8	90	3142
9	100	4418
10	70	3818
11	40	2640
12	10	785
Total ...	490	18593

It will be noticed that this plantation shows a

greater sectional area per acre than the Douglas Fir plantation.

The mean height of the wood was found to be 45 feet, and from the available data it was ascertained that the volume of solid wood (3 inches diameter and upwards) amounted to 5015 cubic feet per acre. By dividing this number by 45—the total age of the trees, I obtained:—Average annual production of solid wood  $= \frac{5015}{45} = 111$  cubic feet, exclusive of previous thinnings; or, if only the time since planting is taken into account:—Average annual production of solid wood  $= \frac{5015}{41} = 122$  cubic feet.

If now we compare the average annual production of Douglas Fir and Scotch Pine, we find—Douglas Fir = 117 resp. 133, against Scotch Pine = 111 resp. 122 cubic feet; here, then, is an almost inappreciable difference, especially if it is considered that the quality of the soil in the Scotch Pine wood is decidedly inferior to that of the soil in the Douglas Fir wood. Unfortunately I had no opportunity of measuring a Larch wood in the vicinity of Taymouth, but it is well known to all foresters that, up to an age of forty-five years, at any rate, Larch produces a greater volume than Scotch Pine, so that I may safely say:—“If grown in a well stocked or crowded wood and in localities of equal quality, Douglas Fir is not likely to produce more solid wood during the first thirty or forty years than the Larch, and probably also not more than Scotch Pine.”

The explanation is, that, although the individual Douglas Fir develops more rapidly in diameter and in height than a Scotch Pine or Larch, it requires, at any rate in Scotland, much more space; and consequently an acre of land will hold only a much smaller number of trees. Moreover, I shall further on show that it is more tapering than the important European Conifers.

On the other hand, the growing stock of a Douglas Fir wood consists of much larger trees (though smaller in number) than an equally old Larch or Scotch Pine wood, and this is a great advantage where big timber fetches higher prices than moderate-sized timber. This advantage will, however, to a considerable extent, disappear with advancing age, when our indigenous timber trees reach the size usually demanded in the market. *W. Schlich, Cooper's Hill.*

(To be continued.)

## NEW OR NOTEWORTHY PLANTS.

### CYPRIPEDIUM ELLIOTTIANUM, n. sp.

This species [to which reference was made by Mr. O'Brien last week], is the nearest ally of *Cypridium Rothschildianum*. Its leaves are broader, apparently stiffer. The spikes at hand are two-flowered. Mr. G. Godseff, however, has seen them with five flowers. The primary peduncle appears to be much stronger than in the species named; it is reddish, covered with very short hairs. The fine bracts are those of *Cypridium Rothschildianum*, but white with dark red-purple longitudinal stripes. Ovaries white with red ribs. Both sepals white with dark red longitudinal stripes. Petals longer by one-third, with dense, short, blackish cilia, undulate at the base, white, with numerous Indian-purple stripes and freckles, except at the apex. The shape of the lip is like that of *Cypridium Stonei*, colour reddish-brown. Staminate angulate, both shanks ultimately contiguous, markedly bifid at the apex, hairy.

The best mark of distinction is the sharp bifid apical part of the staminate. I have the impression that the colours are much richer, the flowers larger, and the peduncle stronger, the leaves broader and stiffer.

This exceedingly elegant and surprising species is dedicated to Mr. Elliott, of the firm of Messrs. Young & Elliott of New York, at the suggestion of Mr. G. Godseff, who knows Mr. Sander's wishes. What a success for the firm to have imported in so short

time *Cypripedium Sanderianum*, C. Rothschildianum, and C. Elliottianum! *H. G. Rehb. f.*

*CATTLEYA LABIATA* WARSCWICZII ROCHELLENSIS, *n. var.*; or, shorter, *CATTLEYA ROCHELLENSIS*.

When my good friend, the late Joseph von Warszewicz, returned from his second voyage to tropical America in November, 1853, he told me his best plant was a new *Cattleya*, bearing 5–10 flowers on one raceme, with very tall bulbs. I have in my herbarium my friend's original treasure. He complains of the impossibility of doing justice to the colours, alluding to the poorness of his colour-box. The plant was discovered in the province of Medellín, at the height of 6000–8000 feet. My forty-seven typical flowers are so well preserved that they even now show the superior disc of the lip to have a broad yellow area. The specimen introduced into the trade latterly by Director Lindner, gathered by the late Benito Roelz, is, in my opinion, a sub-variety of this, having two distinct spots on the disc in lieu of the confluent ones.

My friend, Joseph von Warszewicz, declared *Cattleyas* to be the greatest treasures of his razias. During the first journey he discovered *Cattleya Dovi-ana* (his *Cattleya Lawrenceana*, dedicated to his well-wisher, Mrs. Lawrence, of Ealing), and on his second journey *Cattleya Warszewiczii*. We cannot understand now-a-days, how it was possible that his imported *Cattleyas* did not flower. As to *Cattleya Lawrenceana*, I saw small plants at Berlin. Mr. Mathieu and Mr. Naner (then having his excellent head gardener, M. Gireoud, now of Sagon), had little pieces which, by the way, died after six or ten years. As to *Cattleya Warszewiczii*, I never heard of a living plant imported by J. de Warszewicz: hence I suppose it was lost in the Magdalena River, with so many other fine plants, the steamer having been wrecked. And now I have before me a glorious specimen from Messrs. Liebrecht & Wadley, florists and nurserymen, 409, Fifth Avenue, Rose Hill Nurseries, New Rochelle, New York, through the hands of my countryman, Professor Demcey, of Hoboken, who is so enthusiastic in spreading the love for natural history in the United States. It resembles *Cattleya Warszewiczii*, as there is a light yellow confluent hue (not two eyes) on the upper part of the disc. There is also an exceedingly light, evanescent purplish hue on the anterior disc of the lip; with these exceptions all the flower before me is snow-white. This beautiful plant attracted the admiration of all the specialists; but it disappeared from the botanical world to make a fresh *début* in the celebrated collection of Mr. Frederick L. Ames, of North Easton, Massachusetts, where Mr. Joseph Godseff, of the Sanderian firm, was so fortunate as to see it in full flower. It is to be hoped that the stock of *Cattleya Warszewiczii* of Messrs. Liebrecht & Wadley may contain more such 'vestal beauties, though from a remark in one of their letters, I conclude they are not very hopeful as to this; all the better, then, for Mr. Frederick Ames, as, most probably, no collector is free from the worthy ambition of possessing some unique treasure—and this is one! *H. G. Rehb. f.*

*LÆLIA EUTERPE* ×, *n. hybr.*

This is a new and very beautiful hybrid, raised by Mr. Seden, and which has just flowered in the establishment of Messrs. Veitch & Sons, Chelsea, from whom I received it. It was raised from *Lælia pumila* Dayana, fertilised with the pollen of *L. crispata*, the seed having been sown in 1881. The following note has been supplied to me by Mr. Kent as to the present strength of the plant:—"Six somewhat slender stems, 2–4 inches long, monophyllous. Leaves leathery, rigid, narrow, oblong-ovate, 6–7 inches long." The flower measures 3½ inches in expanse, the sepals narrowly lanceolate, acute; petals twice as broad, and more obtuse, somewhat crisped; all the segments of a bright rose-lilac. Lip somewhat three-lobed, the front lobe beautifully crisped, crimson-purple, with a little white variegation, and the veins of a deeper colour than the rest, giving a brilliant effect. The side-

lobes are also deep crimson-purple at their apex, while a band of the same colour extends down the centre of the lip to the base, the rest of the lip being white, with light yellow veins. The front of the column below the stigma is crimson-purple, but the remainder of the column white. The pollen masses are eight in number, and quite equal, as would be expected from both the parents being typical *Lælias*. It is a beautiful addition to the autumn-flowering group, the very decided colouring of the lip forming a decided contrast with the lighter-coloured sepals and petals. *R. A. Rolfe.*

*DENDROPHYLAX FAWCETTII*, Rolfe, *n. sp.*

This remarkable and not less beautiful Orchid is now flowering in the Kew collection, and for the first time. Imagine a tuft of roots, long, flexuose, cylindrical, and greenish in colour, spreading in all directions from a very short tuft-like caudex, no leaves whatever, flowers 2 inches in diameter, the large bilobed lip pure white, the lanceolate acute segments of a most delicate greenish-white, and a slender pendulous spur 7 inches long, and you have the new plant; almost a counterpart of *D. funalis*, Benth. (the old *Angraecum funale*, Lindl., *Bot. Mag.*, t. 4295), except some slight differences, and the

FIG. 74.—*BEGONIA DAVISII*.

gigantic spur, three times at least as long. It was found by Mr. W. Fawcett, F.L.S., Director of the Jamaica Botanic Garden, in the Cayman Islands, West Indies, during his recent trip to investigate the disease which is destroying the Cocoa-nut Palm there. Both living and dried specimens were transmitted to Kew during the past summer. Notwithstanding its leafless condition—for the green roots do the work of assimilating nutriment—the plant has thoroughly established itself on a block, and young roots are pushing in all directions. The peduncle is but 2 inches long on this plant, but on a dried one sent home is at least 23 inches, or over ten times as long. It is hardly necessary to say that the plant is dedicated to its discoverer, with the hope that if other such novelties should be lurking in the West Indies, he will let us hear of them. Respecting this small genus there are, beside our novelty, *D. hymenantha*, Rehb. f., the 'original species, a native of Cuba, with flowers, including the spur, but half an inch long; *D. Lindenii*, Benth., with spur nearly as long as in our present species, but remarkably attenuated, acute lobes to the lip, a native of Cuba and Florida, in the latter locality said to grow on the stem of the Royal Palm; *D. Sallei*, Benth., a native of San Domingo; and *D. funalis*, Benth., a native of Jamaica. This latter rejoices in the following *aliases*—quite sufficient in

all conscience—*Limodorum funale*, Sw.; *Epidendrum funale*, Sw.; *Cecocladus funalis*, Lindl.; *Trichocentrum funale*, Lindl.; and *Aeranthus funalis*, Rehb. f. *R. A. Rolfe.*

## TUBEROUS BEGONIAS.\*

There are a good many florists' flowers cultivated in our gardens of which we do not know the origin. We may know the wild species or be able to give more or less exact "guesses at truth" in the matter, but, the exact method pursued by the earliest growers is, but too often, lost in the obscurity of the past. This is more or less true of some of the most popular garden flowers of to-day. The Tulip, the Auricula, the races of double Primroses, the Pink, the Carnation, the double, or Turban Ranunculus, and even double Pæonies, and double Roses, seem like Topsy, to "have grown up" into the horticultural horizon, and no one can say to-day how, why or wherefore they sprang into existence. As we have said we can put our fingers pretty correctly on their wild prototypes in some cases, but, even the wisest of us could not stand a very severe cross-examination as to when, where, and why the developments we now admire came into existence. Even among fruits, and vegetables we have in many cases quite lost sight of the original species or prototype, and the common Union, the most cosmopolitan of all vegetables, may be cited as a case in point. Again as, in some sort analogous to the seemingly accidental or spontaneous cropping up of double flowers, we have those fruits which, like the Zante or Corinth Grape, the Sultana Raisin Grape, the Banana, and in a lesser degree the Pine-apple, and the Mangosteen are most often seedless, and so are and have for many centuries been propagated by vegetative methods, *i.e.*, by cuttings, suckers, or other methods of division rather than by seeds.

Nowadays, thanks to a more awakened interest and to improved facilities for recording newly accomplished facts, there are some flowers in our gardens, the origin of which is tolerably well known. The hybrid *Nepenthes* and Orchids, and the greenhouse *Rhododendrons* of Veitch stand out clear and definite in this connection. The florists' Pansy slipped into existence years ago in a surreptitious sort of way, and the history of its more modern race or offshoot—the tufted or bedding *Viola*—might be a great deal clearer than it really is; but it is quite a relief to think of one of the latest of all the gardener's creations, *viz.*, the tuberous *Begonia*, since we can confidently trace its origin and development during the past twenty years or more, that is, from the introduction of *B. boliviensis*, B. Pearcei, B. Veitchii, and one or two other wild species of South America, until we come down to the most recent seedling varieties of Laing and Cannell, or of Lemoine and Crousse. In a word, the tuberous *Begonias* must be numbered amongst the most remarkable products of our time, so beautiful, so variable in form, and in colour, so easily raised from seeds, and so readily to be grown to perfection without much if any artificial heat, that we do not wonder that nurserymen and amateurs alike have made a specialty of such a bright and pleasing race of florist's flowers, nor can we wonder that the proprietors of the *Gardening World* should have so promptly and so well fulfilled a public want in publishing the neat and reliable handbook now before us entitled *The Tuberous Begonia, its History and Cultivation*—a book that is likely to lend an impetus to the more extended and better cultivation of the flowers, of which it treats in detail and at considerable length. As well pointed out in its pages, these flowers possess a twofold chord of interest for amateurs, and for practical purposes may be divided into two sections, *viz.*, those best adapted for greenhouse or con-

\* *The Tuberous Begonia, its History and Cultivation*, Illustrated. Edited by B. Wynne, F.R.H.S. London: Gardening World Office, 17, Catherine Street, Strand, W.C. Pp. 104 and Index. Price 1s.

servatory culture in pots, and those of bushy and floriferous habit, which lend themselves perfectly to various phases of open-air culture as planted out in beds and borders.

The work really begins with a well written introductory chapter, followed by one containing a brief sketch of the order or family to which these plants naturally belong, in which, however, we find no reference to the investigation of the nature of the tuber by M. Duchartre, nor to the monograph of the late M. Fournier in the *Journal of the National Horticultural Society of France*, and which contains much the fullest and best account of the botany of the subject. The history and morphology of the plants was also treated at length in these columns, with illustrations, on August 26, 1882. The history of the tuberous Begonia is sketched, and chapters provided dealing with propagation from seed or cuttings, cultivation in pots; on double-flowered kinds, and on Begonias for exhibition and for late autumnal flowering. The chapter on the new race of winter flowering Begonias will be read with interest, and as being both suggestive and prophetic of better things to come. Then we have a dissertation on Begonias for beds during the summer season, and valuable chapters on hybridisation and seed saving; the best form of Begonia-house, and, finally, a select list or catalogue of the very finest varieties at present in cultivation, both single and double-flowered.

The book is tolerably well illustrated with woodcuts of some of the species and varieties described, and there are good portraits of Mr. Laing, Mr. Cannell, and last, but by no means least, one of the late Mr. Richard Pearce, the Veitchian traveller and collector in Bolivia and Peru, to whose courage and ability the introduction of most of the original types was due, and whose name will be ever green in the memory of all who grow such other of his introductions *Lapageria alba*, *Hippeastrum Leopoldi*, and *H. pardinum*. The sudden death of Mr. Pearce was a loss to British horticulture, and one more addition to that army of martyrs to science and duty, who have sprung from the ranks of the gardening fraternity. It is most interesting to know that all these varieties of hybrid and cross-bred Begonias, now so numerous, so varied and so beautiful, are the descendants of six wild species, all introduced in the following order from Peru and Bolivia, where they grow at a considerable elevation above the sea.

1. *B. boliviensis* was the first of the whole group discovered by the late Richard Pearce in Bolivia, and sent to Chelsea by him in 1864. In 1867 it was figured and described in the *Botanical Magazine*, t. 5657, as "a tuberous-rooted deciduous kind, attaining an average height of 2 feet." Its stems were fleshy, but rather slender; the leaves rather small and deflected, with serrate margins, and its vermilion-red flowers were pendulous from the axils of the ascending stem. Our illustration (fig. 75, p. 536), shows the natural size of leaf and flowers. Curiously enough the plant seems to have disappeared from cultivation.

2. *B. Pearcei* was introduced in 1865, having previously been collected at La Paz in Bolivia by its discoverer, after whom it is most appropriately named. It is a plant of dwarf habit, having dark blotched leaves of a rich velvet-like green tint, and pure yellow flowers about an inch or more across. It is figured in the *Botanical Magazine*, t. 5545, and its marked characters of leafage and colour of flower are as a rule very easily detected in its progeny of to-day.

3. *B. Veitchii*, a bold and distinct plant, also found by Mr. Pearce, was introduced in 1867, and it was figured in the *Botanical Magazine*, t. 5663, where its habit is said to be that of "Saxifraga ciliata, and immense flowers of a vivid cinnabar-red that no colourist can produce." This plant was found growing near Cuzco in Peru, at an elevation of 12,500 feet. It is a bold and effective plant, even in its original state, being moreover quite hardy in many localities in England and Ireland, and although now surpassed by some of its seminal descendants one can

never forget that it is to this species that most of their superior qualities are due. Our illustration (fig. 76, p. 536), shows a male and a female flowers of *B. Veitch* of the natural size.

4. *B. roseiflora*.—Another Andean species, found at an altitude of 12,000 feet, introduced by Messrs. Veitch to Chelsea, where it bloomed in 1867. It has orbicular fleshy leaves, similar to those of *B. Veitchii*, and two to three-flowered scapes of pale rose flowers about 2 inches in diameter. It has been for far less moment than its ally, *B. Veitchii*, as a parent, but to its paler flowered varieties we are indebted for the Queen of Whites of 1878, and for *rosea superba*, a variety sent out in 1880. *B. roseiflora* is figured in the *Botanical Magazine*, t. 5680.

5. *B. Davisii* (fig. 74).—Another remarkable Veitchian introduction from Peru discovered by Mr. Walter Davis, near Chupe, at an elevation of 10,000 feet. It first flowered at Chelsea in 1870, and was distributed in 1879. This is a distinct species of dwarf and compact habit, its leaves being tufted, and from among them its erect scapes rise to a height of 6 to 9 inches, each bearing three flowers of a brilliant orange-scarlet colour. By crossing the progeny of *B. Veitchii* and *B. boliviensis* with *B. Davisii*, some remarkably brilliant tinted forms have been derived of both the single and the double blossomed types. *B. Davisii* is figured in the *Botanical Magazine*, at t. 6232.

6. *B. Clarkei*.—This plant somewhat resembles *B. Veitchii*, and, like it, is supposed to have come from Peru, but it is very much less hardy—a fact which suggests the possibility of its naturally growing at a lower altitude. It first flowered with Colonel Trevor Clarke, at Welton Place, Darenty, he having previously received it from Messrs. E. G. Henderson & Sons. Growing 2 feet in height, it bears flowers of a bright rose-red colour 2 inches or more in diameter, and its leaves are 6 or 8 inches across, and of a dull green colour. Like *B. roseiflora* it has been but very slightly employed by the hybridisers. It is figured in the *Botanical Magazine*, t. 5675. There are two other species, both with great potentialities as winter bloomers, viz., *B. Probellii* and *B. scottrana*, and as such deserving of notice. Messrs. Veitch have a series of hybrids from *B. Probellii*, whilst Mr. John Heal has succeeded in rearing a variety of considerable merit which bears his name, by crossing the female flowers of *B. scottrana* (a species introduced from Socotra by Professor Balfour), see fig. 77, with the pollen of a hybrid named Viscountess Doneraile. This (John Heal) is one of the most remarkable of all the hybrids produced since Mr. Seden raised the original hybrid *B. Sedeni* in 1869 or 1870. Viscountess Doneraile was raised between *B. Monarch* (= *B. Sedeni* × *B. intermedia*) and *B. Sedeni* (= *B. boliviensis* × species?) so that John Heal contains within itself the characteristic of *B. scottrana* (section *Augusta*), *B. Sedeni* (section *Barya*), and *Monarch* (section *Huszia*). It is a dwarf habit plant, and botanically interesting as its paniculate inflorescence produces rose crimson male flowers only. Since John Heal was raised Messrs. Veitch have brought forward two other hybrids, viz., *Adonis* with rose-coloured flowers, and *Winter Gem*, and as these begin blooming in October and November, and continue during a great part of the winter it is now possible to enjoy the flowers of one or other of the sections of the tuberous Begonia all the year round.

One might say much more as to the peculiar merits, and especially as to the botanical peculiarities of these flowers, as developed by their prime introducers, Messrs. Veitch, and by such noted raisers as Messrs. Laing and Cannell, but for the present we must refer our readers to the book itself, as the most complete and reliable epitome of all that is practically known to-day of the now popular tuberous-rooted section of the genus *Begonia*.

MELONS.—Alphonse Karr owns to a weakness for Melons, but has not yet experienced the fate of Pope Paul, who died one morning after having eaten two large Melons for supper the night before. The Emperor Albert of Austria in 1459, according to the same authority, died from eating too freely of Melon.

## ORCHID NOTES AND GLEANINGS.

### ORCHIDS AT GHYLLBANK, ST. HELENS.

WHETHER the ecclesiastical looking edifice devoted to the manufacture of Beecham's pills has a benign influence on and acts as an antidote to the poison ejected into the air of St. Helens from hundreds of tall chimneys of copper, glass, and other factories which abound in the neighbourhood is not yet proved, but certain it is that the collection of Orchids which W. J. Thomson, Esq., has got together in that smoke-laden district does not seem in the least to resent the unpleasant state of things in the atmosphere around them. Assiduous care on the part of the enthusiastic owner and his careful gardener may have doubtless much to do with the good condition of the plants, but still no more pointed instance could be found anywhere of the adaptability of these plants for growing in unwholesome surroundings, such as are found at St. Helens. Good showy things are appreciated at Ghyllbank, and in its houses handsome representatives of the showy *Cattleyas*, *Lælias*, *Odontoglossums*, &c., are to be found, but here also find a home a large number of interesting things, such as *Cirrhopetalums*, *Sarcanthus*, *Epidendrum*, and others usually denominated botanical curiosities, but which somehow or other never fail to attract a large amount of attention when in bloom. A glance at the plants now in bloom will serve as a sample of the constantly changing display to be found here. We may notice, first, a giant plant of the graceful *Cymbidium elegans*, with ten flower-spikes; then a *C. Lowianum* to match, sending up its spikes beside it; beside these were some pans of *Pleione lagaria* and *P. maculata*, with over fifty expanded flowers on each; some fine *Lælia prastans*, a magnificent Swan Orchid (*Cynoches chlorochilon*), the pretty *Catastium roseo-album*, and overhead the pretty *Ionopsis utricularioides*, with its graceful sprays of lilac and white flowers; and the neat little *Leptotes bicolor*. Some rare and curious *Polytachyas*, too, were in bloom, some well flowered *Onoclea unguiculatum*, a noble example of *Odontoglossum Uro-Skinneri*, and the singular *Epidendrum umbellatum*, with its large greenish-white flowers and fleshy leaves arranged like a large green Nanodes.

The collection contains many rare *Angraecums*, and in the East Indian-house a plant of the handsome ivory-white *A. Chailluanum* had three fine sprays of ten flowers each; and the pretty *A. pestusum*, and the curious *A. ichneumonum* were in bloom. In the same house were *Phalenopsis Sanderiana*, *P. Lowi*, *P. cornu-cervi*, and *P. Schroderiana*, and a magnificently bloomed lot of *Eucharis amazzonica*, which arranged well with the Orchids.

The *Cattleyas* and *Lælias* are very stout, healthy, and well sheathed for bloom. Some nice plants of the pretty and fragrant *C. luteola* were in flower, and also good examples of *C. Eldorado*, a species which when grown well forms a handsome plant.

The *Odontoglossum*-house contained representatives of most of the good things called cold-house plants, and some were in bloom; while in flower in other houses were the true *Papilion grandis* with disproportionately large crimson and white flowers, considering the small size of the plant; *Vanda coccinea*, *Galeandra Baueri*, *Dendrobium sanguinolentum*, *Rastepia antennifera*, *Miltonia Moreliana*, *M. candida*, *Epidendrum vitellinum*, &c.

Among the collection of choice *Cypripediums* in flower were large plants of *C. Sedeni*, *C. S. candidulum*, *C. Spicerianum*, *C. Leeaeum*, *C. calarum*, *C. Argus*, *C. Pearcei*, &c.

In a district devoted almost solely to business, Ghyllbank and its Orchids make a bright spot, the pleasure of which can only be known to their genial owner and his friends.

CATTELEYA BOWRINGIANA.

This lovely Orchid will no doubt in the near future be extensively grown, flowering as it does when

Cattleya flowers are scarcest. Several plants of it have been in great beauty in our collection for the past three weeks; and among them are three distinct varieties, varying from light rose to a deep rose-purple, not unlike a good dark form of Cattleya Skinneri. It is a very free-flowering species, and we have at the present time as many as sixteen flowers on a spike. *Erin.*

#### LÆLIA ANCEPS.

"The range of *Lælia anceps* extends in the State of Vera Cruz on the Atlantic coast from Jalapa, its northern limit, to Orizaba southwards. It grows on the eastern side of the Cordilleras, and is most abundant in the neighbourhood of Cordova. Leaving these districts it is not found again until, in a southerly direction, the Pacific coast is reached. The original localities for this *Lælia* are on the Atlantic coast, and in those the typical form prevails. It is from the Pacific side that the numerous white varieties recently discovered and imported have come.

Generally this *Lælia* is found growing on trees on the outskirts of virgin forests, but occasionally on rocks fully exposed to sun and air. The plants cling to the rocks by means of their roots, and these are nourished by decayed moss and detritus. Wherever the plants grow fully exposed their bulbs and leaves assume a ruddy tinge, while those in partial shade are green, and do not flower so abundantly. The climate of this part of Mexico is peculiar. There is a distinct rainy season extending from May to October. During this period the plants are drenched daily with rains for several hours, and throughout the night are thoroughly saturated. Early in the morning a cold, drying wind blows and dries the plants, which afterwards are fully exposed to the fierce sun, until the daily storm drenches them afresh. After the rainy season has ceased (in November) the plants flower, and the new growths formed during the rainy season are fully developed, and become firm or ripened. Now the plants owing to the dryness, are at rest, but about the end of February the new bulbs begin to show signs of activity by sending out roots, and these are encouraged by the "short rainy season" which occurs about that time. But the rain then is only like fine mist, and does not saturate the plants; and this goes on until the return of the long rainy season. The new bulbs begin to form about March, and are well advanced before the heavy rains come. These are the main points in the observations gathered from collectors, and from them growers may glean hints as to the treatment of *Lælia anceps*, though, of course, due allowance must always be made for the artificial conditions under which Orchids are cultivated in Europe, and the wide difference in the power of a Mexican sun and clear atmosphere. It would be difficult to imitate closely the natural conditions, but the main principles of cultural treatment may be founded upon the climatic peculiarities of their native habitats." *Sander's "Reichenbachia."*

#### WALL FRUIT-TREE BORDERS.

THESE, when skirting the fruit-walls, are almost invariably made far too narrow. The object of a specially made border for our fruit trees is that it should be a better place for the growth of the trees, and the ripening of wood and fruit, than could be found in the unsheltered border away from the wall. For this purpose it should be made from 1½ to 2 feet higher next to the wall than the rest of the surrounding ground; this admits not only of an increase in the depth of soil, but it renders the border warmer, and if the drainage of the garden generally is good, such a border is also drier than the rest of the soil. I should always advocate the laying in of rubble drains, V-shaped at the bottom, at a depth from the surface of 4 feet, in lines 25 feet apart, running crosswise of the border, and emptying into a pipe-drain under the walk. The draining of fruit borders should not end with the south border, but should extend to all

aspects; the northern one especially should be well done, as here the evaporation is less than elsewhere, and this border, as a place for late Cherries, Plums and Pears, bush fruits, Strawberries, salads and other vegetables, renders it almost as important as the south border, but in a retarding in contradistinction to a hastening sense.

Where space allows of its being done, the whole of the fruit borders should measure from front to back 20 feet, and the south border might be advantageously of 36 feet, with a rise of 2 feet from the walk; and to give sufficient space to train the trees this wall should be built so much higher than the others. The space reserved for the trees on any border should not be less than 7 feet, and for Pear trees on the Pear stock it should be more than that. This part of the border should be level, not sloping, like the rest, otherwise, owing to the trampling of the soil in attending to the trees the rain would run off and the trees suffer from want of water at the root especially near the wall itself, thereby entailing much labour in watering if the trees are to be kept in health.

To prevent the encroachment of the cropped part of the border on the tree portion of it, it is always best to plant a line of Violets, alpine Strawberries, Hepaticas, Polyanthes, or any low-growing perennial plant. This line serves as a hint to the most ignorant gardener-labourer that digging ended there. All roots found outside of this fence should be cut off annually, for if allowed to get into the richly manured cropping ground, strong growth and its usual concomitant unfruitfulness are certain to result. The trampling of the soil of the fruit tree border above alluded to, which occasions a hard and usually an impervious crust, could be averted in great measure by placing a line of close trellis—say, 1½ foot wide—or else broad rough hard-wood slabs on the soil on which to walk, and then with slight mulching of horse-dung (on the south border only), and a very slight pricking up of the soil in the month of April, and one again in July or August, a border made as described would be so genial a medium for the roots of fruit trees, that in only the worst of soils would it be thought necessary to put in impervious bottoms of concrete, rubble, coal-ashes, or stone slabs, beneath the trees, and there would be, moreover, not any fear that the soil would become either waterlogged or too dry. As a site for pushing forward early crops there is no better place than a warm, deep border, facing south, and having a slope that increases the angle at which the sun's rays impinge upon it. *F. M.*

#### FRUIT REGISTER.

##### PEARS.

I NOTICE that Yvonné Boussois is favourably spoken of by Mr. Ward, but its good looks are about its only recommendation, and it is to be hoped that sorts having real quality and high flavour will take their proper place at exhibitions, and be placed before such as have mere size and showy appearance to gain the awards. Beurré d'Amanlis is more passable than the one just referred to, but that is not first-rate, and as it comes in at the same time as Beurré Superfin and Fondante d'Automne, it is far better to grow these in its place. What is wanted is a much abridged list of varieties, and no garden, however large, need have more than twelve or fifteen sorts; and if these are judiciously selected they will give more satisfaction than any collection. My selection would be as follows, taking them in the order of ripening:—First, Williams' Bon Chrétien, Fondante d'Automne, Beurré Superfin, Marie Louise, Doyenné du Comice, Glou Morceau, Winter Nelis, Josephine de Malines, Bergamot Esperen, Beurré Rance. Glou Morceau requires a good situation to grow it really well, but in favourable soils or districts it succeeds admirably on the Quince, coming quite clear in the skin without any cracking. Bergamot Esperen and Beurré Rance also need warm aspects, and should

be left on the trees as long as they will hang, as that makes a great difference to their finish and keeping. *J. Sheppard, Ipswich.*

##### PEAR MADAME TREVET.

At Mereworth Castle, Kent, this deliciously-flavoured free-bearing Pear generally ripens from the middle to the end of September. The fruits when ripe are not, however, as handsome in colour as many other things, being of a somewhat greenish yellow on the shaded side, but on the side next the sun frequently the fruit becomes a bright crimson colour, marked with numerous russet dots. It is one of the most reliable kinds we grow, and bears annually marvellous crops of good-sized fruits, clean in the skin and of good shape. In its slightly perfumed flavour there is something extremely pleasant to the taste, which differs considerably from that found in other Pears. The flesh is almost white, free of grit, full of juice, and with but very small core, and in its season keeps as well as any other Pear which ripens about the same time.

##### PEAR TRIOMPHE DE VIENNE.

This is another fine prolific variety, and of remarkably good quality, ripening about the same time as the above sort. Mr. Bunyard, in his Fruit Catalogue, mentions that this is a new variety. It is of great excellence, and our standard trees have borne good crops for three years running. The fruit is of a russety brown, large, and handsome in colour. The flesh is rather gritty, but it is very rich and melting, I do not find the flavour of any Pear or Peach, this season equal to what it was in the last. *H. Markham, Mereworth Castle.*

##### GOLDEN EAGLE PEACH.

In many establishments where Peaches are in demand late ones are as much appreciated as early ones. As this is the case here I have been to some trouble and expense to find the best varieties, and enclose you samples gathered this day from a tree carrying seven dozen handsome fruit. Your impartial opinion as to quality will afford the best guarantee. It will be sufficient for me to say that we have fruited Golden Eagle for three years, and it has been highly satisfactory. Grown in a late Peach-house and started naturally it makes a good succession to Walburton Admirable, and Princess of Wales. I am not much in favour of yellow-flesh Peaches, but as this is so useful I cannot despise it. Owing to the severe weather we have used a little fire-heat this year. The tree is not a gross growing variety, but medium, rather Willow-like shoots, quite free from mildew or fly. I enclose samples of Apricots also, as a novelty; we have been gathering a long time. When put in a warm place for a few days they make an uncommon dish of dessert of fair quality. *J. H. Goodacre.* [The Golden Eagle is a fine showy fruit, but of indifferent flavour. The matter of flavour is doubtless due to want of sun-heat and light and free ventilation—all unprocurable things during an English October. Ed.]

#### ROSES.

##### TEA AND NOISETTE ROSES.

"WILD ROSE" does good service in combating the mischievous superstition that the Tea-scented Roses are too tender for general cultivation in this country. There may be some few bleak situations in the Midlands where the plants require considerable protection in winter, but there is abundant proof that north, south, east, and west these most beautiful of all Roses may be successfully grown upon the native Brier seedling or cutting stock, and in all probability their culture on their own roots is destined to become considerably extended.

Whether "Wild Rose" has got the true reason for the failure of the Tea-scented Roses upon the Manetti stock seems doubtful, because *Rosa multiflora*, which grows just as early in the season as Manetti, and is even more vigorous, makes an

excellent stock for Teas. At any rate, another possible explanation might be, that the Manetti as a stock is short-lived, and unquestionably in many soils and situations perishes after two or three years; many hybrid perpetuals budded on it appear to thrive continuously because in that time they are able to establish themselves upon their own roots and are independent of the stock; but the Tea-scented Roses, not so readily converting themselves into own-root plants, must needs perish with the stock.

Perhaps, however, the difficulty arises from some inherent lack of sympathy between stock and scion, just as some fruit trees will grow on certain stocks for a year or two, and then fall altogether, although it is not at all apparent outwardly in what way the stock on which failure ensues is less well adapted to the scion than the stock, which eventually becomes the supporter of a continuously fertile tree. The point is one which, in all probability, must remain a matter of speculation, since nobody any longer grows Teas on Manetti, and therefore direct observation is impracticable.

The importance of keeping the essential qualities of vigour and a good constitution prominently in view in making a selection of varieties for a small collection cannot well be over-estimated, but considering that Jean Ducher possesses these qualities in a marked degree, that it is a most free and perpetual bloomer, large and constant in form, and that for the last half-dozen years it has always been one of the most prominent and magnificent of its class; until, in fact, the past season, when practically none of the Teas except Madame Lambard were seen to conspicuous advantage—it might have been thought that "Wild Rose" would have found it in his heart to include it even in the most select list, especially when it is seen that he recommends so difficult an opener as Etoile de Lyon, such a victim to mildew as Madame Cusin, and two such moderate growers as Souvenir de Paul Néron and Sunset.

Etoile de Lyon is a very beautiful Rose when at its best, and the habit and striking red foliage of the plant render it attractive even when not in flower, until mildew, to which the variety unfortunately is prone, appears; and there is little question that it is also the finest yellow Rose next to Maréchal Niel for cultivation under glass. But out-of-doors, although a careful cultivator will get a fair number of good blooms during the season, he will find that they take a considerable amount of "getting"; and many are the complaints of growers as to the number of unopened buds that are liable to disfigure the plants. The petals are very numerous and very thin, so that in case of wet they stick together, and it is probably the fact that the variety is one of those for which our climate is not sufficiently hot and dry. If a poll could be taken of growers who have cultivated both Jean Ducher and Etoile de Lyon, say for three years, as to which of the two they would discard if it were necessary to give-up either, it would probably be a very safe prophecy to make, that it would not be Jean Ducher that would be dismissed.

"Wild Rose" says he writes for beginners, but as many people begin Rose-growing with a view to exhibiting, it will at all events be as well to point out that for many years Jean Ducher has never failed to be among the twelve Teas most frequently exhibited with success (in several seasons being almost at the top of the list), a distinction attained but once by Etoile de Lyon, which, as a general rule, is exhibited successfully just about half as often as Jean Ducher.

The flowers of Madame Cusin are very beautiful when grown under glass, but out-of-doors the colour is not always so pleasing, the foliage is small and insignificant, and the plant, not over-vigorous or free at any time, gets smothered with mildew. It might well be replaced in a small collection by Ethel Brownlow, a flower somewhat similar in form, but more pleasing in colour, a handsome plant, resisting mildew, and an exceedingly free and perpetual bloomer.

Etoile de Lyon might be replaced by the strangely neglected Amazone, which is invaluable either for

exhibition or for cutting in all seasons; some cultivators have called it thin, but when it is generously grown it is certainly not so, and it is one of the richest of all the yellows, giving exceptionally fine flowers in autumn.

Souvenir de Paul Néron, one of the loveliest of all Roses, is certainly not a good furnishing plant, the leaves being small, and set at long intervals upon the stem, while it is the experience of many rosarians that it is a slender grower, and very difficult to get the blooms of any size. There is no Rose exactly of its colour or character to take its place, but for freedom and constancy a useful substitute might be found in the charming Souvenir de Gabrielle Drevet, which is quite ever-blooming and always attractive in form and colour.

If "Wild Rose's" beginner be an intending exhibitor he will do well to avoid Sunset, and instead to plant Francisca Krüger, a beautiful Rose, somewhat analogous in its shades of orange and coppery-yellow, most constant in form, and a vigorous grower, flowering freely early and late. If only buds for

is vigorous and most handsome, clothed with abundant foliage which is almost evergreen, and it is a most reliable autumnal; the flowers, produced in the utmost profusion, are unique in form and colour, approaching more nearly than any other Rose to that of burnished copper, lighted with touches of nankeen-yellow and apricot. In fact, Ophirie is almost an ideal pillar Rose, the growth not being inordinately long, being always a dense mass of foliage, which, resisting mildew, continues green and bright, while the plant produces its trusses of charming flowers until cut off by winter frosts.

Whatever varieties may be planted, however, there is no question that Tea-scented Roses should be cultivated everywhere. They are essentially the universal Roses; they will grow on hot gravelly soils where other Roses will scarcely live through a year; magnificent plants may be seen in the deep sandy peat where Rhododendrons luxuriate, but where the most careful cultivation of hybrid perpetuals results only in comparative failure; and yet all they want to thrive in perfection on strong heavy

(THE PROGENITORS OF THE TUBEROUS BEGONIA. SEE P. 534.)

bouquets or cutting be wanted Madame Charles is more beautiful in colour than Sunset, whose chief value is as an early forcing Rose to supply abundant buds for buttonhole bouquets soon after Christmas.

There is one other Tea which may confidently be recommended as a good grower, producing both in summer and autumn consistently fine flowers of pleasing flesh-colour with yellow and rosy tints: it is called Comtesse de Panisse, and is not nearly so much grown as it deserves.

That in his selection of the six best climbers, "Wild Rose" should include Madame Eugène Verdier is a cause of surprise, for beautiful and distinct as is the rich chamois-yellow colour of this Rose, yet the growth is not particularly free or vigorous for its class; it gets badly cut back in the winter by frost; the few flowers do not open until extraordinarily late in the season; and, in spite of the cultivation of about a dozen plants ever since the variety was sent out—that is to say, for five or six years—I have not yet obtained a first-rate bloom, nor seen one at an exhibition, nor in anyone else's garden. As far as my experience of it goes, this variety has one recommendation only—that of distinctness of colour. On the other hand, why should not the beautiful Ophirie be recommended for universal cultivation? The plant

land is to have it well drained, in order that their roots may not lie wet in winter. Under these circumstances let everyone be enjoined to plant Teas—the best varieties if possible, on seedling Brier stocks if possible (at any rate, to begin with), in a good situation and soil if possible—but, any way, "plant Teas!" *Theta*.

## CHISWICK.

The latter part of your leading article last week brings under the attention of the horticultural world a question of vital moment to the Royal Horticultural Society, the solution of which cannot be for a moment deferred—I mean the future destiny of the Chiswick garden.

It is impossible, however, to plunge into the discussion of this matter without ascertaining, by a reference to the past, the present actual position of affairs. For many years past the primary element in the work of the Chiswick garden has been the supply of decorative plants for the conservatory and grounds at South Kensington. I do not mean to say that its proper functions have been altogether neglected, and it is to the credit of Mr. Barron that every year much useful work has

actually been done. But it has been in great measure subsidiary to the decorative work, which, of course, has been neither useful nor interesting to horticulturists generally. All this has, however, come to an end, and there is now no administrative obstacle in the way of devoting Chiswick to any purpose by which the interests proper of horticulture may be served.

The present is undoubtedly the proper time to approach the question. The past year has been in every way a critical one in the fortunes of the Society. It had to start in new quarters, and on lines which were necessarily largely experimental and tentative. It had to face a large defection of its members, and it was sorely hampered with debt. By the self-sacrificing exertions of a number of gen-

into, but the problem, as a whole, has not been faced.

But the time has now arrived when this must be done, if it is ever to be done at all. My object, then is to raise a discussion of the whole subject. I dare say it will be thought that I ought in the first place to communicate my views to my fellow-members of Council rather than to your columns. But this is a matter in which the Council can only act as our executive. It must look to the general body of Fellows and to the horticultural world to decide the policy which in the future is to be pursued in the management of the Chiswick garden.

What that policy should be I myself have very little doubt. Probably, however, my own views will

tions, should be treated as the natural complement of Kew. Very likely this suggestion will at once provoke an outcry. Very well; but let us examine it a little more in detail.

I do not know how it is with other people, but I myself always feel, when I visit Chiswick, impressed with its extreme dullness. There is the great vinery, of course, and when the Grapes are ripe in the autumn this is a beautiful spectacle. Then there are the pyramid fruit trees, and the trials which happen to be going on. But all these are very soon inspected, and the eye searches in vain in going round the garden for anything to excite and stimulate interest.

How is this to be remedied? It seems to me that if, instead of the botanical collections which we have at Kew, an attempt were made to get up horticultural collections, a great deal that would be extremely novel and interesting to visitors might be shown in a very small space. For example, two years ago we grew a collection of Gourds at Kew, from seeds obligingly given us by Mr. Barr. It was quite remarkable how much interest they excited. At Berlin, I am told, there is a Gourd garden which is very much admired. Why, then, should not a standard collection of every distinct kind of Gourd be grown every year at Chiswick? And if Gourds, why not other kinds of vegetables? My plan would involve their growing in a scientific way with proper labels all the distinct sorts of vegetables described in Vilmorin-Andrieux's *Les Plantes Potagères*. And I would go farther; with the horticultural resources of Chiswick there should be no difficulty in growing all the odd plants in Pailleux and Bois' *Le Potager d'un curieux*. This is what I mean by making Chiswick a horticultural Kew. I would make it the home of every sort of vegetable to be found in European gardens. I am sure if intelligently carried out that the plan would be found both interesting and useful. I should like to see it carried out at Kew, if it were possible; but then it is not possible.

The annual trials of vegetables [and flowers] should of course be continued; and nothing could be better than the astonishing collection of Tomatoes which Mr. Barron has so successfully cultivated this year. But the results of these trials should be promptly published in the *Journal* of the Society.

Another department which I would develop at Chiswick is that of herbaceous plants. We grow at Kew an enormous collection arranged in systematic order for convenient access. We are often told that the general effect is unsatisfactory. I cannot help that. It is not contemplated that it should be otherwise. At Chiswick this might, however, be managed. The best herbaceous plants might be grown, so as to show them to the greatest possible advantage. Again, in the case of those which have been long known in gardens and have broken away into numerous varieties, it is impossible for us at Kew to grow more than a few select kinds. But at Chiswick from time to time collections might be got together—say, one year of *Pæonies*, another of *Irises*, a third of *Larkspurs*, and so on. At Kew, moreover, although we take great pains with our herbaceous department, we do not always find it either practicable or desirable to represent every given species by its best horticultural form. This need, however, present no difficulty at Chiswick. The division of labour between the two establishments is obvious; taking the same subject, one would represent its botanical, its other the horticultural aspect.

Chiswick has not now sufficient space to do much in the way of hardy shrubs; still it might do something with the best. And with its large area of glass it might show in the way of greenhouse plants everything that was new and fresh of purely horticultural interest. The Fellows ought to be able to see from time to time what is valuable, interesting and novel; they should have, in fact, a standard permanently put before them on which they could rely.

As to fruit, I have little to suggest, except to maintain and expand the existing collection. All

FIG. 77.—*BEGONIA SOCOTRANA*: FLOWERS PINK. (SEE P. 534.)

tlemen, some on the Council and some off it, the Society has been pulled through. Its work has been kept going in the new quarters, its debt has been paid off, and it has received a large accession of new members. I do not pretend that all its arrangements are still everything that can be desired—no doubt they are not so; but I challenge any fair-minded man, looking at the retrospect of the year's work, to say how any better result could have been attained in the time.

With the continuous work in the virtual reconstruction of the Society which the Council has had before it, its meetings often lasting three hours at a stretch, it was practically impossible that the Chiswick problem could be radically dealt with. It has not been neglected; on the contrary, a vast amount of detailed administration has been gone

not command universal consent—in horticulture, I observe, that the views of any one person very seldom do. Still, I propose to state them in order that they may, if possible, elicit something better. For be it observed what is wanted at the present moment is a policy; and if one can be framed, which will command the general assent of horticulturists, and be in its essential features horticultural, I for my part am quite prepared to accept it.

My own policy, then, is for the Society to make Chiswick a horticultural Kew. The latter establishment is, by virtue of the conditions enforced by the House of Commons when the Royal Gardens became national, treated throughout from a botanical point of view. There are large branches of horticulture which are, therefore, altogether excluded from its scope. Chiswick, in my view, in position and func-

old and out-of-the-way fruits should be got together and grown, so that the Fellows might know of some one place where they may certainly count upon seeing all that they may happen to hear of.

The old orchard-house collection seems to have disappeared. I rather regret this. It was always a very pretty sight, and the recent Conference showed that in a year like the past it is only under glass that many of our hardy fruits show the utmost they are capable of.

But besides growing a standard named collection, there should be illustrations of every kind of experimental treatment. The advantage of different kinds of stocks should be shown to the eye as well as the merits of different methods of training and grafting.

I am afraid this letter has run to an inordinate length, and yet I have by no means exhausted all the suggestions that occur to me. Throughout the summer I would have "Chiswick days"—not shows, but days when particular features of the garden work were in their most interesting stage, and at their best. To these the Fellows should be summoned by post-card, so that they might have the opportunity of having their attention pointedly called to the work that was going on. Eventually, I should like to see a handy Guidebook, giving a brief account of the most interesting features of the garden.

If Chiswick were energetically worked in the spirit which I have indicated in these remarks, and made a really living thing, I cannot doubt that it would become an extremely interesting place, in its way as attractive as Kew. When I say make it a horticultural Kew, I mean make it a place where there is something to see which would give a definite impression of intelligible work being carried on. *W. T. Threlkeld Dyer.*

## THE WHEAT CROP OF 1888.

In estimating the produce of the Wheat crop of the United Kingdom last year, I adopted without modification the indication of the usual selected plots in the experimental field at Rothamsted; observing, however, that the figure so arrived at probably under rather than over-estimated the crop of the country. The yield so indicated was 28½ bushels per acre, at the standard weight of 61 lb. per bushel; and as compared with the requirements estimated on that basis, the actual nett imports within the harvest-year showed a deficiency which is too great to be explained by the reduction of stocks in the granaries, and, in the hands of farmers, there can be little doubt that the yield of the country was in fact higher than was assumed according to the estimate adopted.

The Wheat crop of the present year, which has hardly yet been secured over the whole of the British Islands, was at one time supposed by some to promise to be one of the worst of the present century, and probably as bad as that of 1870. Very little consideration of the characters of the two seasons is, however, sufficient to show that the year just past was much more favourable to the Wheat crop than that of 1878—9.

First, as to the rainfall. Taking the records of Greenwich in illustration, there was, during the harvest-year, September 1, 1878, to August 31, 1879, an excess of rain in every month, excepting October, December, and March, and there was also an excess in September, 1870; the total excess for the harvest-year amounting to about 10 inches, and compared with the season just past there was a considerable excess in January, February, April, May and again in the harvest months of August and September. Further, whilst the harvest-year 1878—9 commenced with a wet soil, that of 1887—8 commenced with the soil in a very dry condition, owing to the drought of the previous summer; and notwithstanding there was an excess of rain in March, 1888—when, indeed, it was much wanted—there was, taking the whole period up to nearly the end of June, so great a deficiency compared with the average that fears were entertained that there would be a deficient supply of water both in the country districts and in some of our large towns. In June, July, and August, there was, however, a considerable excess of rain, and it was during this period that so much

anxiety as to our cereal crops prevailed. At Rothamsted there was a very heavy thunderstorm on June 26, which gave more than 3 inches of rain in a few hours; and there were heavy thunder-showers about the same time in other localities. In July there was more or less fall almost every day of the month; whilst in August there was again a considerable excess. As to temperature, both seasons were below the average almost throughout the harvest year. The winter months of November, December, and January showed much lower mean temperatures in 1878—9 than in 1887—8; but February and March were upon the whole colder in 1888 than in 1870. April, May, and June were, however, on the average warmer in 1888 than in 1870. Whilst, therefore, the mean temperature was below the average in both seasons, both in the winter and the summer, not only was it not so low during the growing months of 1888 as in those of 1879; but there was a very great difference in the rainfall of the two seasons; for whilst in 1878—9 there was a great excess of rain throughout the winter, spring, summer, and autumn, there was in the season just past a considerable deficiency throughout the winter and spring, and only an excess in June, July, and part of August, September again being upon the whole a dry month. The great influence on the subsequent growth of Wheat, of the weather before the period of active aboveground growth, was clearly illustrated in our paper on "Our Climate and our Wheat Crops" in the case of the season of 1854. The summer of that year was comparatively cold and sunless, yet the Wheat crop was one of the best of the present century. The early winter had been unusually cold, but the remainder and the early spring were warmer than the average, and the season was extremely dry from seed time to harvest, the mild spring and the dryness obviously compensating for the deficiency of temperature during the summer months.

The following table gives the produce of Wheat in 1888 on selected plots in the experimental field at Rothamsted, which has now grown the crop for forty-five years in succession. The plots are the same as to description and quantities of manure applied as have been adopted in the estimates of the yield of the country at large from 1852 up to the present time.

Harvest.	Unmanured.		Farmyard Manure.		Artificial Manures.		Mean of Plots 7, 8, and 9 (or 16).		Mean of Plots 3, 4, 5, 6, 7, 8, 9, 10, 11, 12, 13, 14, 15, 16, 17, 18, 19, 20, 21, 22, 23, 24, 25, 26, 27, 28, 29, 30, 31, 32, 33, 34, 35, 36, 37, 38, 39, 40, 41, 42, 43, 44, 45, 46, 47, 48, 49, 50.	
	Plot 3.	Plot 4.	Plot 5.	Plot 6.	Plot 7.	Plot 8.	Plot 9.	Plot 10.	Plot 11.	Plot 12.

\* Equal to 26½ bushels, at 61 lb. per bushel.

† Equal to 26½ bushels, at 61 lb. per bushel.

‡ Equal to 26½ bushels, at 61 lb. per bushel.

§ Equal to 26½ bushels, at 61 lb. per bushel.

An examination of the figures shows that, again this year, there is marked deviation from the average produce on the different plots, and that the variation is in different directions, according to the conditions of manuring; and, perhaps, there has seldom been a harvest in respect to the results of which the reports have been more conflicting than of that of the present year.

The general character of the experimental results is that, both where the condition of the soil was defective, and where there was an excess of artificial nitrogenous manure, there was less than the average produce; but that where the manurial conditions were more favourable, there was more than average produce. Thus the continuously unmanured plot yields only 10 bushels per acre, instead of about 13 bushels, the average of the preceding ten years, or 13 bushels, the average of the preceding thirty-six years. The farmyard manure plot, on the other hand, yields 38 bushels, of 60 lb. per bushel, against an average of only 32½, but of nearly 61 lb. per bushel, over the preceding ten years, and of 33½ bushels, at 60½ lb. per bushel, over the preceding thirty-six years. That is to say, whilst the unmanured produce is about 3 bushels below its average of 13 bushels, the farmyard manure produce is more than 4 bushels above its average of 33½ bushels. Again, plot 7, which receives, besides mineral manures, a liberal but not excessive amount of salts of ammonia, yields nearly 36 bushels, at 59½ lb. per bushel, against an average of only 33½ bushels at the same weight, over the preceding thirty-six years; that is, it gives an excess this year of rather over 3 bushels. Plot 8, on the other hand, with the same mineral manures but ½ time as much salts of ammonia as plot 7, yields only 35½ bushels against its average of 36½ bushels; that is, with the excess of ammonia-salts, there is this year 1½ bushel less than its average, and even less than with the smaller amount of salts of ammonia. The mineral and nitrate plot again (9 or 16), yields only 33½ bushels, against its average of 36½ bushels, showing, therefore a deficiency of 3 bushels this year.

We were to go beyond the list of the usually selected plots, more striking illustrations still could be given of the fact that in the present season the produce was below (and sometimes very much below) the average, where the conditions were unfavourable or abnormal, but that where the conditions were favourable or normal it has been over average. The produce of straw shows a very similar result. Thus, without manure, and with excessive nitrogenous manuring, the amount of straw is considerably below the average; but with farmyard manure it is considerably over average, and on plot 7, with comparatively moderate artificial manuring, it is very nearly the average.

We have then, in the experimental field, great irregularity in the amount of produce compared with the average of seasons, accordingly as the conditions of manuring were favourable or unfavourable; but the irregularities are generally in an opposite direction to those of last year. As already said, the published reports from different parts of the country also show very great irregularity of result. Indeed, it would appear that the season has pretty generally been unfavourable both for low and for excessively high condition, but favourable for less extreme conditions. So far as quality is concerned, as indicated by weight per bushel, the experimental crops are generally somewhat below their average.

It will be obvious that with a season showing such irregularities it must be difficult to form an accurate estimate of the average yield of the country at large. The average, calculated in the usual manner, from the results of the selected experimental plots, amounts to 26½ bushels per acre, at the standard weight of 61 lb. per bushel—that is, only about 1½ bushel below the standard average of 28 bushels. As already said, in adopting the average of the experimental results last year as indicating the average of the country at large, it was supposed that the crop was under rather than over estimated, and it is possible that the figure for the present year may err somewhat in the contrary direction and rather over-rate the crop of the

country. There can, at any rate, be no doubt that the average produce of the harvest of 1888 is inferior to that of 1887 both in quantity and in quality. But notwithstanding the irregularities and deficiencies which have been referred to, it is certain that in many cases much more than average crops have been obtained. I propose therefore to base my estimate of the produce of the United Kingdom this year on the experimental results without modification, leaving it to others, and to the future, to determine whether any deduction from the estimate so arrived at should be made.

Taking the average population of the United Kingdom for the harvest year, 1888-9, at rather over 37½ millions (37,771,175), the estimated requirement for consumption, at 5·6 bushels per head would be about 26½ million quarters (26,075,892). The area under wheat is reported to have been 2,663,436 acres, or nearly 300,000 acres more than last year. This area at 26½ bushels per acre would yield nearly 9 million quarters (8,947,480), and deducting 2 bushels per acre for seed, there would remain rather over 8½ million quarters (8,281,621) available for consumption, and there would accordingly be required about 18½ million quarters (18,394,271) to be provided from stocks and import. It is admitted that the Wheat crop not only of America, but of some other countries whence we derive supplies, will be below the average. But during the last two months of the past harvest year our imports were at the rate of about 21 million quarters per annum, whilst, with our late harvest, and the rise in prices, the supplies have been very liberal since, and there seems no reason to fear that there will be any difficulty in obtaining sufficient supplies to meet such requirements as the foregoing estimates show to be probable. *J. B. Lawes, Rothamsted, October 24.*

## PLANTS AND THEIR CULTURE.

**LIBONIAS.**—Although these do fairly well when kept in an ordinary greenhouse at a temperature of from 40°–50°, yet they are much improved, and young stock in particular, by being kept in a temperature not exceeding 55°. Here, with due attention to watering and full exposure to light, a genial buoyant air about them, they do not so readily shed their leaves—a fatality occurring under lower temperature without fail. Kept too warm, the plant makes soft growth and rarely flowers. Sturdy well matured growth is the sort to flower well. Large old plants of *L. floribunda* are very useful during the early spring months, but penhosiensis is already showing flower. It is a rather nester subject, and, flowering as it does, so much in advance of *floribunda*, renders it a very desirable plant.

**Solanum capsicastrum.**—Outdoor plants have not done so well this year, and the few which have set well are late, but they will still colour well. A few may be hastened by placing them along with the Libonias, guarding against their getting dry at the roots, as they are very impatient and much injured if the soil be kept too dry.

**Cold Pits and Frames.**—All plants intended to be wintered in these structures should now be systematically arranged for the winter, in all cases keeping those requiring similar treatment together, as far as practicable. In this way those which require more warmth may be properly protected without having to cover others which are more hardy. It is also good practice to completely plunge the pots, as by doing so there is less fear of breakage, the roots kept uninjured, and watering is much reduced. An important point in the management of this class of structures during winter is to maintain a sweet, dryish atmosphere in them, as in the majority of cases the losses which occur are due more to dampness than to cold; therefore, whenever the days are fine, ventilate freely and early when there is no frost, but in dull or rainy weather give little or no air, specially guarding against opening during fogs. These concluding remarks are very applicable to Violets and Auriculas.

**Poinsettias.**—These like a position somewhat drier than winter-flowering subjects, and a good brisk stove temperature is beneficial, care being taken to afford them all the light possible. Under these conditions the bracts develop with a firmer texture, and are rendered more lasting when removed to cooler positions. Late struck and successional plants may

be potted as they require it, taking care not to over-pot, for large heads may be produced in very small pots, and 5 or 6-inch pots are convenient sizes. A free, loamy compost suits the Poinsettia; but in peat the plants are difficult to keep in good condition.

**Euphorbia Jacquiniaeflora.**—This pretty winter bloomer flourishes similar to Poinsettia pulcherrima, but there is this important difference, that *E. Jacquiniaeflora* gives, when growth is rapid, a succession of flowers, breaking back as the points are removed, but it requires to be kept in a light place, and in a warmth of 60° as a minimum. *F. Ross, Blethingly.*

## THE FLOWER GARDEN.

**BEDDING PLANTS: INDOORS.**—It will be advisable to look over autumn rooted Pelargoniums where they are being wintered in badly heated and ventilated structures, or there will be a large number of the plants die from damping off. Pick off all decaying flowers and leaves, but not the leaf-stalks, and in watering keep the soil rather dry than otherwise, affording plenty of ventilation on every favourable occasion. Old plants of Pelargoniums and various other bedding subjects should be cleaned and the soil in the pots slightly stirred with a stick. Fumigate to keep down aphids. The above plants should be placed as near the glass as is practicable, and a night temperature of from 45° to 50° in severe weather may be kept up. Iresines, Coleus, Alternantheras, and other tender subjects should have 10° more warmth. Should mildew make its appearance, dust the leaves over slightly with sulphur.

**Frame Ground.**—Although comparatively little work will require to be done here for some time nothing must be left to chance, i.e., in the way of covering the frames with mats at night; it is hardly safe at this time of the year to trust to the favourable appearance of the weather, even for a single occasion, and it is as well to bear that fact in mind in regard to such half-hardy plants as some Echeverias, and the shrubby Calceolarias.

Autumn rooted cuttings in pots of Phlox, Pentstemon, and young stock of hardy perennials, should be plunged in sifted cinder ashes or cocoa-fibre refuse. Take off the lights on bright days and be careful with the water-can, as over-watering is sure to be productive of a sour soil, clogged drainage, and consequently sickly-looking plants. Examine the pots occasionally for earthworms, and keep the surface soil free from moss.

**Miscellaneous.**—Such work as filling certain beds in the winter garden with Conifers, Aucubas, *Herberis aquifolia*, &c., should be pushed forward without delay. Some very effective arrangements of these subjects may be made with the various tints and forms of the foliage of these plants. If not already done, take up Tigridias and Gladiolus, and store away in a cool place safe from frost, neither too damp nor too dry. *J. Horsfield Heytesbury.*

## FRUITS UNDER GLASS.

**VINES.**—The Vines in the early house must now be pruned, dressed, and everything got in readiness for a start about the middle of the month; the night temperature may be kept steadily at 50° on cold nights, but on mild ones it may run up to 55°. On dull days raise the heat to 60°, syringe the Vines frequently with tepid water, and if a bed of warm tree-ferkes be placed within the Vinery, and a portion be laved over every morning, it will aid in maintaining an atmosphere genial to the breaking the Vines. The best mode of securing the earliest supply of Grapes without weakening the permanent Vines is, unquestionably, from well-ripened pot Vines. If these be plunged in a bed of leaves having a temperature of 75° to 85°, and be frequently syringed with tepid water, they will break much easier than Vines with their roots in the soil of a border; and if these pot Vines be not cropped too heavily, they will produce a respectable crop of good fruit. Let the temperature for starting be 50° gradually increasing it to 55° by the end of the month. It is November when the leaves fall from the Vine, and it is perhaps the worst month in the year for keeping hanging Grapes; therefore, where the leaves are falling it is better to cut the bunches, leaving 7 or 8 inches of shoot to the bunch, and insert them in bottles of

water in the Grape-room. This room should be on the north side of the garden wall or other buildings, should be quite dark, with heat at command, so that a steady temperature of 45° may be ensured. With this degree of warmth, and well-finished fruit, there will be scarcely a bad berry visible during the next three months. Look over all Grapes hanging on the Vines twice or thrice a week, and remove all decaying berries.

Proceed with the preparation of succession-houses, and cover the outside borders with dry leaves as they are collected—this will retain much of the solar heat. Especial care must be taken to cover securely any borders the soil of which has been renewed during the past twelve months, and is full of young roots. It may be accepted as a fact that if the temperature in these borders declines below a certain point every young root will assuredly perish. Proceed with the collection of materials and the formation of new borders or renovation of old ones during the coming winter and spring. Keep all the materials in as dry a condition as possible, thereby preserving all the fertilising properties and securing a more workable state of the material.

Young Vines which were planted during the past season will require an extra amount of fire-heat to properly ripen the canes, therefore continue to apply artificial heat and ventilation until the foliage has fallen naturally, when the Vines should be cut back to the first wire, and the house thrown open, except during frost. *Wm. M. Baillie, Luton Ho.*

## THE KITCHEN GARDEN.

**PROTECTION OF BROCCOLI.**—Protecting material's will be necessary, the luxuriant growth of the plants this season making them very susceptible to frost. As the most tender part of the plant is the soft portion of the stem, from whence the leaves spring, and this gets much exposed when snow or severe frost causes the leaves to droop; the aim should be to protect this part. In places that are well sheltered or naturally warm, a covering of dry bracken put over the plant in frosty weather will often prove effectual in averting loss; and if the heads are formed, as will be the case with some early varieties, tying the leaves together at the top with matting will help to save the heads; or, better still, such plants may be lifted and placed in a shed or greenhouse with a little damp soil around their roots. This practice of lifting reduces the size of the heads to a certain extent, but that does not matter much, small heads being required as well as large ones. If any Autumn Giant Cauliflowers remain until now, and Veitch's Self-protecting Autumn Broccoli is coming in, these should both be lifted, and in the case of the latter as soon as the heads are formed. It will be advisable this year to lay all the late Broccoli, taking out a portion of soil behind, and some in front of each plant, and then pressing the latter down, cover the stem with the soil taken from the next plant, as the work proceeds. When treated in this way, the heads of the plants should lie towards the south, as when laid the other way the sun is apt to draw the leaves of the later varieties up again before the winter is over, and expose the head. Broccoli treated in this way are, comparatively speaking, safe from frost, as the leaves cannot drop down and expose the stem; but to make them as secure as possible, they can easily be covered over with bracken or dry litter when severe frost is expected.

Asparagus beds should now be cleared of weeds and rubbish, and advantage taken of the first hard frost to get a quantity of decomposed manure spread over them; and where beds are old, and produce only weak shoots, the roots may be lifted in a fortnight's time, and afterwards as required for forcing.

**Endive and Chicory, &c.,** will be useful for salads now that Lettuces are scarcer; a very quick and clean way of blanching them for use is to take up the roots as required about a fortnight before they are wanted, and put them in a Mushroom-house or a similarly dark and warm place. Endive may also be well blanched by being covered with pieces of slate or tiles, just leaving beyond the cover a fringe of leaves, litter being placed over the plants in frosty weather.

White Turnips should be stored now before they get damaged by severe frost, and be placed in a cool cellar after the tops are removed; but the roots are best when placed in small heaps and covered with soil. The variety, Chirk Castle, keeps plump and firm longer than any other. *W. H. Divers, Kelton Hall, Stamford.*

## APPOINTMENTS FOR THE ENSUING WEEK.

## MEETINGS.

MONDAY,	Nov. 12—	"Chambre Syndicale" of Ghent.
TUESDAY,	Nov. 13—	Royal Horticultural Society: Scientific, Fruit and Floral Committees, and Special General Meeting of Fellows.

## SHOWS.

TUESDAY,	Nov. 13—	Brighton, Winchester, Cardiff, Watford, Twickenham (two days each), and West Kent, Hammersmith, and Leazes (one day each).
WEDNESDAY,	Nov. 14—	Ancient Society of York Florists and Royal Cornwall Polytechnic (three days); and Market Harborough, g.b., Bradford, and Bromley (two days).
THURSDAY,	Nov. 15—	Wiltshire (two days), and Royal Horticultural of Ireland, Penzance, Aylesbury, Reading, Wimbledon, and Taunton.
FRIDAY,	Nov. 16—	Sheffield (Provincial Show of the National Chrysanthemum Society), and Rudgefield (two days), and Devon and Chiswick
SATURDAY,	Nov. 17—	Ramsbottom and Derby.

## SALES.

MONDAY,	Nov. 12—	Dutch Bulbs, at Stevens' Rooms. Dutch Bulbs, at Protheroe & Morris' Rooms. Plants and Bulbs, at Small's Rooms.
TUESDAY,	Nov. 13—	First Portion of the Collection of Orchids formed by E. Wischhausen, Esq., Wood Green, at Protheroe & Morris' Rooms. Greenhouse Plants, Roses, Fruit Trees, &c., at the City Auction Rooms, by Protheroe & Morris. Nursery Stock at Cobbett's Nursery, Woking, by Protheroe & Morris (three days).
WEDNESDAY,	Nov. 14—	Dutch Bulbs, Roses, and Fruit Trees, at Stevens' Rooms. Lilium auratum from Japan, Camellias, Azaleas, &c., at Protheroe & Morris' Rooms. Dutch Bulbs and Plants, at Small's Rooms.
THURSDAY,	Nov. 15—	Orchids in Flower, and 5000 Lilium auratum, at Stevens' Rooms. Dutch Bulbs, at Protheroe & Morris' Rooms. Landscape Nursery and Shop at the Waverley Nursery, Finchley Road, by Protheroe & Morris.
FRIDAY,	Nov. 16—	Imported Orchids, at Protheroe & Morris' Rooms. Dutch Bulbs and Plants, at Small's Rooms.
SATURDAY,	Nov. 17—	Roses, Fruit Trees, Dutch Bulbs, &c., at Stevens' Rooms. Dutch Bulbs, at Protheroe & Morris' Rooms.

The Future of  
Chiswick.

THE meeting on Tuesday next at the rooms of the Royal Horticultural Society, 111, Victoria Street, is likely to be one of great importance as regards the future operations of the Society, and in particular as to the destiny of Chiswick. On this account we earnestly hope that those who have the interest of the Society at heart will be present, or respond to the invitation of the Council, and communicate their views as to what should be done. The Council deserve, and will receive, the warmest thanks for what they have done during the past year to resuscitate the Society. Their labours, as we know, have been very heavy, but they have their reward in the fact that the Society is, by their exertions, free from debt, and that it is altogether in a more healthy state than it has been for years past. One sign of the spirit that animates the Council is shown in the tendency they manifest of confiding in the Fellows and calling them into consultation when circumstances render it desirable. To discuss the whole subject either in these columns or at the meeting would take up far too much space and time. There are, however, a few points that are of urgent importance at this present moment, and these may be, nay, must be, treated at once, leaving the other matters for subsequent discussion. The main points, we take it, are these—

What shall be done at Chiswick? Shall all the fortnightly meetings be held there during the summer, or shall those meetings be confined, as they were with one or two exceptions this year, to the Drill Hall?

Our own notions as to what should be done at Chiswick are, briefly, that it should be made more fully and completely an experimental garden and trial ground than it already is. There is no need to grow there what may be seen in any nursery, in any florist's shop, or on any green-grocer's stall; but there is need to grow there novelties for trial, or old things for comparison. Selections of subjects in all departments chosen with a view of testing their applicability to various horticultural purposes should be cultivated. Standard collections of the best flowers, fruits, and vegetables should be maintained for the purpose of reference, and the establishment of correct nomenclature.

Scientific experiments, too, as far as can be done, should be carried out—not such experiments as bear wholly on abstract science—the laboratory and grounds at Kew are the fit places for such investigation—but experiments that have a direct bearing on practical horticulture. Among these may be mentioned, by way of illustration, hybridisation, and cross-breeding; methods of pruning, the use of manures, the selection of stocks for grafting. These and like matters should be carried on at Chiswick as far as means will allow, as systematically as so many experiments in the laboratory, and recorded as accurately.

Before leaving the subject of what should be done at Chiswick, we desire especially to call attention to the important letter of Mr. DYER in another column. We do not wish to make any comment on his letter further than to express our substantial agreement with his views, and to point out that, although the letter is written by the Director of the Royal Gardens, Kew, and although he speaks of Chiswick as the Kew of Horticulture, we do not understand him to mean that Chiswick is to be made a department of Kew. Mr. DYER merely asserts that Chiswick should be to horticulture what Kew is to botany. We may indeed look forward to the establishment of a training school at Chiswick, which might be worked in conjunction with Kew, Chiswick students having the privilege of attending the lectures, &c., at Kew, and Kew employés being allowed to pass a certain time in the fruit-houses and vegetable-quarters at Chiswick; thus each might supply what the other lacks. The consideration of this project, however, must be deferred. Sufficient for the moment is the work we have in hand.

Having stated in outline what, in our opinion, should be done at Chiswick, we have next to consider whether any, or all, or none, of the fortnightly meetings shall be held at Chiswick during the next summer. And here it is necessary for a moment to recall the circumstances of the case. In the early part of this year the Committee appointed by the Fellows selected as an appropriate meeting-place for the Society in its then urgent need, the offices in Victoria Street as a fit place for the Lindley Library, for the Council meetings, and for the transaction of the ordinary business of the Society. Of the fitness of the choice made by the Fellows' Committee, and recommended by them for adoption, we have heard no two opinions. The room is well situated, convenient, and the library is housed as it has never been before—it is arranged, catalogued, and available for use.

As to the Drill Hall, that also was selected by the Committee, and there is no doubt that in

many respects it is eminently suitable and convenient; but it has some disadvantages, and the Fellows and general public have not hitherto taken to it very kindly. Under these circumstances it has become a question whether the Drill Hall shall be abandoned, as it can readily be, and the fortnightly meetings held at Chiswick, in accordance with the spirit of the resolution so warmly supported at the Apple Conference. To this latter course objections are raised: it is said that the exhibitors would not come, the committees would not come, the public would not come. Of course there is some force in all these objections, but none of them is fatal, for none is absolute. We believe, on the contrary, that if it could be arranged for some (not all) meetings to be held in the course of the summer at Chiswick, that exhibitors would come, that the committees would come, and that the public would come. This latter contingency of course depends on the adequacy of the announcements made. Meanwhile it must not be forgotten that Chiswick is the centre of a vast garden-loving population. Such meetings might be held alternately with similar gatherings in the Drill Hall, while the Temple Gardens, the Crystal Palace, and other places, might be made available for the "big shows," where the requirements of exhibitors would be specially considered. During the three or four winter months, the room in Victoria Street would probably suffice for the committee meetings.

These are the matters to be discussed on Tuesday next, and with Chiswick trembling in the balance, we repeat the expression of our hopes that the Fellows will consider it a duty to attend. If they vote straight for the proper development and utilisation of Chiswick, all the better—according to our thinking—otherwise the Society will be more than ever a certificate factory, and a society for the holding of flower-shows—both things desirable in their way, but both together totally inadequate, as fulfilments of what are set forth as the aims and duties of the Society.

The Chrysanthemums.

At this season what should we do without the Chrysanthemum?

This is a question that any one who visited the great show at the Aquarium at Westminster may well ask? The display was indeed, remarkable, and having seen it, there is no room for surprise at the great popularity the flower enjoys. From this point of view, indeed, it runs the Rose hard. And when we consider that the Rose comes in the full tide of the flower-season, while the "mum" comes at a time when it has, of necessity, the field to itself there is the less reason to wonder at the enthusiasm the flower excites. In form and in colour it has something to satisfy all tastes, and this at the very dull season of the year. Another question we feel disposed to ask is—Where should we be without the "Japs"? The formal meaningless globes and incurved varieties, as inelegant in shape, but as brilliant in colour, as show Dahlias, are more than balanced by the tassels, and rays, and quills, and fringes of other sections; so that if one object to the formality and want of significance of the one, there is plenty in the abandon and suggestiveness of the other to satisfy the veriest stickler for Nature *versus* Art in the floral world.

The Anemone-flowered section holds the mean between the two; and while their form satisfies the demands of the most exacting there is enough to supply the requirements of those who, consciously or un-

FIG. 78.—*NEPENTHES DICKSONIANA* X: PITCHER APPLE-GREEN, SPOTTED WITH CRIMSON, (SEE P. 543.)

consciously, love to see in a flower some manifestation of its origin and history, some expression of its adaptation to circumstances and to the purposes it is adapted to fulfill. Abstract beauty is one thing, and men will differ very materially as to what it is, and of what elements it is constituted, but beauty of appropriateness and adaptation is another matter, and one that all can appreciate. To those who know what a flower is, what it has been, why it is as we now see it, and what may fairly be expected of it in the future, the interest is enhanced tenfold. A flower that may be successfully imitated in wax or paper is not much of a flower after all. It has the same relation to other flowers as the wax models at Madame Tussaud's to the living men. But all this, as we have said, is very much a matter of taste and individual appreciation, and the National Chrysanthemum Society shows its wisdom in catering for all.

The details of this great show are given in another column; here we can only express our general impression that the cut flowers were superb, while the groups were not so fine as we have seen them on former occasions. The season, no doubt, has much to answer for in this particular. Many growers were surprised by the sudden severe frosts in the early part of October, and the effects of this are visible in the bare leafless stalks, and in some cases by the crippled flowers. These latter were, of course, not noticeable in the exhibition room, but they are evident enough in the collections of the growers, and they go far to emphasise the fact that the Chrysanthemum is not quite hardy, and that the cultivator must be wary and get his plants under cover in due season.

As far as novelties are concerned the French are inundating us with flowers, which differ from what we have already as tweekle-dum from tweekle-dee, but our American cousins are sending us plants of a distinct and valuable character so far as regards robustness of habit and dwarf stature. These are desirable qualities, for, however beautiful and extraordinary cut blooms may be, the like flowers seen like mops at the top of a long stem are not quite so attractive. Another point is worth notice, and that is the foliage. The leaves of a Chrysanthemum are distinct and handsome in appearance; moreover, they are exceedingly variable, and this is the more interesting, in that it is a natural variation, which has not been (consciously at least) selected by the florist. The philosophers should take heed of this, they attribute the variation in the flowers to the processes of selection and protection exercised by the gardener, or, in Nature by insects or otherwise, but there is nearly as much variation, though no one has observed it systematically, in the foliage; and this, as we have said, has not been selected by the florist. To what, then, is this variation attributable? Verily there are many things not dreamt of in our philosophy!

**ROYAL HORTICULTURAL SOCIETY.**—"A special meeting of the Council was held on Wednesday, October 31, at 1 p.m., when it was resolved that a cordial vote of thanks be sent to all those who were kind enough to read papers, or to exhibit fruit, or in any other way to assist in making the late Apple and Pear Conference at Chiswick a success. It was resolved that a report of the Conference be forthwith prepared with a view to its publication as a number of the *Journal* of the Society. The two resolutions passed at the Chiswick Conference were then read and considered, and with reference to the suggested Sub-Committee on Law and Parliamentary Matters, it was resolved, "That the Government having, at the suggestion of the Council of the Royal Horticultural Society and others, expressly

included horticulture in the bill for the establishment of a ministry of agriculture, it would be unadvisable to appoint a separate Law and Parliamentary Committee, the Council considering itself to be in a position to fulfil the duties of such proposed committee more advantageously than a subsidiary body." With reference to the second Conference resolution, relating to the Society's garden at Chiswick, the following resolution was passed, viz.:—"That the Council of the Royal Horticultural Society fully appreciate the value attaching to Chiswick Garden, and are anxious to extend and develop its resources to the greatest possible extent in every direction for the advancement of horticulture, as far as the means placed in their hands will allow." It was resolved to invite the members of the present Fruit and Floral Committees, and, also the principal exhibitors, to attend a meeting in the Council-room on Tuesday, November 13, at 11:30 a.m., to discuss as to the best place in which to hold the fortnightly meetings for 1889. It was further resolved to hold a general meeting of the Fellows of the Society in the Council-room on Tuesday, November 13, at 2 p.m., in order to submit to them the draft of new bye-laws with a view to their adoption. It was determined that at the two next meetings of the Society on November 13 and December 11, any tender plant may be placed in the Council-room where they will be free from exposure to cold. By kind permission of the Treasurer and Benchers, a grand flower show will be held by the Royal Horticultural Society, in the Inner Temple Gardens, on May 30 and 31, 1889. It was resolved to contribute £10 to the funds of both the Auricula and Carnation Societies, if their exhibitions are held under the auspice of the Royal Horticultural Society in the year 1889."

**NATIONAL AURICULA SOCIETY (SOUTHERN SECTION), NATIONAL CARNATION AND PICOTE SOCIETY (SOUTHERN SECTION).**—We have received the following disclaimer from Mr. J. DOUGLAS, Barking-side, Ilford, for publication:—"The annual general meetings of the above Societies were held on October 23, and inaccurate reports of these meetings were sent to the gardening papers. In certain papers articles have been written founded upon these erroneous paragraphs, and I, as Honorary Secretary of the above Societies, beg to say that not a line was either written or prompted by me concerning the meeting. The inaccuracies I complain of are—first, the statement that it had been decided to hold the annual displays at the Crystal Palace; whereas nothing of the kind was decided at the meetings. The Societies are also termed 'national societies,' but, to be correct, the meetings were of the 'southern sections' only. As some of the criticisms are adverse, it is only fair to the Northern Sections to say that they are not included. I decidedly object to the publications of the proceedings of any societies such as have appeared in the gardening papers, even when they are not inaccurate. It was decided at the meeting this year, as it was also last year, to communicate with the Directors of the Crystal Palace to ascertain on what terms they would receive the Societies, and at the same time it was decided that a similar application should be made to the Council of the Royal Horticultural Society. I thought it best while negotiations were pending to make no public statement, but other persons evidently differed from me in this respect; but when it had been finally decided where the exhibitions would be held, I should have sent the usual report to the gardening Press."

**MINA LOBATA**, or, more properly, according to Benthams and Hooker, *Ipomœa versicolor*. The specific name of this beautiful climbing plant is very applicable to shades of colour that the flowers pass through. It is considered by some to be rather tender, but it stands in the open at Cambridge, growing and flowering profusely. Seeds should be sown in February or March in heat, and grown on singly in pots with a small stake, hardening them off, and finally planting them out into the border or elsewhere. When

planted in the open a few twiggy branches are very suitable for them to trail over.

**BERTOLONIA COMTE DE KERCHOVE.**—This is one of Mr. BLEU's seedlings, with cordate ovate acute leaves, with an olive-green velvety ground traversed by brilliant rose-coloured nerves. It was exhibited with others at the last Ghent Quinquennial, where they naturally excited great admiration. The plant is now figured in the November number of the *Revue de l'Horticulture Belge*.

**BOTANICAL DEPARTMENT, NATURAL HISTORY MUSEUM.**—Mr. ALFRED REIDLE has been appointed Assistant in the Department of Botany in place of Mr. RIDGEY, who has been chosen as Superintendent of the Botanical Department, Singapore.

**"FAMILIAR TREES."**—This work, published by Messrs. Cassell, continues to merit praise, both for the information it contains and the way in which the numbers are got up. The paper, print, &c., are good, and there are pretty and numerous illustrations. The value of the coloured plates (which are issued every month), is enhanced by the fact that the German and French synonyms of the trees figured are given, in addition to the English names. Mr. BOULEZ, the Editor, knows how to combine accuracy of statement with facility of exposition.

**MANCHESTER HORTICULTURAL IMPROVEMENT SOCIETY.**—The first meeting of the present winter session of the Manchester Horticultural Improvement Society was held on Thursday evening, October 31, at the Prince's Café, Oxford Street. Mr. BRUCE FINDLAY, the retiring President, in the chair. Mr. R. TAIT, Treasurer, submitted his annual statement of accounts, which showed a balance in hand of about £5. The balance was, he said, not a large one, but they must remember that the subscription fee was only a small one. The President addressed a few words of encouragement, and the Honorary Secretary (Mr. W. B. UPHORN) congratulated the members on the prospect of a pleasant session. Papers had been promised by Mr. Gleeson on the Pine-apple, Mr. McKeller on vegetables, Mr. R. Plant on the Horse-radish, Mr. J. Booth on "Modern Gardeners and Gardening," Mr. Birkenhead on "The Functions of Leaves under the Influence of Sunlight," Mr. R. Tait, jun., on "Liliums and Cyclamens," Mr. W. Elkin on "Floral Decorative Work," Mr. Wallace Adams on "The Mixed Border," and Mr. Samuel Barlow on "Garden Gossip." The following were elected officers for the ensuing year:—President, Mr. Bruce Findlay; Vice-President, Mr. A. Stansfield; Treasurer, Mr. R. Tait; and Honorary Secretary, Mr. W. B. Upjohn. Messrs. J. Bridson, W. Elkin, G. Lunt, W. Plant, and F. Robinson, were elected members of the committee.

Mr. D. T. FISH has been elected member of the Town Council of the town of Bury St. Edmunds.

**ROYAL HORTICULTURAL SOCIETY OF ABERDEEN.**—At a recent meeting of the acting directors of this Society Mr. JAMES MURRAY GARDEN, Advocate, Aberdeen, was appointed chairman, and Mr. ALEXANDER ROBINSON (of Messrs. W. SMITH & SON Vice-Chairman. The annual supper was fixed for Friday, December 14. It was unanimously agreed that an illuminated address be presented to Councilor Lyon, late Chairman of the Society, thanking him for the warm interest he has taken in the welfare of the Society. It was resolved to have another meeting soon to prepare a prize schedule for 1889.

**FRINGED CYCLAMEN.**—Mr. COOPER sends us from the garden of the Right Hon. J. CRAMERBRAIN the finest specimen we have yet seen of this curious and beautiful anomaly already figured by us. From the inner surface of each petal arises, not one single petalline lobe, but a whole tuft of them. The five stamens are opposite to the petals. The whole

flower is bell-shaped, the individual petals not being reflexed as usual. It was raised from seed of a flower like that figured, and is a distinct advance on it.

**ROYAL MICROSCOPICAL SOCIETY.**—The next meeting of the Society will be held on Wednesday, the 14th inst., at 8 o'clock precisely, when the following paper will be read by Mr. W. W. West:—"List of Desmids from Massachusetts, U.S.A."

**PHOENIX DACTYLIFERA.**—A large female specimen of this, the Date Palm, has been sent to the Royal Garden, Kew, from the Cambridge Botanic Garden. The plant has been growing in a box in the Palm-house, and when packed in its case measured 35 feet in length, weighing upwards of  $\frac{1}{2}$  tons. It arrived safely at its new home by rail, and has been planted out in that fine and large conservatory in the pleasure-grounds known as the Temperate-house.

**LARGE ORCHID SALE IN AMERICA.**—The largest and finest collection of Orchids ever offered at a public sale in America by a nurseryman or dealer was (we quote from *Garden and Forest*, of New York), disposed of by auction, at the rooms of YOUNG & ELLIOTT, of that city, on Tuesday of last week. The sale included the entire stock which Messrs. F. SANDER & Co., of St. Albans, England, had collected at their establishment in Jersey City, and consisted of more than 1000 lots. The total amount realised was about 7000 dollars, and it would have been considerably more if the sale had been concluded. The day was too short, however, and some 200 of the lots catalogued were not reached. As a rule satisfactory prices were obtained, but some of the very finest Orchids sold for less than their real value. This was true of the superb specimen of *Vanda Sanderiana*, which brought only 230 dollars. The original plant of *Cypripedium boxallii* atratum, which was certificated by the Royal Horticultural Society of England, sold for 160 dollars; *Cypripedium Chantini*, Philbrick's variety, brought 160 dollars; and a wonderful specimen of *Cattleya Mossii* sold for 145 dollars. Perhaps the *Cypripediums*, all things considered, were sold to the best advantage. It was noted that the bidding was quite as brisk when darkness put an end to the sale as it was at the beginning. It was noted, too, that a larger proportion of plants than is usually the case went to the trade about New York and Philadelphia, showing a confidence on the part of alert dealers that the demand for Orchids, and the best Orchids, is steadily growing in this country.

**MUSSAENDA BORBONICA.**—An interesting communication has recently been made to the Société d'Acclimatation of Paris by M. LAPEYRE, a health officer of the French Navy, concerning a shrub, previously undescribed, belonging to the order Rubiaceae, and found on the island of Reunion. It forms a bush of 9 feet in height, with a short stem, and numerous branches. The berries are round, slightly pressed together at the points, of the size of a Cherry, and of a blue-green colour, changing to violet when ripe. They contain two seeds, in form resembling those of Coffee, and showing still closer resemblance in chemical composition. According to the analyses made, *Mussaenda* seed contains caffeine, an aromatic essence, ether, oil, and the other substances in greater or lesser proportions which are found in Coffee. They offer, therefore, a good substitute for the latter, or of Chicory, sweet Acorns, and other substances generally mixed with Coffee. It is stated that of *Mussaenda* seeds 3,000,000 kilogrammes can be obtained annually. It will be remembered that *Mussaenda* is a near ally of the Coffee.

**CASSELL'S "POPULAR EDUCATOR."**—We have received the first part of the new edition of CASSELL'S *Popular Educator*. The monthly numbers of this useful work are issued in a more convenient size than before, and contain much new matter; the old articles have been revised and brought up to date. The subjects treated of include science, art, and

languages, and there are besides instructive and interesting essays on more general subjects. To the practical utility of this work we can ourselves testify, having found the first edition a valuable aid when as an amateur teaching languages and certain sciences to a class of artisan students; hence we can strongly recommend its use in garden libraries. The botanical portion, however, in the former editions was inferior and much behind the age. We trust this may be rectified in the new edition.

**THE APPLE AUDIT.**—Some results of the late Chiswick Conference will be specially interesting. The object was to ascertain not how many sorts are in cultivation, but which are the best suited commercially for special purposes in different localities. The double audit taken shows, first, by the number of dishes exhibited, what is the popular verdict; and the second, by the number of certificates awarded, the merits of the particular variety as shown on that occasion from various localities. Thus, Warner's King was exhibited by seventy-eight exhibitors, and received ten certificates, a percentage considerably less than Peasgood's Nonsuch. Here are a few figures relating to the most important kinds:—

	Dishes exhibited.	Certificates awarded.	Per cent.
<i>Apples.</i>			
Warner's King ... ..	78	10	12
Cox's Orange ... ..	64	8	12
Lord Suffield ... ..	56	6	11
Stirling Castle ... ..	53	6	11
Cellini ... ..	52	5	10
Peasgood's Nonsuch ... ..	52	5	10
Ribston ... ..	54	5	9
Worcester Pearmain ... ..	41	5	12
<i>Pears.</i>			
Louise Bonne de Jersey ... ..	55	13	25

**LINNEAN SOCIETY.**—A meeting will be held on Thursday, November 15, at 8 p.m., when the following papers will be read:—1. "On the Mountain Range of Flowering Plants, and Ferns, in Ireland." By Mr. H. C. HART, F.L.S. 2. "On the Mammals collected by Mr. H. N. RIDLEY in Fernando Noronha." By Mr. OLDFIELD THOMAS. 3. "On the Birds collected by Mr. H. N. RIDLEY in Fernando Noronha." By Mr. R. BOWLER SHARPE, F.L.S.

**"DIE NATURLICHEN PFLANZENFAMILIEN."**—The last number of this useful publication contains the commencement of Dr. PRITZER'S Monograph of Orchids.

**DAHLIAS FROM ROTHESAY, N.B.**—We have received from Messrs. DONBIE & Co., of Rothsay, blooms of Dahlias, show, Cactus, and pompon, gathered in their nursery on November 5. They show the extreme mildness of the weather there during the past month. The flowers were gathered from their Dahlia grounds, which they tell us are still gay and brilliant, and the plants showing hardly a trace of injury from frost. The lighter coloured varieties seem to have lasted best. Queen of the Belgians and Mrs. Gladstone, are but little inferior to the best blooms of the season. Mrs. Hawkins (Cactus), J. Green, and Ethel Britton are also very good.

**M. DE CANNAROT D'HAMALE.**—The death of this veteran Belgian horticulturist, so well known to many of our fraternity, is announced. M. DE CANNAROT was indeed a familiar figure at all the principal horticultural meetings. He was a member of the Belgian Senate, learned, genial, and enthusiastic, and died full of years at Malines on the 2nd ult., having been born in 1803. Together with our much-lamented friend MORREX, and in asso-

ciation with some still left to us, M. DE CANNAROT was a leading spirit in the management of the Federation of the Belgian horticultural societies. He was the author of a monograph on Lilies, and his collections of living plants at Malines were well known.

**SIR JOSEPH HOOKER.**—The portrait of Sir JOSEPH HOOKER, intended for presentation to the Linnean Society, is to be painted by Mr. HENKOW, the death of Mr. FRANK HOLT having prevented the realisation of the original plan.

**JUGLANS MANCHURICA**, which was recently figured in our columns (see p. 334), is a most promising nut tree from Japan. A tree in the Arnold Arboretum, from seed planted in the fall of 1879, has this year, says *Garden and Forest*, borne two bushels of nuts. The fruit is larger, more nearly spherical and less rough than our common Butternut and is of very good flavour. The nuts are borne in clusters with from six to thirteen together. The tree has borne now for five years, and, besides the valuable crop it yields, it gives good promise as an ornamental tree.

**RHEUM NOBILE.**—A fine crop of seedlings has been raised from seed saved from the plant that flowered in the Royal Botanic Gardens, Edinburgh, this summer.

## NEPENTHES DICKSONIANA ×.

This is a very distinct, and, as our illustration will show, a very beautiful variety. Its origin is curious. Whether it would ever have originated in Borneo, Sumatra, Singapore, or adjacent islands, we do not know. Possibly it might do. But in this country, at least, without the aid of railways and post-offices, it could hardly have done so. Stage-coaches might have been rendered available, perhaps, but at the date of stage-coaches one, at least, of the parents was unknown in this country. In fact, the plant before us is the offspring of *Nepenthes Rafflesiana* as flowering in the Edinburgh Botanic Garden by the pollen of *N. Veitchii*, as supplied from the nurseries of Messrs. Veitch at Chelsea. Mr. Lindsay, the Curator of the Royal Botanic Garden, effected the cross, raised the seedlings, and desired that they might bear the name of Professor Dickson, the late Professor of Botany in the University, who took much interest in this class of plants. The hybrid in question is now some three or four years old, and at first it gave so little promise of the beauty it has since evolved, that there were, we believe, serious doubts as to whether it was worth preserving. Some one (may his name be blessed!) pleaded for it, and the result is now before us in the shape of the handsome pitcher plant illustrated from Messrs. Veitch's specimen, at fig. 78.

*N. Rafflesiana* is known as one of the earliest introductions of the kind, and is still one of the handsomest of its race. *N. Veitchii* is remarkable as one of the most distinct of the genus in the yellowish colour of its pitchers, and in the very broad flatish frill which surrounds the mouth. In the hybrid we have the characters of both species curiously intermingled. We were about to give these points in detail, but perhaps few of our readers would thank us for so doing. Suffice it to refer to our illustration, adding, what is not there shown, that the leathery deep green leaves are about 20 inches long, tapering at the base into a channelled stalk, 4–5 inches long. There are three parallel nerves between the midrib and the margin, which are not shown in our illustration, but which should be noted because that way lies the means of discrimination between many of the species. The colour of the pitcher is a pale green, thickly mottled with crimson blotches; the rim is very broad (1 inch), not so flat as in *Veitchii*, but more so than in *Rafflesiana*, finely ribbed, and some of the ribs striped with purple. The lid is oblong, pilose on the outer surface, purple-spotted within, markedly two-ribbed, and with a long horn-like spur at its base. The wings of the pitcher

are deep, with long fringe-like cilia at the edges, and they reach from end to end of the pitcher.

The plant is evidently of vigorous habit, "free," and likely to increase in beauty with age. For the rest, see our figure, or, better still, pay a visit to Messrs. Veitch's Nephentes-house, preparing yourself beforehand (if you have not been there before) for a startling surprise, and a sight as full of interest as it is of beauty.

## CHRYSANTHEMUMS.

THERE will probably be observable in the shows just commenced a great range in the quality of the blooms staged, and close round London the quality of the blooms will have been affected by the frosts on October 3 and succeeding nights, although closer in again the damage is not so apparent. Then the cold damp sunless season has had the effect in many cases of causing damping in the blooms. Nevertheless, we can confidently look for some first-rate flowers, and the exhibits will be generally either very good or bad, and only in a few cases of medium quality.

MR. OWEN'S, MAIDENHEAD.

At Mr. Owen's nurseries, Maidenhead, the effects of the frosts are very distressing, whole rows containing hundreds of plants being rendered useless, and there are included in these several of the very latest varieties, and therefore a distinct public loss is occasioned, for Mr. Owen procures almost every new variety each season, and gives opportunities for comparing their merits. There are, however, some few plants which have fared better, and besides the very well known varieties we may single out G. Daniels (new this season), a reflexed Japanese, almost white above, with rose-pink reverse; it is of large size, and in all probability will be a favourite when better known; the petals are large, about half an inch wide, but are rather sappy, which may be attributed to the season. Another Japanese is Fimbriatum, bluish, with white lacerated tips—a pretty flower, which is now two years old; it bears very large blooms, one measuring 10 inches across. Miss Gordon, reflexed Japanese, is a rich pale pink, and has good-sized petals. Gorgeous, a fine solid chrome-yellow flower, after the style of Thunberg. Avalanche shows up well as a pure white Japanese; it is a light looking flower, rather short in the petal. Elsie is creamy-white when fully expanded, but lemon coloured on opening; the petals are very drooping, and it is a good reflexed Japanese variety, of medium size. Alcyon, another of the same section, rose-coloured, has recurved tips, which display a lighter tint of the same colour. Florence Percy (Japanese) has tubular and spatulated long white petals, giving an appearance of lightness and airiness which is very pleasing. Duke of Berwick, a Japanese, cream-coloured, with faint rose traces, is to be noticed as a dwarf and early variety.

One of last year's varieties, which is striking, is Marie Ouvray, a deep red maroon, fluted and twisted; it is a free flowerer, but is too small for exhibition purposes. Jules Barigny, a rose-coloured Japanese flower, white reverse, has no centre, but is a pretty colour and a good decorative variety. Holborn Beauty is a Japanese, with petals of good breadth, yellow, and a strong grower. M. Duboul is bright rose with a paler centre; the petals have an irregular twist, and are drawn in to narrow points, making a very conspicuous bloom. Sarah Owen, W. Holmes, and Lincoln's Inn are well grown, and also Cupicine for decorative purposes.

Among the incurved, M. le Baron d'Avenue must be named; it is quite new, and in colour is rosy-lilac, tipped with white; also George Anderson, rosy-lilac, and white striations—a pretty combination; and an American novelty, E. S. Renwick, soft pink on both surfaces—a promising flower. There is also Jubilee, a pale pink, stated to be a sport from Princess of Teck. A deep rich and bright yellow show Anemone is J. Thorpe, Jun., which has a good-sized flower with a good number of ray petals.

Before leaving the nursery reference should be

made to the Chrysanthemum coronarium Cloth of Gold, a strong variety, with flowers of bright yellow, measuring 3 inches in diameter.

THE ROYAL NURSERIES, SLOUGH.

Mr. C. Turner was also unfortunate in feeling the frost, but not to such an extent as at Maidenhead. Large quantities of Boule de Neige, Princess of Teck, and Mrs. N. Davis, suffered most, and after being frosted the plants were taken inside, being previously cut-back till the pith became white; they are breaking away now, but what will follow? There was a fine lot of bright blooms in the house, the best varieties in each section being represented by large and clean blooms:—these included such varieties as Madame Blanche Pigny, W. Holmes, J. Mahood, Lord Alcester, Cullingfordi, Comte de Germiny, Madame de Sévin, Mdlle. Lacroix, Val d'Andorre, &c. Besides these, there were novelties worthy of special mention, such were:—Madame Barez (Japanese), short petals of rosy-purple, very closely lined on a whitish-yellow ground, the colouring being more intense at the tips of the petals, it is a promising variety, and is stated to be early. Monsieur L. Langlois, tubular and spatulate, petals of coppery-lilac and red-brown, a pleasing colour; Amy Furze, white, splashed rosy-purple, short in the petal (Japanese). Another pretty Japanese is M. Levigne, pale pink on white, with the petals long and twisted. Madame Louise Lacroix, pure pearly-white (also Japanese), is a flat flower, adapting it well for wreath work. Carew Underwood, the bronze sport from Baronne de Prailly, was well represented. In one house were very large quantities of Lady Selbourne and G. Glenn, which are grown for cutting purposes. We noticed also the early Neapolitan Violet, Lady H. Campbell, which was in full flower. It is earlier than Marie Louise, and is of a slightly lighter colour. Mention may also be made of a pyramid tree of Crataegus Lalandei in full berry—a pretty and conspicuous object.

MR. W. HOLMES, FRAMPTON PARK NURSERY,

Hackney, has a good display of blooms in a house erected for the purpose. Marguerite (Japanese), cream coloured, with purple-carmine at the base, is a very distinct flower. It is new, and will probably develop into a capital flower. Tisiphone, another Japanese, has fine hair-like petals of gold and red-brown with the petal very much twisted. It is a flower about which opinions are likely to differ widely. Mandarin is a great acquisition to the Japanese section, being a full flower of fluted petals, and in colour a delicate cream. Triomphante, a reflexed Japanese, with broad petals of lilac-pink, with a cream centre, is a solid-looking flower. Marquis of Devonshire, the sport from Bouquet Fait, which, when seen last year, was considered to be like William Robinson, is evidently distinct as seen here; the colour is a warm terra-cotta. Others were Sunflower, a beautiful yellow, certificated this year by the Royal Horticultural Society; Avalanche, pure white; Madame Ch. Souchet, bright yellow and Carter pink, like O. J. Quintus, but of larger size, all Japanese; and Nielson, the largest Japanese Anemone. There were also several splendid blooms of W. Holmes.

FINSBURY PARK.

The usual annual exhibition at Finsbury Park is now open to the public, and a capital display of blooms of fine quality may be seen there in a house 100x18 feet, with the plants arranged in a double sloping mass; in the centre E. Molyneux, Mons. Tarin, Madame de Sévin, Thunberg, Lord Alcester, Mrs. Rundle, Mons. Delaux, G. Glenn, W. Holmes are prominent; and also Samuel Morley, rich red-brown (reflexed Japanese); Romeo, magenta-brown (fluted Japanese); Mr. J. Laing, bright red-brown, with a gold margin, the petals attaining a fine point (reflexed Japanese); Lady Lawrence, a new large white Japanese with broad petals, likely to be a good flower; Dr. Dor (Japanese), deep cream, with just a very faint suspicion of rose—a very attractive variety; and Gorgeous (reflexed Japanese), bright

yellow, were very good. Mr. Maudlin, under whose charge the plants have been grown, is to be congratulated on the display.

MESSRS. J. VEITCH & SONS, CHELSEA.

A large houseful of new and old varieties reward the visitor at this establishment. Here also the early frosts have left their mark in the shape of crippled bloom-buds; and the fogs have disfigured the foliage, which, at an early period of the autumn, was very healthy-looking and abundant. The new varieties were chiefly placed in the Camellia corridor—at least the earliest in bloom were so placed. These were Madame J. Laing, a fine chestnut-coloured Japanese, with thread-florets reflexed; Belle Pauline, of the same class, lilac, with long thread-florets; William Stevens, orange and lemon-yellow—a good flower, and large Charles Gibson, an orange sport from Princess of Teck, in form equalling the original flower; E. Molyneux, crimson-brown (Japanese), with the reverse of the floret of dead gold colour, a showy fine bloom; Anne Clarke (Japanese), the thread-like flower, divided at the tip, centre of flower white, the margin, lilac-coloured; J. J. Hillier is very similar to Madame J. Laing, but it is later in flowering, and the chestnut colour has a shade of crimson in it; Moonlight is a full white flower with divided florets, which are twisted; Charlotte de Montcabrur is delicate mauve-coloured, full, and with thread-like florets; L'Or de Japon is a fine thing in deep yellow, the points of the florets turn up; C. Orchard is a crimson-orange, with the reverse of the florets dead yellow: the flower is very full. Other good varieties were Alfred Chantrier, yellow, with a pink suffusion over the straight florets; it is an early flowerer. W. Holmes, rich crimson-brown—a fine globular bloom; The Moor, one of Mr. Sadler's seedlings, a reflexed Japanese, close-petalled, small flower, and nearly the same colour as the last named; it may come yet finer than now seen. The American-raised flowers are Mabel Douglas, a medium-sized flower, reflexed, soft yellow, thread florets—a pretty Japanese variety; Puritan, a pure white flower, with flat florets turning upwards, large—a fine flower; Mrs. Langtry, a very large, starry, white Japanese; and President Hyde, a reflexed yellow, with a button-like centre, dwarf in habit, as are most of the American varieties.

## ATHROTAXIS SELAGINOIDES.

THE species of these curious Tasmanian Conifers are sadly confused in gardens, but we trust that the figures and descriptions of the species which have been given in these columns from time to time may aid in their more ready discrimination, and in the establishment of correct nomenclature. The present species is widely different from the others, and may be recognised by its loosely packed relatively large curved linear-lanceolate leaves and cones of the size of a Cherry.

For the specimen from which our fig. 79 was taken we are indebted to the kindness of the Director of the Royal Botanic Garden, Glasnevin. We have seen it in various gardens under the name of Gun-niana and Doniana, but the name adopted is the correct one. The three species are very easily recognised:—

A. cupressoides has relatively small, closely appressed, ovate leaves, with a prominent midrib, and the cone-bearing branches sharply bent downwards at the apex, so that the cones, which are about the size of a large pea, are nodding. It is usually, but erroneously, called A. selaginoides, and we have also seen it under the name of C. imbricata. It was originally described by Don, and subsequently by Sir Joseph Hooker in *The Flora of Tasmania*. It was figured also in these columns, 1885, vol. xxiv. p. 273.

A. laxifolia has the same general habit, but the leaves are loosely packed—not at all appressed—and oblong obtuse leaves, longer than those of E. cupressoides. The cones also are not bent downwards, and are larger, being of the size of a small Cherry. The species was originally described by

Sir Joseph Hooker in the *Icones Plantarum*, and was figured by us on November 7, 1885.

A. selaginoides curiously resembles *Lycopodium Selago* in appearance. Its leaves are loosely disposed, about half an inch in length, narrowly lanceolate acute, and the cones are as large as a Cherry (see fig. 78). In each case the seeds are provided with rather deep oblong obtuse wings. The microscopical structure of the leaf and other characters have been given in previous numbers, to which we may refer the reader. They are trees for the gardens of the plant lover and connoisseur, but not likely to be of value for timber.

## HOME CORRESPONDENCE.

**WALL TREE BORDERS.**—Fruit and its profitable cultivation are in the ascendant, and certainly "hold the field" in every gardening periodical. Among others I beg to submit my ideas in regard to the cultivation of fruit trees on walls. From time immemorial the general custom has been to make a border for the roots of from 10 to 12, or 14 feet wide; and every year this land is in great measure manured and dug, often twice, for the production of all kinds of vegetables. Now, as it is considered a barbarous practice to dig among our trees and shrubs, cutting and mutilating the roots, surely it must be equally so to do it to our fruit trees on the walls. My experience leads me to think that if it were otherwise there would be fewer dead branches and less gumming, especially on Apricots, Cherries, and Peaches. I have seen splendid crops, in a garden in the west, of Apricots, Cherries, and Grapes when the trees were planted under the roadway or path. Now, my system would be this—to have a narrow border 3 or 4 feet from the wall, then a broad walk 6 or 7 feet wide, well made with brick-rubble and old mortar for the foundation well rammed. I have no doubt myself of what the result would be. *A. J. Temple, Nostell Priory, Wakefield.*

**STANHOPEA SACCATA.**—I would wish to add to the list of interesting and beautiful Stanhopeas mentioned at p. 480 by Mr. Douglas as growing at Lowlands, Mr. Horner's residence, the name of one quite worthy of being added to any collection where these curious and beautiful Orchids are grown. This is *S. saccata*. I have twice flowered this species, which bears compact blooms of medium size of a clear shaded primrose-yellow colour, the lip having a remarkable bag or pouch of brilliant orange colour, whence its name, which has the authority of Professor Reichenbach, is derived. I find that it thrives in a basket hung close to the roof in the stove. Any grower of Stanhopeas will be well to secure this beautiful species. *J. T. Poc, Riverston.*

**PLANTING SANDHILLS.**—I have noted with some interest the correspondence on the above subject, and I am sure that, generally speaking, one point is overlooked by many planters, and that is the fact that although grasses have succeeded in holding the sand, it yet takes some years before such sands become converted into soil sufficiently good to support the free growth of other plants, and unless means are taken to provide the necessary pabulum for the growth of trees, &c., time must be allowed for natural causes to provide the material for such growth. To expect plants to grow freely where they can obtain no real nourishment is not a sensible thing, and therefore some method must be adopted to secure the end in view. In the natural course of events, if we have grass which is suitable for the food of animals, they could be grazed on the sandhills, and by adding such things as corn or oilcake to their dietary, the soil would be enriched, and a greater quantity of forage would be produced, while the enrichment of the newly-forming soil would in time give facility for the employment of a wider variety of forage plants, which again would tend to make the pasturage more valuable, and while making it more valuable, would be also rendering it increasingly more suitable to the growth of plants of larger growth. Time would of course be necessary, and this is just what is not allowed as a rule, and therefore after the sands are once bound, some method of enriching them other than by natural causes must be adopted. In the artificial enrichment of the soil, dressings of clay, river mud, and other heavy materials may be used if obtainable, as well as thoroughly-

rotted seaweed, animal matter of all kinds, and in fact anything which will tend to bind and enrich the sand; while deep-rooting plants, such as Seakale, may be used in moderation on the bound sands, all these items being serviceable in forming a soil in which trees will grow. However, before having large trees, bushes of Tamarisk or other subjects should be planted to afford some break or shelter for the trees; and these latter should not be too large specimens when first set out. Time and perseverance are the chief things in reclaiming sands, and given these, the work of reclamation will proceed vigorously after the sands are once rendered stable and free from shifting by the initial process of binding with grass and other plants. *Walter J. May, Walton-on-Thames.*

**PRESERVING MELONS.**—As the Melon season has been a very bad one, owing to our continuous sunless skies, a note on preserving them, I think, will not be out of place. Melons in frames set their fruit well with me this year, but they did not ripen well; in fact, they would not finish on the Vine, but decayed at the stalk; and therefore to preserve them I took them to a dry viney, laid them on a shelf for a few days till they were perfectly dry, thence to a cupboard beside the fireplace in my room, where they were placed,

FIG. 79.—ATHROTAXIS SELAGINOIDES.

enveloped in wadding about six times thick. In the middle of September I put in one which was quite green; and on October 20 on examining it I found it quite ripe and of a fine flavour. Another method for preserving very late fruits is to cut them when not over-ripe, with a clean cloth wipe them, then lay them for twenty-four hours in a dry place, afterwards burying them in sifted ash and enclose them in a cask or a perfectly air-tight box, where they may be kept sound until December, or even January. *G. Howes, Merton.*

**ASTER HYBRIDS.**—Under this head, on p. 515, my friend, Mr. E. J. Lowe, mentions two new seedling Michaelmas Daisies, which he supposes to be hybrids. As I have long been collecting all the best forms of this flower I may be allowed to say that any one who raises or calls attention to an improved variety of Michaelmas Daisy deserves the thanks of all growers of hardy herbaceous plants. The merits of Michaelmas Daisies for garden decoration were never more conspicuous than this autumn, when most of us had nearly all our flowers prematurely killed on October 1. Since that date to the present time these late flowering perennial Asters have made such a display with me in all my borders that the lost flowers were hardly missed. From time to time I come across new or improved forms, and I feel convinced that many exist which have not yet found their way to nurseries, and that others might easily be raised. It makes little difference to the gardener whether botanists consider

these varieties to be hybrids, or garden developments of a species, provided they are good. I have little doubt that there are many hybrid Asters in cultivation; three years ago I retained the services of a trained botanist to name my Asters, taking the Kew herbarium as the standard, and several of my best he gave up as coming under no name or description. One which Max Leichtlin sent me a few years ago as his "best Michaelmas Daisy," has been sent to two or three experts, none of whom ventured to assign it a name or a parentage. In early seasons many Michaelmas Daisies ripen seed, and brushing them when they are first flower with pollen from the best kinds, would be likely to produce good developments, whether of the same species or of hybrids. As for a cross between Aster and Erigeron, which Mr. Lowe mentions, there is no reason why it should not succeed. Asa Gray tells us that there is no natural line of division between them, and that the separation of these two species is purely arbitrary. I hope, therefore, that Mr. Lowe and others will not be discouraged because their attempts to make this cross have not yet been successful. *C. Wolley Dod.*

**DISEASE-RESISTING POTATOS.**—I should like to supplement the remarks of Mr. Murphy of Clonmel, in a recent issue of this journal upon the subject of disease-resisting Potato, by stating that in this neighbourhood every kind of Potato has this season been more or less affected by disease. There are considerable differences, however, as to the extent of the ravages, some varieties having escaped with about 1 per cent. of bad, while others are from 75 to 80 per cent. diseased. And in some cases labour is not being spent to lift and remove the tubers from the ground, which is certainly a mistake, [a crime rather], if it is intended to grow another crop of Potatoes in the immediate vicinity next year. The advantages of early varieties and of early-lifting have been clearly demonstrated in the present season, Ashleaf Kidneys, Myatt's Improved, Early Rose, and the like, which harvested at the beginning of August are keeping capitally; it being quite an exception to find a bad tuber during sorting. But in gardens where these varieties have been left in the ground until September, they too have become diseased. From many inquiries that I have made in this district, where the soil is of a moderately heavy loam resting upon clay and chalk, I find that of the late varieties and those left in the ground the longest, nothing this year approaches Beauty of Hebron and Magnum Bonum for disease resistance. In my own garden I had a plot of Dakota Reds which are a very late variety, and were not lifted until the haulms had been completely cut down by the frosts of September. In these but few were diseased, while a plot of Prime Minister grown by their side were three quarters bad. In one of Sir J. B. Lawes' experimental fields at Rothamsted, where Scotch Champion has now been grown for nine years in succession on the same land, and for four years previous to that the Rock variety was grown, and with the same description of manure applied to each plot of ground year after year, we find this year a smaller crop per acre than usual, and no kind of artificial manure that has been used appears to preserve the tubers from disease, although great differences are manifest in the quantities of bad developed, ranging from a few pounds to nearly a ton of diseased per acre. Potash salts seem to be a powerful preservative, but when these are applied together with large quantities of stimulating nitrogenous manures then the good effect of these salts appears to be neutralized. Peat-moss manure has been found in this neighbourhood a capital dressing for the growth of Potatoes, keeping the tubers beautifully clean and bright-skinned, and by keeping the soil open and assisting drainage, helps to promote disease-resistance. *J. Willis, Harpenden.*

**LONG-LIVED CUCUMBERS.**—Having for many years taken a deep interest in Cucumber growing, and with a large share of success—cultivators manage then in various ways both from seeds and cuttings—I quite agree with your correspondent, Mr. Froud, at p. 447, that there is very little difficulty in keeping Cucumber plants in good health for two years, provided they are grown in a properly constructed and well-heated houses. Twenty years ago I had the good fortune to raise a variety named Blue Gown, and in order to keep it true all the other seedlings were destroyed. It soon spread and filled the whole house, 16 feet by 10, producing some of the finest Cucumbers I have ever seen, and continued to bear for two years. Of course a little fresh soil and

liquid manure were supplied occasionally as required, and the older branches cut away from time to time, and young ones laid in. I have on many occasions allowed one plant to fill this same house, and am generally able to cut the best fruit for exhibition from plants grown on this method of extension. I prefer plants struck from cuttings for fruiting in summer, but seedlings for winter, as they have more vigour than cuttings, and in my opinion are more hardy. *T. Lockie, Oakley Court, Windsor.*

**TUSSILAGO FRAGRANS.**—In an able and practicable article on the formation of new herbaceous borders (p. 510), Mr. Horsfield gives a list of plants which he truly says will form "a fairly good and interesting collection;" there are, however, two species in that list that I would warn intending planters against introducing into their border; *T. fragrans* is one of these; it is a weedy looking plant, with dingy pale lilac flowers, very sweet, and produced in mid-winter. In a newly formed border the creeping rootstock would quickly run riot and become a nuisance, monopolising the ground to the detriment of the other plants; in fact, it is utterly unfit for a front-row plant, or any other part of the border. The flowers are certainly very welcome in the winter, and for these it could be planted in some semi-wood place. *T. farfara variegata* is a very pretty plant, but it has the same objectionable characteristic root as the former plant, and in rich soil there is always a danger of its reverting to the green type, which is a most difficult plant to eradicate. *J. W. Odell.*

**GAS-TAR.**—The way to use the gas-tar referred to in your last number, is to put a small piece of hay or straw-rope round the stem of the bush close to the ground, and it should be about 3 or 4 inches high; when the leaves are nearly fully expanded give the ropes a good coat of gas-tar: as it does not take much time to do a lot of them, it may be repeated once or twice during the summer, and if some fresh gas-lime is sown under the bushes, it will be all the better, as it will kill any grub that may be near the surface of the earth, and I feel sure, that any of your readers who may give it a trial, will be highly pleased with the result. Bushes treated in this manner were not attacked, and others left to chance, were completely defoliated. *J. M.intosh.*

**VIOLAS AS BEDDING PLANTS.**—I think that if the Council of the Royal Horticultural Society could be induced to invite collections of these at one of their spring meetings, to be shown in bloom in pots or pans, a very interesting exhibit might be obtained. A large number of varieties is now being cultivated, including some charming new varieties, and it is necessary the public should have an opportunity of seeing them. If classes could be provided for them at the Temple show, and sufficient inducements offered to bring growers from a distance, a delightful feature would be secured. When it is remembered what a leading feature Pansies and Violas in pots make at the great Whitson show at Manchester, and how much public notice they attract, it seems desirable that opportunity should also be afforded for such a display in London. *R. D.*

## SOCIETIES.

### NATIONAL CHRYSANTHEMUM.

The great metropolitan show of the season, held at the Royal Aquarium, Westminster, on Wednesday and Thursday last, brought together more than 500 entries, resulting in the largest show the Society has yet held. The quality was excellent as regards the class blooms, and less in plants in the groups. The large number of entries caused severe competition in most of the classes.

#### OPEN.

**Incurred.**—For forty-eight blooms, not less than twenty-four varieties, the place of honour was accorded to Mr. F. Doughty, gr. to Mrs. M. Tomlin, Angley Park, Epsom, for a stand of a truly superb lot of blooms of large size, even, clean, and solid, and of very fine substance, out of which the following varieties may be selected for name:—Golden Empress, Empress of India, Cherub, Norman Davis, Jardin des Plantes Violet Tomlin, Charles Gibson, Emily Dale, Princess of Wales, Alfred Salter, and Mrs. Halliburton. Mr. J. Horsfield, Hleytesbury, Wilts, was 2nd, following

closely with a beautiful solid and clean lot of large blooms, of which Empress of India, Jeanne d'Arc, Bronze Queen, and Lord Alcester, were the finest, and Prince Alfred, Jardin des Plantes, Baron Beust, Golden Eagle, and Mrs. Rundle were also highly creditable. The 3rd place being accorded to Mr. J. McKenzie, gr. to T. S. Cornwallis, Esq., Linton Park, Maidstone, who also showed large blooms of very good form Lord Alcester, Golden Empress, Barbara, Jardin des Plantes, Mrs. Heale, Cherub, Hero of Stoke Newington, Lady Telford, and Princess of Wales being the finest shown.

Twenty-four distinct.—In this smaller class Mr. Sullivan, gr. to D. B. Chapman, Esq., Downshire House, Roehampton, led with some capital flowers, but the general quality here was behind that of the forty-eight's—Barbara, Empress of India, Jardin des Plantes, Nil Desparandum, Golden Empress, John Salter, were the best—they were all rather inclined to be rather flat but in other respects they were good. 2nd, Mr. J. Doughty, with large blooms, but weak in the centre—Mrs. Hamilton, Mr. Bunn, Cherub, Princess of Teck, White Venus, and Jardin des Plantes, being the finest samples. Mr. A. Ives, gr. to E. C. Jukes, Esq., Hope House, Winchmore Hill, was 3rd, with blooms of good form and colour, but smaller than the foregoing—Lord Alcester and Golden Empress being good exceptions, however; and Mr. Bunn, Lord Wolsley, and Le Grand were the best of the others.

Twelve incurred.—Mr. T. Skinner, gr. to J. Aird, Esq., East Sutton Park, Staplehurst, was 1st in this class, from which those competing in the twenty-four were excluded; he had blooms of good average size and quality and of even form—Lady Hardinge, Empress of India, Princess of Wales, Queen of England, Emily Dale, and Jardin des Plantes being shown well.

Six blooms of any one variety.—Here there were eleven entries, and the competition was very close, Mr. J. Doughty leading with enormous heavy Golden Empress; while Mr. F. J. Thorne, gr. to J. T. Mackenzie, Esq., Sunningdale Park, Sunningdale, followed with Empress of India, but a shade smaller; and with the same variety Mr. J. Hewitt, gr. to H. B. Mackeson, Esq., Hill Side, Hythe, Kent, was 3rd.

Japanese, forty-eight blooms.—This was the leading class of the section, not less than twenty-four varieties were to be shown. Here Mr. J. McKenzie took a decided 1st, with a most wonderful lot of blooms, all large, vigorous, and brightly coloured, some being exceptionally large. E. Molyneux was 2nd, with a very good lot, and indeed, showed up well all through the exhibition; others were Madame J. Laing, Criterion, Val d'Andorre, Soleil Levant, Madame de Sévin, Madame C. Audigier, Comtesse de Beauregard, Elaine, L'Adorable, Mons. Brunet, and Baronne de Prailly. 2nd, Mr. W. Packman, gr. to C. E. Shea, Esq., The Elms, Fooks Cray, Kent, with a very fine lot of uniformly good size and bright colour—Jeanne Delaux, E. Molyneux, Criterion, Soleil Levant, C. Orchard, Mons. Freeman, Elaine, Martha Harding, La Triomphante, and Comte de Germany, being the most noticeable samples. The 3rd was Mr. Munro, gr. to E. J. C. Paul, Esq., Twickenham, who followed closely on the 2nd lot with Boule d'Or, F. A. Davis, Magnum Bonum, Val d'Andorre, Duchess of Albany, M. Marrouch, E. Molyneux, and Madame C. Audigier, as the best. These prizes were awarded in a keen race of fourteen competitors.

Twenty-four distinct.—The best were from Mr. C. Cox, gr. to J. Trotter, Esq., Brickenden, Grange, Hertford, who led with an even stand of blooms of fine size and very bright colours, of which the best were E. Molyneux, Carew Underwood, Peter the Great, Criterion, Madame C. Audigier, Ralph Brookbank, Soleil Levant, Mons. Tarin, and Le Triomphante. 2nd, Mr. J. Brown, gr. to Mrs. Waterloo, Great Doods, Reigate, with a fair even lot, with L'Or de Japon, Margot, Madame de Sévin, Dr. Macary, Carew Underwood, C. Orchard, Madame Baco, and Duchess of Albany, being the best represented. Mr. J. C. Waite, Glenhurst Gardens, Essex, was 3rd, with finely-coloured blooms of even average size, of which Duchess of Albany, Criterion, and Mrs. H. Cannell, were good.

Twelve distinct.—There was a capital show and an excellent competition in this class, from which exhibitors in the foregoing class were debarred. Sixteen lots were staged, and the leading prize was taken by Mr. S. Skinner, for a stand of very handsome blooms, slightly above the average in size, E. Molyneux, Golden Dragon, C. Underwood, F. Davis, Madame de Pigny, and Madame C. Audigier

being five examples. A close 2nd was made by Mr. C. Edwards, gr. to W. Owen, Esq., The Elms, Castle Bar, Baling, with smaller blooms, but very good, especially in Madame C. Audigier, Boule d'Or, Val d'Andorre, Madame J. Laing, Criterion, and Soleil Levant. Following very closely indeed upon this lot was a stand from Mr. S. Simpson, St. John's Nursery, Chelmsford, whose blooms of Japonais, Madame Audigier, Val d'Andorre, and Maiden's Blush were the best.

Six blooms (one white variety).—As many as seventeen exhibitors staged in this class, and the result was one of the features of the occasion. Competition ran close indeed, and a place of well-deserved honour was taken by Mr. J. McKenzie, with Meg Merrilies, very pure for that variety; Mr. W. Jupp, gr. to G. Boulton, Esq., Eastbourne, with Avalanche, was a near 2nd; and 3rd, Mr. W. Russell, gr. to Dr. C. H. Lewis, with fine samples of Mdle. Lacroix.

Six Japanese, any colour, one variety.—The fourteen entries produced a number of most beautiful and handsome blooms, Mr. J. McKenzie leading well with superb examples of E. Molyneux, very large, and gloriously coloured; 2nd, Mr. J. Doughty, with large, and highly coloured Belle Paule; 3rd, Mr. J. Hewitt, Maiden's Blush being the variety; other exhibitors here were also very creditable.

Twelve reflexed, large-flowered.—These were shown to the number of six lots, the 1st prize falling to Mr. C. Cox, gr. to J. Trotter, Esq., Hereford; the best blooms were Dr. Sharpe, Cloth of Gold, White Christine, King of Crimson, and Chevalier Domage. 2nd, Mr. Howe, gr. to H. Tait, Esq., Park Hill, Streatham Common—Chevalier Domage, Cloth of Gold, and Dr. Sharpe being his best blooms. Mr. Hill, gr. to Buckborough Park, Hythe, was 3rd, for a very good dozen, the varieties chiefly those already noted.

Twelve Japanese reflexed.—In a good competition the 1st place was taken by Mr. J. Hewitt, with large and full fine flowers of good substance—indeed, the blooms were all good in this class; Criterion, Maiden's Blush, Amy Furze, Jeanne Delaux, and Val d'Andorre were the best. 2nd, Mr. J. Kipling, gr. to Lord Lytton, Knebworth, with excellent even blooms of not over-large size; we noticed two very good flowers of Jeanne Delaux. Mr. D. Hill, gr. to F. D. Brockman, Esq., Beachborough Park, Hythe, followed closely, with Amy Furze, Maiden's Blush, F. A. Davis, and Val d'Andorre, a good form, and bright.

Twelve Anemones, large flowered.—In this class the entries numbered five, and the blooms generally were of excellent quality without any great disparity between the various lots. 1st, Mr. M. Sullivan, gr. to D. B. Chapman, Esq., Downshire House, Roehampton, with well furnished blooms of Nouvelle Alrede, Lady Margaret, Acquisition, and Thorpe Cray, a flower much like Glück, but having an orange-yellow centre instead of being all of one shade of yellow. 2nd, Mr. Ives, gr. to E. C. Jukes, Esq., Hope House, Wimbledon, smaller blooms, and perhaps they were less dressed; 3rd, Mr. M. Russell, gr. to C. H. Lewis, Esq., Henfield, with nice flowers, but too small.

Twelve Japanese Anemones.—The best stand of these was that put up by Mr. Ives, Hope House, whose Madame Cabrol, Jeanne Marty, La Deuil, very fine crimson; Sœur Dorothy Souelle, and Madame Bertha Pigny were fine large flowers.

There were three nice stands of the pretty Anemone pompons, so useful as cut blooms and when grown as small plants. 1st, Mr. R. Whibley, King Edward's School, Southwark; 2nd, Mr. Hillier, 3, Priory Road, Wandsworth.

Pompons as cut flowers were sparsely shown, Mr. Russell, of Henfield, taking 1st; and Mr. Duncan, gr. Warnham Court, Sussex, 2nd.

**M. Delaux's Prizes.**—M. Simon Delaux, Toulouse, France, offered prizes for the best and largest varieties sent out by him in the years 1887 and 1888, and Messrs. Davis & Jones, Lilford Nurseries, Camberwell, contributed a collection of about fifty varieties in small examples; M. Bergman, a reflexed Japanese, very bright yellow, the petals curled—very pretty; Mdle. Louise Leroy, white, fluted and pointed, Japanese reflexed; Madame Meyard, Mr. Drake, and Othello may be selected as the best. Mr. W. Holmes, Frampton Park Nurseries, Hackney, was a good 2nd in this division, with smallish bright flowers of Mrs. J. J. Hillier, Lincoln's Inn, Maidenhead, and Lucien Battet and Malibran, among others. These were the only exhibitors.

*Amateurs who do not employ paid Assistants.*

Twelve incurred.—This small competition brought some skillfully grown and manipulated flowers, a few perhaps being a trifle over-blown. The 1st prize was taken by Russell Bradbury, Esq., Wealdstone, Harrow, whose best bloom was Empress of India, which was about twice as large as a specimen of G. Glenny, the smallest. 2nd, Mr. G. P. Clarke, Fishpool Road, Hitchin, with large blooms, but a little rough looking; 3rd, Dr. W. Walker, 12. Lingfield Road, Wimbledon, whose blooms were fair and even as regards size.

Six Incurred.—In this class were nine entries. 1st, Mr. F. Glascock, South Street, Bishop's Stortford, whose flowers were magnificent—Alfred Salter, Empress of India, and the golden variety, Queen of England and Prince of Wales, being the finer ones. 2nd, Russell Bradbury, Esq., with neat but much smaller flowers—Jeanne d'Arc, Nil Desperandum, and Refutation were his best; Mr. Walker, Wimbledon, took the 3rd prize.

There were eleven entries in the class for twelve Japanese, and Mr. T. Carruthers, Reigate, Surrey, contributed a stand of very fine flowers of good average size, which do him great credit, the best being Soleil Levant, L'Or du Japon, Mons. Freeman, and Val d'Andorre. Mr. H. Briscoe Ironside, Esq., The Firs, Foot's Cray, Kent, had a fine bloom of Mons. J. Laing and J. Mahood, and Val d'Andorre were also good; he was a close 2nd; Russell Bradbury, Esq., Wealdstone, Harrow, coming in as a creditable 3rd, having Madame R. Rendatler, Dormillon, and Peter the Great in fine examples.

In the smaller class there were the same number of entries, the place of honour being taken by Mr. H. Fineham, Union House, Cranbrook, who had a very splendid lot, in which *Midle. Lacroix*, *Belle Paule*, *Carew Underwood*, and *Dormillon* figured well. Mr. Glascock was 2nd, with *M. Marrouch* and *R. Brocklebank*; and 3rd, H. Briscoe Ironside, Esq., following closely, showing good specimens of *W. Holmes*, *E. Molyneux* and *Paule Dutoir*.

*Anaturs employing one Gardener, and Single-headed Gardeners.*—Twelve incurred.—In this competition there were seven entries, and the flowers were generally of fair quality, if not of Brobdingnagian proportions. 1st, Mr. Emery, gr. to R. W. Tweedie, Esq., Avoca, Eastbourne—the usual good varieties finding place on the stands; 2nd, Mr. Todd, gr. to Dr. Southey, Sutton Vallance, Kent, with full-formed, smooth blooms; 3rd, Mr. W. Rogers, Elwick Road, Ashford, Kent—a nice even lot of blooms less fully blown than those which took the better prize.

Six incurred.—Here there were ten entries, Mr. Emery taking the 1st place. Mr. G. Jordan, gr. to the Rev. H. Berners, Hawkstead Rectory, Ipswich, the 2nd, with fair blooms that were even as to size; and Mr. Todd the third.

Twelve Japanese Distinct.—In the leading class for Japanese Blooms Mr. Todd was 1st with a stand of very fine solid flowers of good substance—Margaret Marrouch, Soleil Levant, Jeanne Delaux, Criterion, Dormillon and Madame Laing were the best. Mr. A. Emery followed with large bright samples of *E. Molyneux*, *Soleil Levant*, *Madame Baco*, *Madame J. Laing*, *Avalanche*, and *Maiden's Blush*. 3rd, E. Mawley, Esq. Rosebank, Berkhamstead, for an even clean, and vigorous lot of blooms, in which *Comte de Germiny*, *M. Marrouch*, *Martha Harding*, *Peter the Great*, *Madame B. Rendatler* and *Belle Paule* may be named.

Six Japanese Distinct.—There were fourteen lots staged here and a fine lot of blooms were shown; competition was keen, and Mr. Emery led with *Madame Baco*, *E. Molyneux* and *Avalanche* in fine specimens, large and bright. 2nd, Mr. Todd, who followed closely with *Maiden's Blush*, *Madame de Sivin*, and *J. Delaux* as his best. 3rd, Mr. T. Caryer, gr. to A. J. Messner, Highgate, with fair and very bright blooms of *Soleil Levant* and *Belle Paule* as his chief.

*Metropolitan Classes.*—Twenty-four incurred, not less than eighteen varieties.—Here Mr. Gilbey was 1st, with fine globular, full flowers of the best varieties—the back row being composed of very fine flowers; 2nd, F. Bingham, Esq., G. Bethune Road, Stoke Newington, whose stand was but few points behind Mr. Gilbey's, only the front row exhibiting weakness.

Twelve incurred, distinct.—In this competition Mr. Gilbey succeeded in taking the 1st place, with medium-sized flowers of very fair quality: Mr. H. Nichols, Verandah House, Upper Clapton, was 2nd, with full regular sized blooms, of fair size.

Japanese.—Mr. Buck, gr. to — Seligman, Esq., South Kensington, was the leader, with twelve distinct good-quality blooms, *Criterion*, *Val d'Andorre*,

and *Midle. Lacroix* being good sized samples; Mr. Gilbey was 2nd, with small flowers; the same exhibitors taking the corresponding places in the class for six distinct, and showing blooms of the same quality as in the larger.

#### THE SOCIETIES' CHALLENGE TROPHY.

This is a prize offered to be competed for by gardening societies, the collection to be made up of blooms selected from the collections belonging to the members of the Society. There is a cash prize of £10 to go to the growers, and a trophy to be held by the President of the winning society for one year. On this occasion there was a good display here, the class consisting of twenty-four incurred and twenty-four Japanese blooms. The successful society was "The Weald of Kent Gardeners' and Cottagers' Mutual Improvement Society," and all the blooms were the contribution of one member, Mr. Doughty, whose name appears elsewhere in the prize list; he had a fine lot of large, clear, even and bright blooms of high quality—*E. Molyneux*, *Carew Underwood*, *Madame B. Rendatler*, *Madame de Sivin*, *Belle Paule*, *Madame Baco*, *Madame C. Audigier*, *Dormillon*, *Criterion*, *Boule d'Or*, and *Grandiflora* were good Japanese; and of incurred, *Lord Alcester*, *Golden Empress*, *Bronze Queen*, *Hero of Stoke Newington*, *A. Salter*, *Jardin des Plantes*, *Violet Tomlin*, and *Empress Eugenie*. Other exhibits were good also.

#### GROUPS OF PLANTS IN POTS.

The groups were this year not quite up to the last year's standard in vigour and substance. In the group to be arranged in 100 square feet, Messrs. Davis & Jones were 1st with a well-balanced group of neat and good plants, well flowered and bright; 2nd, Mr. J. Judd, gr. to F. W. Prior, Esq., Gordon House, Blackheath, with plants bearing smaller blooms; 3rd, Mr. J. Townsend, Providence Nursery, Putney, who had some good incurred varieties. For a decorative group of Japanese in 60 square feet, Messrs. J. Laing & Son, Forest Hill, S.E., led with a tasteful arrangement of well-flowered dwarf plants, chiefly in 48 pots, and three or four blooms on a plant, and good samples of the popular varieties were to be noticed with some few of the more recent. Mr. J. W. Witty, London Cemetery Co., Highgate, was second with plants not so well flowered; also Messrs. Davis & Jones being a fair 3rd, with small flowered plants.

Trained Plants.—Mr. J. Brooks, gr. to W. Reynolds, Esq., The Grange, Highgate, led for nine trained specimens with dwarf plants, well flowered, of *Elaine*, *W. Robinson*, *Margot*, *Mad. B. Rendatler*, *Bouquet Fait* and *Lady Selbourne*. It may be remarked that this section of the show was a decided improvement in quality over last year, 2nd, Mr. Easey, gr. to J. W. Jones, Esq., The Grange, Highbury, with standards bearing rather smaller blooms—*L'Africaine*, *Margot*, and *Christian* (Golden) being the best. Mr. W. Davey, gr. to C. C. Paine, Esq., Cedar House, Stamford Hill, N., was 3rd, following closely with similar plants.

The best four standards were from Mr. S. Gilbey, gr. to B. B. Booth, Esq., The Cazenoves, Upper Clapton, with *Margot*, *Madame B. Rendatler*, and *Dr. Sharpe*, in fine condition. Mr. Davey was 2nd, with less vigorous plants, and 3rd, Mr. G. H. Cooper, nurseryman, Sydenham Road, Groydon, with small-headed plants. This exhibitor also showed in the class for six trained pampas, where he showed a reflexed, and was disqualified, but was awarded an extra prize; and he was also again to the fore with six trained specimens, large-flowering varieties, having *Madame B. Rendatler*, *Margot*, and *Midle. Lacroix*, as the best; 2nd, Mr. Easey, with good low standards; and 3rd, Mr. H. Lovegrove, gr. to H. Spicer, Esq., Highbury, who showed well. The best four were from Mr. F. E. Wright, gr. to Miss Oxley, The Lawn, Upper Clapton, having *Bouquet Fait*, *Source d'Or*, and *Margot*, as fine samples of low pyramids; Mr. Lovegrove coming 2nd, with fair samples; and in the class for prizes offered by Messrs. Wood & Son, Mr. G. H. Cooper added one more honour to his list.

#### FRUITS AND VEGETABLES.

*Apples.*—These were largely and finely shown, and there was much more colour in them than might have been expected. Mr. C. J. Goldsmith, The Gardens, Kelsey Manor, Beckenham, was placed first with excellent fruit of *Hed. Reinet*, *Gascoigne*, *Ribston*, *Blenheim Orange*, *Cox's Orange Pippin* and *Wor-*

*cester Pearmain*. Mr. F. Miller, Northlands, Margate, was a capital second, with 6 dishes of *Antony Apples*. Mr. J. McKenzie, The Gardens, Linton Park, Maidstone, was 1st with grand samples of *Peasgood Nonsuch*, *Stones*, *New Hawthornden*, *Emperor Alexander*, *Stirling Castle* and *Gloria Mundi*. Mr. F. Miller, was again 2nd, with a very fine lot, indeed the *Culinary* varieties were particularly fine.

*Pears.*—These were finely shown in dishes of 6. Mr. C. J. Goldsmith coming in 1st, with *Duchesse d'Angoulême*, *Pitmain*, *Duchesse de Beurre*, *Diel Durand*, *Beurre Bachelier*, and *Louise Bonne* of *Jersey*; 2nd, Mr. W. Allan, The Gardens, Gunton Park, Norwich.

*Grapes.*—The best three bunches of white Grapes was *Muscat of Alexandria*, from Mr. A. Luff, The Gardens, Oakfield, Wimbledon; and Mr. C. J. Goldsmith being 2nd, with the same variety.

The best three bunches of black Grapes were very finely fruited black *Alicante* from Mr. Howe, Park Hill, Gardens, Streatham Common; Mr. J. Batten Hollywood House Gardens, Wimbledon Park, being 2nd, with *Gros Maroc*.

The best three bunches of *Gros Colman* were shown by Mr. J. Lambert, Onslow Gardens, Shrewsbury; Mr. J. Craven, Osborn, Potter's Bar, being 2nd.

Three very fine *Providence* Pine-apples from Mr. C. Ross, The Gardens, Welford Park, Banbury, were highly commended.

*Potatoes.*—These are very finely shown all round. The samples were large, clean, and remarkably fine in shape. The best twelve dishes came from Mr. J. Hughes, the Gardens, Eydon Hall, Byfield, who had splendidly finished examples of *Chancellor*, *Snowdrop*, *Abundance*, *Sutton's Thirty-six*, *Purple Perfection*, *Queen of the Valley*, *London Hero*, *Adirondack*, and *Reading Ruby*. 2nd, Mr. E. S. Wiles, the Gardens, Edgote Park, Banbury.

Mr. Wiles had the best six dishes, having *Satisfaction*, *Snowdrop*, and *Mr. Breese*, of splendid quality. Mr. Hughes was 2nd.

The special prizes offered by Messrs. Sutton & Sons for three dishes brought a very keen competition, and here Mr. E. S. Wiles was 1st, and Mr. G. Goldsmith, Floore Gardens, Weedon, 2nd.

Mr. Wiles was also 1st in the class for nine varieties, the special prizes offered by Mr. C. Fidler, staging some very fine tubers; Mr. L. Harris, Bradenshaw, High Wycombe, being 2nd.

Mr. Fidler's three dishes were also well competed for, Mr. J. Hughes being 1st, and Mr. E. S. Wiles 2nd.

With three dishes, Mr. L. Harris was 1st, and Mr. R. Lye, Sydmoncton Court Gardens, Newbery, 2nd.

*Vegetables.*—These were also numerously and very finely represented. Messrs. Sutton & Son's prizes for six dishes brought great competition; the best coming from Mr. L. Haines, The Gardens, Colleshill, Shrivernham. Mr. C. J. Waite, The Gardens, Glenhurst, Esher, being 2nd.

Messrs. Webb & Sons also offered special prizes for six dishes, Mr. J. Hughes being 1st, and Mr. R. Lye, 2nd.

The best nine specimens of *Rousham Park Onion* came from Mr. N. Kneller, Malshanger Gardens, Basingstoke; Mr. A. Miller, the Gardens, Rood Ashton, Trowbridge, being 2nd.

Mr. T. Doherty, the Gardens, Wroxton Abbey, Banbury, had the best six specimens of *Deverill's Anglo-Spanish Onion*, Mr. A. Miller being 2nd.

Mr. Doherty was also 1st with *Improved Wroxton*, Mr. C. W. Howard, Bridge, Canterbury, being 2nd. Really the Onions were wonderfully fine.

*Miscellaneous Exhibits.*—These filled a great space of tabling. Of Potatoes, Messrs. Sutton & Sons and C. Fidler had very large representative collections of great merit; and Messrs. H. Deverill & Sons, very fine samples of their new Onions and vegetables. Of Apples and Pears, highly meritorious collections came from Messrs. James Veitch & Sons, T. Rivers & Son, G. Bunyard & Co., C. Lee & Son, and Messrs. J. Laing & Co. A long table of very handsome Ferns was set up very tastefully by Mr. B. May, Dyson's Lane Nursery, Edmonton. Messrs. H. Cannel & Sons, Swanley, Kent, contributed a very extensive collection of blooms of tuberous Begonias and plants of *B. The Octavia* in flower, and only about 6–8 inches high. The colour is pure white. Also a number of bunches of zonal Pelargoniums, and a large number of cut *Chrysanthemums*, in leading the favourites. Messrs. Hooper & Co., Covent Garden, sent a collection of *Primulas* in pots.

## FLORAL COMMITTEE.

The Floral Committee met on Thursday. At this gathering, there was a good attendance. The President, Mr. E. Sanderson, in the chair. A large number of new varieties were sent for inspection. First-class Certificates were awarded to the following varieties:—James Weston (Japanese Anemone), the grand petals pure white, with primrose centre, very pretty and pleasing, from Mr. J. Ridout, gr. to T. B. Haywood, Esq., Woodhatch, Reigate; George Daniels (Japanese), delicate pink, very fine; Avalanche (Japanese), pure white, very fine and pleasing; Fimbriatula (Japanese), delicate blush, pale primrose and white centre; and Miss Gärten (Japanese), delicate silvery peach, darker in the centre—all from Mr. R. Owen, nurseryman, Maidenhead. To Florence Percy (Japanese), a charming pure white variety, from Mr. E. Molyneux, The Gardens, Swanmore Park, Bishops Waltham; to Alfred Lyme (incurred), a pretty silvery-lilac sport from the white; Novelty, a very full and fine flower, from Mr. J. Lyme; to Othello (Japanese), orange-buff, with a dark reddish-brown centre, fine and full; from Mr. George Stevens, St John's Nursery, Putney; and to Mons. Bernard (Japanese), dark magenta, with silvery reverse; from Messrs. J. Laing & Co., Stanstead Park Nursery, Forest Hill.

A golden sport from Mrs. Heale (incurred) came from Mr. H. R. Hayes, which the committee wished to see again in better condition; the same request was made respecting Miss Mary Byss (Japanese), a charming flesh-coloured sport from Madame J. Laing; one flower only being produced. Mr. W. Holmes, Frampton Park Nursery, Hackney, sent Mrs. J. J. Hillier (Japanese), a very pretty variety in the way of Faustine. The committee wished also to see this again. Albert Victor (Japanese), from Mr. J. Ridout, is a very promising variety, but shown on this occasion in poor form. A yellow-flowered single annual Chrysanthemum named Golden Fleece, from Mr. R. Owen, was Commended.

A vote of thanks was passed to Mr. E. Baxter, gr. to R. C. L. Bevan, Esq., East Barnet, for a basket of seedling winter-flowering Pinks, that promise to be very useful for cutting from.

From Mr. G. Braid, Winchmore Hill, came a bright deep red *Primula sinclairii*, of good colour.

## KINGSTON AND SURBITON.

NOVEMBER 6.—Despite the unfavourable nature of the weather, the Kingston Chrysanthemum Society was able to hold an excellent show on the above date, which promises well for the general quality of exhibition blooms. It is true that in former years there have been fine shows at Kingston, but the exhibition of this year was very satisfactory in all sections, and the entries were numerous, and the competition keen.

For a collection of forty-eight cut blooms, twenty-four Japanese and twenty-four incurved, there was offered (for the first time) a fifth Challenge Vase, presented by Sir W. Ellis, Bart., M.P., the vase becoming the property of the exhibitor. The hall was twice full. Here Mr. E. Coombs, gr. to T. W. Furze, Esq., Teddington, staged a magnificent lot, and was especially strong in the Japanese, having bloom of large size, clear and bright, the best being Val d'Andorre, Mons. Freeman, Ed. Molyneux, Fair Maid of Guernsey, Mons. Delaux, Madame C. Audigier, Soleil Levant, and Madame J. Laing.

The incurved flowers were also of a high order, and uniformly neat, excellent samples of Lord Alcester, Princess of Wales, James Salter, Queen of England, Golden Eagle, Beauty, Mr. Bunn, Refugence, and Lord Wolsley, being shown. In the 2nd prize lot, from Mr. J. Quarterman, gr. to C. E. Smith, Esq., Cobham, there were some fine Japanese blooms, of which S. Molyneux, Jeanne Delaux, Soleil Levant, Carew Underwood, and Madame C. Audigier, were the best. Incurved blooms were rather flat, Princess of Tech, however, being good. The 3rd place was awarded to Mr. E. Cavte, gr. to T. J. Robinson, Esq., Brookleigh, Esher, with Lord Alcester, as the best incurved, and Brooklebank, C. Orchard, E. Molyneux, and Baronne de Prailly, as the leading Japanese, which were all of high merit, but the incurved were not fully developed.

*Incurved*.—In the leading class for (twenty-four the best stand was set up by Mr. C. Gibson, gr. to J. Wormald, Esq., Morden Park, Surrey, the back row containing a grand lot of blooms, Alfred Salter, Empress of India, Lord Alcester, Princess of

Wales, and Jardin des Plantes, being particularly noticeable. Mr. Coombs followed well with a nest lot of smaller flowers, with strong blooms of Lord Alcester and Princess of Wales; 3rd, Mr. Sullivan, gr. to D. B. Chapman, Esq., Downshire House, Roehampton, also having an even, clean stand; 4th place being accorded to Mr. Allen, gr. to Sir G. Russell, M.P., Sallowfield Park, Reading, whose excellent blooms of Lord Alcester was selected as the premier incurved of the show: it was very even and clean, measuring across its face from edge to edge, 10 inches.

The stands of twelve incurved brought out a good display, and a keen competition, Mr. C. Slade, gr. to Lady Bowater, Richmond Park, taking the leading honours with large well grown blooms, Lord Alcester, Empress of India, Golden Empress, Mr. Bunn, and Alfred Salter, being the best; Mr. W. Reed, gr. to E. Pettit, Esq., Oatlands Park, Surrey, following closely with an even and clean lot—Barbara, Mr. Bunn, and Lord Alcester, showing up well.

In the minor class for single incurved (one variety), the 1st place was given to Mrs. J. Daniels, Inglewood, Kent Gardens, for some heavy blooms of Empress of India, which would have looked better if they had not been displayed on blue paper over the stands; Mr. Coombs followed with Golden Empress of India. There were fourteen competitors.

*Japanese*.—The colours of the blooms in this section were beautifully bright, and the blooms generally of fine size; the best twenty-four were those of Mr. C. Gibson—a very beautiful stand of bright, even, and large blooms, strong in the following:—E. Molyneux, C. Andigier, Sarah Owen, Val d'Andorre, Maiden's Blush, Criterion, Carew Underwood, Madame J. Laing, Yellow Dragon, and Mrs. J. Wright.

Very closely following was Mr. J. Munro, gr. to E. T. Paul, Esq., Cambridge House, Twickenham, with large and clean specimens of F. A. Davis, M. Marroux, Fair Maid of Guernsey, Val d'Andorre, Madame C. Audigier, Magnus Bonum, Domino, and a specially fine bloom of Boule d'Or, measuring 10 inches across, selected as the premier Japanese in the show.

Mr. C. Beckett, gr. to F. H. Bryant, Esq., Juniper Hill, Dorking, was a capital 3rd, with F. A. Davis, Madame C. Audigier, Soleil Levant, Avalanche, and Hamlet, in fine specimens.

In a very close and large competition for twelve Japanese, distinct, Mr. J. Snow, with large, bright flowers, led, having, as his finest, E. Molyneux, Soleil Levant, F. A. Davis, Madame C. Andigier, and Brooklebank; 2nd, Mr. J. Williams, gr. to J. Pearson, Esq., The Grange, Kingston, with Soleil Levant, E. Molyneux, Hamlet, and Duchess of Albany, as the best. Mr. R. Cavte was 3rd, showing very clean and neat, but rather smaller blooms.

Mr. J. Snow, South Park Gardens, Wadhurst, Sussex, had the best six blooms of one variety, taking the first place with excellent large samples of E. Molyneux. Mr. C. Beckett and Mr. Coombs were respectively 2nd and 3rd, with Madame C. Audigier and Duchess of Albany. There were many exhibitors, and the prize winners all had highly creditable blooms.

*Reflexed, Anemones and Pompons*.—Mr. Cavte and Mr. C. Gibson were the prize-winners in the order named for twelve reflexed blooms, the former having bright, even, and good-sized flowers of Cullingfordi, Chevalier Damage, Amy Furze, Dr. Sharpe, and King of Crimsins; Mr. Gibson's lot being very fine, but of smaller size.

Mr. Sullivan took the leading honours in the class for twelve Anemone-flowered varieties, and also for twelve Japanese ditto, and in both instances he led well, his finest varieties being Lady Margaret, Gluck, Acquisition, Emperor, Jeanne Marty, Bacchus, Marguerite Solleville, and Margouline, all being large and clean. Mr. G. Woodgate, gr. to the Lady Wolverton, Warren House, Kingston, followed in the Japanese flowered, and Mr. Coombs in the other section, each having clean and bright samples. Mr. C. Slade took 1st for Anemone pompons, having Antoinette, Astarte, Miss Nightingale, and Astrea.

*Amateurs*.—In the section confined to amateurs who do not employ a gardener on more than one day per week, there were some highly creditable exhibits, Dr. Walker, of Wimbledon, leading for incurved varieties; and Mr. Smithers, who followed here, led for Japanese with fine blooms; pompons being best represented by Mr. E. Drovett, The Firs, Teddington.

*Plants in pots* were fairly numerous, and several were good specimens, evidencing careful cultivation, especially in the case of trained incurved, but it is needless to particularise here, Messrs. Cavte and

Reed dividing the chief prizes between them, the former leading in the majority of cases.

*Groups*.—There were two classes provided for these, Mr. G. Springthorpe, gr. to R. H. Alexander, Esq., Gifford House, Roehampton, receiving 1st, for a group of Chrysanthemums in pots arranged for effect in 50 square feet, who had some really fine blooms here, fairly well mixed, but the Japanese varieties in the greater part. Mr. H. W. Pitcher, gr. to Mrs. Dunnage, Albany House, Surbiton, was 2nd, but was a long way behind.

For the group of miscellaneous plants arranged for effect in 100 square feet, Mr. J. Buss, gr. to A. Aston, Esq., West Hill Lodge, Epsom, was awarded 1st, for a tasteful and neat arrangement of Crotons, small Palms, Bouvardias, Chrysanthemums, Odontoglossum grande, and Adiantums as a base. 2nd, Mr. T. A. Glover, gr. to F. Ellis, Esq., Manor House, Wallington, with a pretty combination of Crotons, Dracenas, Pandanus, yellow Oncidiums, Cyrtopodiums, and Aracaria excelsa as a centre, but the wide arrangement was too flat.

*Fruit*.—Grapes were very fine, especially the black varieties, where out of fifteen competitors, Mr. C. Griffin, gr. to Miss Christy, Coombe Bank, Kingston, led with three fine bunches of Black Alicante, closely followed by Mr. T. Batten, gr. to A. Venables, Esq., Hollywood, Wimbledon, with Gros Maroc, in fine condition; and 3rd, Mr. Bowerman, gr. to C. Hoare, Esq., Hackwood Park, Basingstoke, with Black Alicante, all three exhibits being well finished, and large in the berry. Mr. Griffin and Mr. Bowerman were 1st and 2nd in a good competition for white Grapes, having excellent large, and finely coloured Muscat of Alexandria. Mr. W. Bates, Poulett Lodge, Twickenham, and Mr. Glover were respectively 1st for Apples and for Pears (four dishes), with clean fruit in both cases.

## SOUTHAMPTON CHRYSANTHEMUM.

NOVEMBER 1 AND 2.—The show of the Royal Southampton Horticultural Society held as usual in the Victoria Skating Rink was a fine affair; the competition keen, and the flowers, &c., of the first quality, particularly when the earliness of the date and the lateness of the season are considered. Cut bloom was the most important section, and as many as 1,040 blooms were exhibited.

The specimen plants and groups were all that could be desired. Fruit was meritorious and made a fine show, particularly the Grapes; and the vegetables shown were good and in large quantities.

Cut blooms, in twenty-four varieties class.—Eleven competed, the first prize falling to Mr. E. Molyneux, gr. to W. H. Myers, Esq., Swanmore Park, Bishop's Waltham, for capital specimens of the Japanese varieties, such as Edwin Molyneux, Golden Dragon. The incurved varieties were full, solid, and well finished.—Empress of India, Lord Alcester, and Queen of England being most conspicuous. 2nd, Messrs. W. and G. Drovett, of Fareham, the Japanese were good, but less even than in the 1st prize stand, while the incurved flowers were rather weak in the back row.

Mr. Molyneux won easily in the twelve blooms class with flowers identical in quality to those in the previous competition; 2nd, Mr. Neville, gr. to F. W. Flight, Esq., Twyford, Winchester.

For twelve incurved, distinct varieties, Mr. Inglefield was 1st with moderate flowers; 2. Mr. C. Wade, gr. to Sir F. Bathurst, 2nd.

Twelve Japanese.—1st, Mr. Inglefield, with clean, even, fresh blooms. Mr. C. Brooks, gr. to H. A. Simmonds, Esq., Red Rice, Andover, was 2nd. Eleven competitors entered.

Messrs. Drovett staged the best among nine lots of twelve Anemone-flowered varieties.

Mr. Allen was 1st for twelve reflexed varieties, with neat, fresh, not over large blooms.

Plants were best staged by Mr. W. Joy, nurseryman, Shirley, and Mr. Wills, gr. to Mrs. Pearce, The Firs, Basset, the former taking leading honours for four Japanese varieties, and for the best white flowered variety to be grown with *Ichthyomys* Guano, the prize in this case being given by Mr. W. Colchester, to a fine plant of Lady Selborne, fully 5 feet in diameter and freely flowered; the other varieties were Bouquet Fait, Mdle. Bertie Rendatler as the best.

Mr. Wills took leading honours for the best four varieties, incurved or reflexed; and the 1st prize for a single specimen, incurved or reflexed, with Dr. Sharpe.

Mr. Busby, gr. to F. Willan, Esq., Thornhill Park

Bitterne, Southampton, staged the best group, occupying a space 10 feet by 6 feet, the plants being dwarf, well clothed with foliage, and with blooms of good quality.

Fruit made a capital display, especially the Grapes, the competition being keen, while the best Pine-apple, a Smooth Cayenne, came from Mr. Richards, Somerley, Ringwood.

Fruits and vegetables were shown in great quantities and of generally fine quality, moreover some few Orchids were exhibited by local cultivators.

### HAVANT CHRYSANTHEMUM.

OCTOBER 31.—The Havant Chrysanthemum Society was the first to start the show season of the Chrysanthemum by holding its show at this rather early date; but, as the result proved, the Chrysanthemums shown, particularly the cut blooms, in which much rivalry existed in the neighbourhood amongst local growers, were very fine.

But to begin the most important part of the exhibition, we will notice first the twenty-four distinct varieties, half to be incurred, and the remainder Japanese. Mr. C. Penford, gr. to Sir F. Fitzwygram, Bart., Leigh Park, Havant, was 1st, showing Edwin Molyneux, Carew Underwood, Martha Harding, Thunberg, Golden Empress, and Princess of Wales; 2nd, Mr. A. Payne, gr. to Mrs. Smith, The Oaks, Emsworth, whose incurved flowers were his best.

The winners of the best eighteen varieties were—Mr. W. Roberts, gr. to E. R. Longcroft, Esq., Havant, 1st, with massive specimens of Lord Alcester and Empress of India, Belle Paule, and other fine varieties; and Mr. J. Agate, Havant, 2nd, he also showing well.

In the twelve Japanese, Mr. A. Payne won the 1st place, flowers of C. Audiguer and Balmorean being very noteworthy.

In the incurved class, Mr. C. Penford staged the best three. Very fine were the Emperor of Wales, Jean d'Arc, Lord Wolsley, and Prince Alfred.

For twelve large Anemones, 1st, Mr. Woodgine, gr. to Captain Boyd, Emsworth.

Mr. Penford staged the best twelve reflexed blooms in six varieties—a neat lot, King of Crimson, Dr. Sharpe, and Cullingfordii being the best.

For twelve Japanese Anemones, Mr. Penford took leading honours with a good stand, Bacchus, Margaret, Villageoise, and Fabian de Mediana being the best.

Mr. Roberts had the best group of Chrysanthemums—40 square feet—a capital lot, well arranged and carrying massive blooms.

Mr. Agate had the best group of pompons, well arranged and consisting of some of the leading varieties.

Mr. N. Fuller, gr. to Sir F. Clarke Jervois, Bart., Idsworth House, Harewood, staged the only collection of specimens in six varieties which were creditable.

Fruit and vegetables were likewise shown.

### SCOTTISH HORTICULTURAL ASSOCIATION.

THIS Society held its ordinary monthly meeting on the 6th inst. in 5, St. Andrew Square, Edinburgh, Mr. Malcolm Dunn, Dalkeith Gardens, in the chair. A paper was read by Mr. Henderson, Secretary of the Edinburgh Cemetery Company on the subject of "Cemetery Decorations." In contrasting the old churchyards with the modern cemetery the writer gave an interesting *resumé* of the progress that had been made during the past generation in taste and in sanitary conditions in relation to burial places. The paper was listened to with much interest, and after appreciative and critical remarks by Messrs. Hugh Fraser, Riddell, Laird, Sutherland, McKenzie, and others, which were wound up by the Chairman, a cordial vote of thanks was given to the writer.

Of exhibits on the table were six pots of *Calanthe Veitchii* from Mr. Smith, The Gardens, Dysart House, which were remarkable examples of superior culture. The spikes were exceptionally strong and floriferous and the lower part of the stems clothed with large foliaceous bracts. A Cultural Certificate was awarded to the exhibit. Messrs. Dicksons & Co. exhibited a collection of pompon and Cactus Dahlias, and French and African Marigolds, in beautiful fresh condition, from their Pilrig Nurseries, as showing the mildness of the season; and Messrs. Munro & Ferguson showed a notable plant of *Madame Desgranges* Chrysanthemum, grown in a natural

way in a 9-inch pot, which bore 140 blooms of good size.

The papers announced for next monthly meeting, December 4, were:—"The Culture of Asparagus," by Mr. Alex. Porter, Leuchie; and "Decorative Palms," by Mr. C. J. McKenzie, Warriston Nursery.

### BATH FLORAL FETE.

At this show, reported at the time in our columns, there were tents devoted to plants of botanical interest, on account of the British Association which was holding its meeting in this city at the same time. The most conspicuous feature was that of British Ferns, the unique varieties of Colonel Jones of Clifton (mostly from the Clifton Zoological Gardens), and of Mr. E. J. Lowe, F.R.S., of Shirenewton Hall, near Chepstow. Made a grand display, numbering some hundreds of well-grown plants. All the 1st and 2nd prizes were taken by these two gentlemen who between them also secured thirty First-class Certificates for very distinct new varieties. New Ferns also came from twelve other well-known growers. Such a collection has never before been brought together. A complete list of the certificates for which we could not find space at the time, is now added, in order that a record may be secured of plants that may never again be exhibited.

#### FIRST-CLASS CERTIFICATES.

To Colonel Jones, of Clifton, for *Athyrium filix-femina* var. *unco-Craigii*, *Polystichum aculeatum* var. *polydactylum*, *P. angulare* var. *frondoso-cruciatum*, *P. a. var. acutibolum-cruciatum*, *P. a. var. cruciatum-polydactylum*, *P. a. var. frondoso-bulbiferum*, *P. a. var. decompositum magnificum* *polydactylum*, *P. a. var. divisilobum-polydactylum*, *P. a. var. decompositum splendens* *polydactylum*, *P. a. var. multilobum* *polydactylum*, *P. a. var. inaequale variegatum* *polydactylum*, *P. a. var. divisilobum elegans*, *P. a. var. latifolium* *grandiceps*, *P. a. var. polydactylum grande*, *P. a. var. divisilobum plumosum robustum*, *P. a. var. foliosum-cristatum*; *Scolopendrium vulgare* var. *crispum latissimum*, *S. v. var. crispum robustum*, and *Lastrea pseudo-mas* var. *grandiceps*.

To Mr. Fitt, The Frythe Gardens, Welwyn, Herts, for *Lastrea pseudo-mas* var. *ramo-cristatum*.

To C. T. Druey, Esq., Forest Gate, Essex, for *Blechnum spicant* var. *concinnum*, and *B. s. var. ramo cristatum*.

To Mr. James Moly, Charnmouth, Devon, for *Polystichum angulare* var. *lineatum*, *P. a. var. cristato-gracile*, *P. a. var. latifolium*, *P. a. var. grandiceps*, and *Scolopendrium vulgare* var. *variegatum*.

To E. J. Lowe, Esq., F.R.S., Shirenewton Hall, Chepstow, for *Trichomanes radicans* var. *cristata*, *Polystichum angulare* var. *habellii-pinnulum* (of Wills), *P. a. var. coronare*, *P. a. var. rotundatum-cruciatum*, *P. aculeatum* var. *cruciatum*, *Scolopendrium vulgare* var. *mirum*, *S. v. var. adornatum*, *S. v. var. cicutum*, *Athyrium filix-femina* var. *mirandum*, and *A. f.-f. var. trossula*.

To Mrs. Grant, Hillesdon House, Collampton, Devon, for *Scolopendrium vulgare* var. *crispum variegatum* (of Grant).

To Mr. Moule, of Ilfracombe, for *Scolopendrium vulgare* var. *coronans*, *S. v. var. crispum fertile*, and *Cystopteris fragilis* var. *sempervirens cristata*.

To Mrs. Abbott, The Priory, Abbots Leigh, near Bristol, for *Polystichum angulare* var. *grandiceps* (of Abbott).

To E. F. Fox, Esq., Brislington, Bristol, for *Polystichum aculeatum* var. *corymbiferum*, *P. angulare* var. *congestum* *polydactylum*, and *P. aculeatum* var. *corymbiferum cruciatum*.

To Messrs. W. & J. Birkenhead, Sale, near Manchester, for *Cheilanthes Eatonii*, *C. gracillima*, *Notholaena Mullerii*, *N. Newberryi*, *Adiantum Fergusoni* and *Selaginella Oregana*.

To Messrs. F. W. & H. Stansfield, Sale, near Manchester, for *Athyrium filix-femina* var. *laciniosum*, *A. f.-f. var. congestum laciniosum-cristatum*, *A. f.-f. var. congestum-excurrens*, *A. f.-f. var. angustatum-congestum*, *A. f.-f. var. unco-glomeratum*, *A. f.-f. var. plumosum-divaricatum*, and *Polystichum angulare* var. *pulcherrimum*.

To Mr. J. M. Barnes, of Milnthorpe, Westmoreland, for *Polypodium vulgare* var. *multifido-elegantissimum*, *P. v. var. foliosum-cornubiense*, *P. v. var. bifido-grandiceps*; *Lastrea propinqua* var. *grandiceps*, *L. montana* var. *coronans*; *Athyrium filix-femina* var. *regale* (of Barnes), and *A. f.-f. plumosum* (of Barnes).

To Mr. Garnet, of Bowness, Windermere, for *Athyrium filix-femina* var. *setigerum-cristatum*.

To Mr. Gill, The Fernery, Lynton, Devon, for *Lastrea amula* var. *cristata*.

To W. C. Carbonell, Esq., of Usk, for *Polystichum angulare* var. *divisilobum-grandiceps*.

To E. J. Lowe, Esq., for *Dahlia Lily*, a hybrid between *White Queen* and *glabrata*, white and pointed petals, half the size of *White Queen*, and shape of a *Lily*. Small foliage.

### LEDGERY FRUIT SHOW.

OCTOBER 25.—This show was held in Ledgery Park, Herefordshire, the seat of M. Biddulph, Esq., M.P.; and as this place is situated in the centre of a large fruit-growing district a good show was naturally anticipated, no less than 3000 dishes of fruit were staged on tables placed within.

The success of the show is doubtless in great measure due to the support given to it by the resident gentry, coupled with the efforts of an energetic committee, whose liberality in the way of prizes was sufficient to attract the attention of eminent growers, as may be gathered from the fact of the following well-known names:—Messrs. Bunyard & Co., Maidstone; Messrs. Cranston & Co., Hereford; and Messrs. Widdows, Heckfield; Child, Croome Court; and Denning, Holm Lacey, appearing in the prize list subsequently.

Large and interesting collections of Apples and Pears were staged by Messrs. Veitch & Sons, Chelsea; Wheeler & Co., Gloucester; Paul & Son, Chesham; and by Mr. J. Watkins, of Pomona Farm, New Hereford. Mr. Wm. Coleman also sent a nice collection of Apples and Pears from the Eastnor Castle Gardens.

Excepting two classes for Grapes and two for Tomatoes, the rest were confined to dessert, culinary, and cider Apples, and dessert and perry-making Pears.

The awards of the judges were as follows:—

Class I, three bunches black Grapes, Mr. Davis, gr. to M. Biddulph, Esq., M.P., Ledgery Park, and Mr. Walter Child, gr. to the Earl of Coventry, were awarded equal 1st the former for excellent examples of Black Alicante, and the latter for beautifully finished Gros Colmar, rather small in berry and bunch; Mr. S. T. Wright being 2nd, with Gros Colmar; and Mr. J. Corbett, 3rd. Mr. Davies also had the best dish of White Muscats, very large tapering bunches.

As is customary the collection of Apples and Pears excited considerable interest amongst the growers present, and the principal prizetakers were:—Messrs. Bunyard & Co., Maidstone; Messrs. Cranston & Co., Hereford; Mr. J. Watkins, Withington, near Hereford; Mr. C. Denning, Mr. W. Wildsmith, Mr. Walter Child, Mr. S. T. Wright, and Mr. Davis.

Pears.—The following were the varieties shown and the number of dishes:—

Marie Louise, 22; Pitmaston Duchess, 16; Louise Bonne of Jersey, 12; Josephine de Malines, 6; stewing Pears, 22; Doyenné du Comice, 73.

At a conference which was held in an adjoining tent, and which was well attended, Mr. W. Coleman read an excellent paper on fruit-growing in that particular district.

## THE WEATHER.

### THE PAST WEEK.

The following summary record of the weather for the week ending Nov. 5, is furnished from the Meteorological Office:—

"The weather has been very dull and unsettled in all parts of the kingdom, with much rain over England, and a considerable quantity over Ireland and Scotland also. In the metropolis a dense black fog was experienced for a time on November 1, and again during the morning of the 3rd.

"The temperature has been above the mean in all districts; in 'England, N.E.,' 'England, S.,' and 'Scotland, W.,' the excess has been 3°, and in the other districts 1° or 2°. The highest of the maxima, which were generally recorded during the earlier days of the period, ranged from 53° in 'Scotland, N.,' to 59° in 'Scotland, W.,' 61° in the 'Channel Islands,' and 62° in 'Ireland, S.' The lowest of the minima were registered on the 1st, when they varied from 33° over Scotland to 38° in 'England, E.,' and 'England, N.W.,' and to 41° in the 'Channel Islands.'

"The rainfall has been rather less than the mean in 'Scotland, N., and 'Scotland, W., and about equal to it in 'Ireland, N., but in all other districts an excess is shown, especially over central and eastern England.

"Bright Sunshine shows a slight increase in the 'Grazing Districts,' and in the extreme north of 'Scotland,' but has again been very deficient generally. In most parts of England and Scotland, and also in the 'Channel Islands,' the percentage of the possible amount of duration has not exceeded 15; but in Ireland it has ranged from 25 to 28, while in 'Scotland, N.,' 38 per cent has been recorded."

#### MEAN TEMPERATURE OBSERVED AT CHISWICK DURING THE WEEK ENDING NOV. 17. (AVERAGE OF FORTY-FOUR YEARS.)

Nov. 11 ... ..	43° 1	Nov. 15 ... ..	42° 2
" 12 ... ..	42° 8	" 16 ... ..	43° 1
" 13 ... ..	42° 5	" 17 ... ..	42° 0
" 14 ... ..	42° 3	Mean for the week	42° 4

[Accumulated temperature indicates the combined amount and duration of the excess or defect of temperature above or below 59° F. for the period named, and is expressed in Day-degrees—a "Day-degree" signifying 1° continued for twenty-four hours, or any other number of degrees for an inversely proportional number of hours.]

## MARKETS.

### COVENT GARDEN, November 8.

[We cannot accept any editorial responsibility for the subjoined reports, which, however, are furnished to us regularly every Thursday, by the kindness of several of the principal salesmen, who revise the list, and who are responsible for the quotations. It must be remembered that these quotations represent averages for the week preceding the date of our report. The prices depend upon the quality of the samples, the supply in the market, and they fluctuate, not only from day to day, but often several times in one day, and therefore the prices quoted as averages for the past week must not be taken as indicating the particular prices at any particular date, and still less can they be taken as guides to the prices in the coming week. Ed.]

## SEEDS.

LONDON: Nov. 7.—Messrs. John Shaw & Sons, seed merchants, of 37, Mark Lane, E.C., write that the seed market to-day was thinly attended, with scarcely any business doing. The most favoured article of late has been fine French Red Clover seed. Alsike, white, and Trefoil, all keep steady. For Winter Tares lower prices are accepted. There is no change in either Perennial or Italian Rye-grass. Choice blue Peas continue scarce, and command full rates. For Haricot Beans the tendency is still upwards; supply continues very short. Bird seeds are slow of sale. Feeding Linseed is firm.

## CORN.

Averages.—Official statement showing the average price of British corn, imperial measure, in the week ended November 3.—Wheat, 32s. 3d.; Barley, 23s. 10d.; Oats, 15s. 5d. For the corresponding week in 1887.—Wheat, 30s. 3d.; Barley, 23s. 7d.; Oats, 15s. 11d.

## FRUIT AND VEGETABLES.

SPIITALFIELDS: Nov. 7.—Fairly good supplies of all kinds of fresh vegetables, Apples, Pears, Potatoes,

&c. Trade rather slow at following rates:—Fruit: Pears, 3s. to 4s. 6d. per bushel; Apples, 3s. to 5s. 6d. do.; do., 1s. 9d. to 2s. 9d. per half-bushel; English Tomatoes, 3s. 6d. to 5s. per peck; American Apples, 8s. to 13s. per barrel. Vegetables: Brussels Sprouts, 1s. 6d. per half-sieve; Savoy, 2s. to 3s. per tally; Cabbages, 1s. 9d. to 2s. do.; Cauliflowers, 2s. to 3s. 6d. do.; Greens, 1s. 6d. to 2s. per dozen bunches; Turnips, 1s. 9d. to 2s. do.; Carrots, 1s. 9d. to 2s. do.; Beetroot, 2s. to 2s. 6d. do.; Onions, 1s. 9d. to 2s. do.; Mint, 1s. to 1s. 6d. do.; Parsley, 2s. to 3s. do.; Celery, 4s. 6d. to 10s. per dozen bunches; Horseradish, 10d. to 1s. 4d. per bundle; Spanish Onions, 7s. 6d. to 9s. per box; Belgian Onions, 2s. 3d. to 2s. 6d. per bag; Dutch Onions, 2s. to 2s. 6d. do.; pickling Onions, 4s. to 4s. 6d. do.; frame Cucumbers, 4s. to 5s. per dozen; Endive, 1s. to 1s. 6d. do.; Cos Lettuce, 4d. to 6d. per score; Carrots, 2s. to 3s. per ton.

STRAFORD, Nov. 6.—Supply has been good during the past week, and a brisk trade was done at the following prices:—Cabbages, 2s. 6d. to 3s. 6d. per tally; Savoy, 3s. to 4s. do.; Turnips, 30s. to 40s. per ton; Carrots, household, 35s. to 40s. do.; Mangels, 14s. to 21s. do.; Swedes, 16s. to 22s. do.; Onions, Dutch, 2s. 6d. to 3s. per bag; do. Bordeaux, 7s. to 9s. per case; Apples, English, 2s. 9d. to 6s. 6d. per bushel; Watercress, 6d. per dozen; Celery, 10d. to 1s. per roll; Cauliflowers, 4s. to 6s. per tally; Brussels Sprouts, 2s. to 2s. 6d. per half-sieve; Carrots, 2s. to 3s. per dozen bunches; Turnips 2s. to 3s. 6d. do.; Walnuts, 6s. to 12s. 6d. per bag; do., 12s. 6d. to 16s. per sack.

## POTATOS.

BOROUGH AND SPIITALFIELDS: Nov. 8.—The wet weather has some extent checked supplies at market, and best samples are firmer. Regents, Scotch, 80s. to 95s.; English, 65s. to 90s.; Hebrons, 60s. to 110s.; Magnum Bonums, 60s. to 100s. per ton.

SPIITALFIELDS: Nov. 7.—Quotations:—Magnums, 60s. to 80s.; Imperators, 65s. to 85s.; Champions, 60s. to 65s.; Regents, 70s. to 90s.; Beauty of Hebron, 85s. to 100s. per ton.

STRAFORD: Nov. 6.—Quotations:—Light Magnums, 65s. to 85s.; do., 60s. to 70s.; Hebrons, 55s. to 70s.; White Elephants, 60s. to 90s. per ton.

Imports.—8 bags from Antwerp, 2 bags 15 sacks from Ostend, 26 baskets 12 bags from Rotterdam, 1419 bags from Hamburg, and 23 packages from Flushing.

## HAY.

Averages.—The following are the averages of the prices obtained at the various metropolitan markets during the past week:—Clover, prime, old, 120s. to 142s.; new, 80s. to 110s.; inferior, 45s. to 75s.; prime meadow hay, 120s. to 130s.; good new hay, 80s. to 100s.; inferior, 30s. to 70s.; old straw, 42s. to 48s.; new, 30s. to 44s. per load.

## ENQUIRIES.

"He that questioneth much shall learn much."—BACON.

ANALYSIS OF SOIL.—I take the liberty of forwarding to you a report of an analysis of a sample of soil, and should be glad of the opinions of some of your correspondents as to the suitability of that soil for Vines:—

Mechanical Analysis.		
Moisture ... ..	4.5	
Organic matter and water of combination ...	13.275	
Lime ... ..	2.025	
Coarse sand ... ..	33.16	
Fine sand and clay, principally fine sand ...	47.04	
	100.000	
Chemical Analysis.		
Moisture ... ..	4.5

W. M. [Deficient in potash. Ed.]

SPECIMEN APPLES.—What English Apple has a heavier weight on record than the one of Warner's King exhibited by me at Leebury on October 25 last? The report of that exhibition gave this specimen as weighing over 2 lb., and it was awarded the prize for the largest Apple. (Class 31 of schedule, prize 21s.). Robert Smith.

## NOTICES TO CORRESPONDENTS.

INTELLIGENT READERS, do please note that letters relating to ADVERTISEMENTS, or to the supply of the Paper, should be addressed to the PUBLISHER, and that all communications intended for publication, as well as specimens and plants for naming, should be addressed to the EDITOR. Such communications should be written on one side only of the paper, and sent as early in the week as possible. Correspondents sending newspapers should be careful to mark the paragraphs they wish the Editor to see.

BOOKS: *W. H. D. Chemistry of the Farm*, by R. Warrington, is the best book for you, published by Messrs. Bradbury Agnew & Co., Boulevard Street, London, E.C. There is no book, so far as we know, which treats of the analyses of fruits and vegetables.—*E. M. The British Moss Flora* is published by the author, R. Braithwaite, 303, Clapham Road, S.W.

CHRYSANTHEMUMS: *A. C.* Nice well-formed flowers, but not better than others already in commerce.

EMBOSSED ROSE LABELS: *Mr. Rogers*. You would be able to get these labels from any large horticultural sundriesman.

GALLS ON SPURGE: *G. B.* The galls are produced by *Chermes Abietis*. There is no available remedy but to burn all the galls in the young state.

GARDEN-WALK SCRAPER AND BROOM: *M. H. S.* Any ironmonger will supply you with a wheeled hoe or scraper, but we know of no implement combining a scraper and broom.

GRAPES: *E. J. L.* The Vines have been greatly mismanaged. The splitting of the berries was the result of mildew attacking them, which prevented further growth in the skin of the berry. We have never remarked a worse case, and it is evident the man does not know anything about the treatment of the Vine.

MARECHAL NIEL ROSE ON ROOF: *Poor Georgie*. Your Rose will bloom well enough if you thin out the weaker shoots, cutting clean away to the old wood. Do not spare the knife, but so cut these away that the stronger Willow-like shoots stand a foot or more apart; and do not cut the latter at all. From the points of these you will get your earliest blooms next season. By cutting out as we advise you will be enabled to use the ventilators at the back of the house, and more light will fall on the plants beneath the Rose.

NAMES OF FRUIT: *W. W.* 1 and 4, *Beurré Rance*; 2, *Nouveau Poitean*; 3, *Van Mons Léon Leclerc*; 5, *Beurré Hardy*; 6, *Duchesse d'Angoulême*; 7, *Doyenné Gris*; 8, *Winter Nelis*; 9 and 13, *Beurré Diel*; 10, *Chamaunelle*; 11, *Beurré Capiaumont*; 12, *Jersey Gratioli*; 14 and 15, wild seedling.—*W. Fisher*. 1, *Warner's King*; 2, *Hardthornden*; 3, *Walham Abbey Seedling*. *A Weekly Subscriber*. 1, *Passe Colmar*; 2, *Duchesse d'Angoulême*; 3, *Chamaunelle*; 4, *Doyenné Gris*.—*Thomas Matheson*. Pear *Vicar of Winkfield*.—*Notts*. 1, *Jersey Gratioli*; 2, *rotten*; 3, *Fondante d'Autonne*; 4, *Beurré Superfin*.—*J. Earl*. 1, *Belle de Bruxelles*; 2, *Chamaunelle*; 3, *Doyenné Bouschoch*.—*N. N. P.* Apple *Hanwell Souaring*.—*A. B.* 1, *Aston Town*; 2, *Autumn Bergamot*.—*Hexham*. Apple *Glória Mundi*.—*R. Ridley*. Apple *Brabant Bellefleur*.—*W. & H. Brown*. 1, *Pitmasdon Duches*; 2, *Marie Louise d'Uccle*; 3, *Bowwood*; 4, *Hambleton Deux ans*.—*Wootton*. There was found no letter; we prefer the letter to be enclosed in the box, and not sent separately, as it is sometimes difficult to identify the package to which the letter relates. 1, *Beauty of Kent*; 2, *New Hawthornden*; 3, *Royal Somerset*; 4, *Hanwell Souaring*; 5, *Hambleton Deux ans*; 6, *Emille d'Héyst*.

NAMES OF PLANTS: *J. Mantin*. The name of Orchid omitted in our last issue is *Saccolabium calceolare*, probably.—*F. H., Manchester*. The two plants you send without numbers are *Restiaceous* plants from South Africa, now coming into use for the same decorative purposes as *Pampas* and other grasses. The one with the blunt spikelets is *Thamnochortus gracilis*; the other is *T. elongatus*. The two *Heaths* we hope to name next week.—*G. W.* Aster *Townshendi*; *Helenium autumnale*, yellow.—*R. A. G.* 1 and 2, fruits next week; 3, *Scirpus lacustris*; 4, *Typha latifolia*; 5, *Antennaria tomentosa*; 6 *Acalypha Mafraeana*;

7, not found; 8, *Acalypha musaca*.—*R. L.* 1, *Aster Reevesii*; 2, *Francoa sonchifolia*; 3 and 4, *Davallia dissecta*, probably—both barren fronds, send fertile one; 5, *Pteris scaberula*; 6, *Adiantum hispidulum*.—*Camjee*. *Lockhartia acuta*.—*A. O. W.* *Dianthus Seguerii*.—*N. B.* 1, *Dendrobium bigibbum*; 2, *Oncidium tigrinum*; 3, *O. verucosum*; 4, *O. flexuosum*.—*H. C.* 1, *Salix fragilis*; 2, *S. Smithiana*; 3, *S. aquatica (cinerea)*; 4, *S. caprea*.

REPORT OF THE APPLE CONGRESS, 1884: *W. Jordan*. It is out of print.

TOMATOS AUTOCRAT, PRIZE BELLE, AND THE QUEEN: *R.* The only variety mentioned in any of the American lists of late date is *The Queen*. It is a yellow fruit of great excellence in America.

Correspondents sending plants or fruits to be named, or asking questions demanding time and research for their solution, must not expect to obtain an answer to their enquiries in the current week.

## THE PINE FORESTS OF WESTERN FRANCE.—

In a report on the agriculture of the Gironde, the British Consul at Bordeaux refers to the forests which cover about a third of the department, especially the Landes district, where the soil is wholly unfitted for ordinary cultivation. Hence forests of Pines (the *pin maritime*) have in recent times been planted, and the wood and resin obtained from them have now become an important end, in some instances, the sole source of revenue of the inhabitants of those districts. In the parts distant from towns and other inhabited places resin is chiefly produced, while in places nearer to Bordeaux or other shipping ports, where means of transportation exist, the production of pit props, railway sleepers, telegraph poles, and wood for fuel forms the chief business. The collection of resin affords a living to a large number of the very poorest persons, and the recent decline in the exportation of this article from Bordeaux has been a great misfortune to the inhabitants of some parts of the Landes district. The decline has been caused by the annually increasing competition of the United States, which has become the chief exporter of resin to the almost entire exclusion of Bordeaux. A new kind of oil, called Pine-oil, is now made from the refuse of resin after the latter has been employed in making turpentine. This is used as an illuminant in some private houses in Bordeaux, and burns very brightly; it is cheaper than refined petroleum, and is not explosive. The trees do not appear to suffer by the extraction of the resin, if it is done carefully, and the wood is even better fitted then for certain purposes, such as paper-making and the manufacture of pyroligneous acids, than it was before. The export of pit props made from the Landes Pines is an important branch of trade between Bordeaux and English ports adjacent to coal districts. One hundred and seventy-five thousand tons of pit props are now shipped annually to England from Bordeaux, while ten years ago the shipments did not reach half that quantity. Railway sleepers and telegraph poles are likewise made in large quantities in these Pine forests; they are used chiefly in France. Besides, a large quantity of young Pines finds its way to England every year to be converted into paper. The Landes is a sandy district in which nothing but Pines will grow, and the forests are all of recent origin.

## SAVE HALF THE COST.

GARSIDE'S  
BEDFORDSHIRE  
SILVER SAND,  
Coarse and Fine

Is admitted by the leading Nurserymen to be the Best Quality obtainable in the Trade. J. & Co. is by far the best they have ever used. Samples can be seen at above address, or forwarded on application free of charge.

HUGHES' Soluble  
FIR TREE OIL

FLORISTS AND NURSERYMEN SHOULD NOT  
BE WITHOUT IT.

Unsurpassed as an insecticide, it kills effectually all parasites and insects which injure plants whether at the roots or on the foliage, without injury to tender plants, such as ferns, &c. If used as directed. Used as a WASH it imparts the gloss and lustre to the foliage which is so desirable on exhibition specimens.

Dog Fanciers should not be without it! It makes a silky Coat and produces healthy Skin Action; kills fleas, and is excellent for washing dogs.

Housewives should not be without it! Used with ordinary household soap it is an effectual DISINFECTANT, BLEACHER, & CLEANER OF FABRICS. It kills insect life on man, animal, or plant, without injury to the skin, wherever parasites may appear.

Sold by Seedsmen and Chemists, 1s. 6d., 2s. 6d., & 4s. 6d.; 2 gallon tins, 6s., 1 gallon 12s. 6d., or less in larger quantities.

A treatise on FIR TREE OIL, as an INSECTICIDE, its application to Plants and Animals, sent Post free on receipt of address, by the Manufacturer,

E. GRIFFITHS HUGHES, Manchester.

Wholesale from all the London Seed Merchants, and Patent Medicine Houses.

## THE LOUGHBOROUGH GREENHOUSE HOT-WATER APPARATUS.

This is the simplest, cheapest, and most powerful apparatus made. It requires no brick setting, no stove-hole, and no hot-water filter for fixing. The Boiler stands in the Greenhouse, the front only being outside, so that the whole of the heat from the Boiler itself is utilised. It burns over twelve hours without attention, at a nominal cost.

Cost of apparatus complete for Greenhouses at below, delivered free, with pipes cut and fitted ready for fixing.

### Estate Sales.

The best County medium for Advertising Sales of  
Estates is

**THE WORCESTER HERALD**, the largest  
and leading County Paper. Extensive circulation giving  
the upper and middle classes in Worcestershire and adjoining  
counties. Advertisers would do well to forward for reference  
and distribution, plans and particulars of Estates, Catalogues  
of Machinery, Furniture, Books, and other property advertised  
in the columns of the Worcester Herald. Specimen copies sent  
free. Published Friday for Saturday, price 2d.

Offices, 72, High Street, Worcester.

### Sales of Stock and Agricultural Effects.

**THE WORCESTER HERALD** is the most  
effective organ for giving publicity to announcements of  
this class. It is the largest and leading Agricultural paper in  
the country, and circulates most extensively among Agricul-  
turalists in and around Worcestershire. Specimen copies free.  
Published Friday for Saturday, price 2d.

Offices, 72, High Street, Worcester.

### Farms to be Let.

LAND AGENTS, ESTATE MANAGERS, and all having Farms  
to let, do well to Advertise in

**THE WORCESTER HERALD**, the Largest  
and Leading County Paper. Specially adapted for  
bringing such notices before Tenant Farmers. Large Circula-  
tion, moderate charge. Specimen free. Price 2d. Published  
Friday for Saturday.

Offices, 72, High Street, Worcester.

Trade in Lancashire. One accustomed to Travel.—  
Apply, with particulars, to Box C, *Gardeners' Chronicle*  
Office, 41, Wellington Street, Strand, W. C.

**WANTED, a MAN**, used to London Furnish-  
ing, and to make himself generally useful.—State  
abilities and wages required to G. S. *Gardeners' Chronicle*  
Office, 41, Wellington Street, Strand, W. C.

### WANT PLACES.

**B. S. WILLIAMS** begs to intimate that he  
has at present in the Nursery and upon his Register  
some excellent Men, competent either to fill the situation of  
HEAD GARDENER, BAILIFF, FOREMAN, or JOURNEYMAN.  
Ladies and Gentlemen requiring any of the above will  
please send full particulars, when the best selections for the  
different capacities will be made.—Holloway, N.

**J. AND R. THYNE, NURSEYMEN**, Glasgow,  
can always RECOMMEND MEN of known character  
and ability as GARDENERS to any Lady or Gentleman re-  
quiring such. Applications solicited.

**RICHARD SMITH AND CO.**  
beg to announce that they are constantly receiving  
applications from Gardeners, seeking situations, and that they  
will be able to supply any Lady or Gentleman with particulars,  
&c.—St. John's Nurseries, Worcester.

**SCOTCH GARDENERS.**  
—JOHN DOWIE (of the late firm of Downie & Laird),  
Seedman, 144, Princes Street, Edinburgh, has at present on  
his List a number of SCOTCH GARDENERS, waiting re-  
engagement. He will be pleased to supply full particulars  
to any Lady, Nobleman, or Gentleman requiring a trustworthy  
and competent Gardener.

**UNDER GARDENERS.**—Several strong  
well-trained young Scotchmen, anxious to find situa-  
tions in England.—Particulars from M. Keith & Co.,  
Advertising Agents, Edinburgh.

**GARDENER (HEAD)**, age 30, married, when  
sued.—D. MACKAY, Gardener to the Right Hon. Sir  
Massey Lopes, Bart., can with confidence recommend his Fore-  
man, E. DAVE, to any Lady or Gentleman requiring a  
thoroughly practical good Gardener. Fifteen years' practical  
experience.—Maristow, Bolorough, Devon.

**GARDENER (HEAD)**,—Age 36, married, two  
children; thoroughly experienced in all branches.  
First-class references. Two years in last place.—W. HOLD-  
CROFT, Barton, near Burton-on-Trent.

**GARDENER (HEAD)**, age 38, married.  
—HENRY GRAY, for the last nine-and-a-half years  
Gardener to Griffith Thomas, Esq., Park House, Englefield  
Green, Staines, is open to a re-engagement. Death of employer  
cause of leaving.—Address as above.

**GARDENER (HEAD)**, age 48.—J. J.  
DAUCHEY, for nineteen years Gardener to the late  
J. Bramston Stans, Esq., Buckfield Park, is now at liberty to  
offer his services to any Lady or Gentleman requiring a  
thorough practical man. Death cause of leaving.—24, Grosvenor  
Terrace, Grosvenor Park, Camberwell, S. E.

**GARDENER (HEAD)**,—Age 35, married;  
twenty years' practical experience in Early and Late  
Forcing of Fruit, Flowers, and Vegetables, the Cultivation of  
Roses, Tree and Standard Fruit, Ornamentals, &c.; also Kitchen  
Gardens and Pleasure Grounds. Good character.—J. FINLAY-  
SON, The Gardens, Combe Bank, Sevenoaks.

**GARDENER (HEAD)**,—Age 36, married;  
thoroughly experienced in Early and Late Forcing of  
Fruit, Flowers, and Vegetables; also Flower and Kitchen  
Gardening. Four years in last place as Head. Excellent  
character and testimonials.—J. B., The Cottage, Holland's Road,  
Teignmouth, Devon.

**GARDENER (HEAD)**, age 34.—Mrs. ANDER-  
SON, Waverley Abbey, Farnham, Surrey, wishes to  
recommence her late Head Gardener (who was with her for  
nearly seven years) to any Lady or Gentleman requiring a  
good practical Gardener. Twenty years' experience in large  
establishments.—S. F., Upper Shore, Gravesend, Kent.

**GARDENER (HEAD)**, where another is kept.  
Age 28, married, no family; sixteen years' experience  
in the general routine of Gardening. Can have excellent  
character from present situation. Suburbs of London preferred.  
—J. THURGOOD, The Lodge, Loudwater House, Rickmans-  
worth, Herts.

**GARDENER (HEAD WORKING)**, where three  
or four are kept.—Age 32, single; fifteen years' practical  
experience. Eight years' good character.—T. R., 18,  
Villiers Street, East Street, Oldham, Lancashire.

**GARDENER (HEAD WORKING)**, where one  
or more are kept.—Age 40, married; thoroughly ex-  
perienced in all branches. Good character from present em-  
ployer.—C. B., Lawn Gardens, Swindon.

**GARDENER (HEAD WORKING)**,—Age 29,  
married; twelve years' thorough experience in Growing  
of Fruit, Flowers, and Vegetables. Can be well recom-  
mended by last employer.—J. D., 82, Harwood Street, Kenilworth  
Town, London, N. W.

**GARDENER (HEAD WORKING)**,—Age 29,  
married; abstinence; thoroughly experienced in Flowers,  
Fruit, and Vegetables. Thoroughly experienced in First-class  
personal character.—J. E., Garden Cottage, St. Peter's Street,  
Tunbridge Wells.

**GARDENER (HEAD WORKING)**, where one  
or two others are kept.—Age 46, married; thirty years'  
experience. Understands Vines, Greenhouse, Flower and  
Kitchen Gardening. Can have twenty years' good character  
from present employer.—GARDNER, Trafalgar, Salisbury.

**GARDENER (HEAD WORKING)**, where  
several are kept.—Age 43, married, no family; thor-  
oughly practical in all branches of Gardening. Fifteen years'  
experience where Gardening has been well done. Land and Stock.  
Good character from last and previous employers.—A. B., 4,  
Thornton Road, Potter's Bar.

**GARDENER (HEAD WORKING)**, Scotch.—  
Age 28, single at present; fourteen years' practical  
knowledge in all branches. Six years' English experience.  
Character and ability will bear strictest investigation from  
present and previous employers.—D. BROWN, 12, Church  
Walk, Kensington, W.

**GARDENER**—General DESBON, Bath-  
ampton House, Bath, wishes to recommend his Gardener.  
Understands Vines, Melons, Cucumbers, and General routine.—  
E. PERKINS, Almondsbury, Gloucestershire.

**GARDENER (SINGLE-HANDED)**,—Age 26,  
married; two and a half years in present situation. Good  
experience indoors and out. Leaving through death.—J.  
PERKINS, Park House, Englefield Green.

**GARDENER (SECOND)**, where three or four  
are kept.—Age 24; good character.—F. LANCASTER,  
Kelsey Manor, Beckenham.

**GARDENER (UNDER)**, as SECOND in the  
Houses, and Outdoor Work occasionally if required.—  
Been accustomed to Vine and Plant Culture. Good references.  
—W. BUSH, Golding Hill, Loughton, Essex.

**GARDENER (UNDER)**, in a Gentleman's  
Garden.—Age 22; seven years' experience inside and  
out. Good character.—T. POCOCK, 81, Lots Road, Chel-  
sea, S. W.

**GARDENER (UNDER)**, age 22.—C. GOLD-  
SMITH, Kelsey Manor Gardens, Beckenham, can with  
confidence recommend a steady, sober, and trustworthy young  
man for the Kitchen Gardens. Leaving through no fault.  
—Apply as above.

**FOREMAN**, in a good establishment.—  
Age 30; highly recommended as to character and ability  
in all branches, Furnishing included.—J. D., 24, Brynmaer  
Road, Battersea Park, London, S. W.

#### Trade.

**FOREMAN (WORKING)**,—Thorough ex-  
perience in all branches. First-class Wreaths, &c. Good  
Salesman. Excellent references.—M., 9, Grove Place, Acton, W.

**FOREMAN, or SECOND**,—Age 27, married;  
thirteen years' experience. Well recommended from all  
previous employers.—FOREMAN, 4, Doveclade Place, Pinner  
Road, Sudbury, Harrow, N. W.

**FOREMAN PROPAGATOR AND GROWER**,  
thorough.—Twenty years' experience in General Nursery  
Trade. Good at Bouquets, Wreaths, &c.—T. S., Mr. Hamilton,  
Seedsmans, 3, Henry Street, Dublin.

#### To Nurserymen.

**FOREMAN PROPAGATOR AND GROWER**.  
Thoroughly well-up in Propagating and Growing of  
Roses, Trees, Rhododendrons, Conifers, Clematis, Bouvardias,  
Poinsettias, Carnations, Double Primulas, and general Hard  
and Soft-wooded Plants, Bedding Stuff, &c.; efficient at  
Wreaths, Bouquets, &c.—FOREMAN, 41, Wellington Street,  
Strand, W. C.

**JOURNEYMAN, Indoors**.—Young; five years'  
good character.—J. SMITH, The Gardens, Newstead  
Abbey, Notts.

**JOURNEYMAN, in the Houses**.—Age 20;  
six years' experience. Two-and-a-half years' good cha-  
racter from last situation.—W. DAVEY, Alington, Exeter.

**JOURNEYMAN, in the Houses**.—Age 22;  
seven years' experience. Four-and-a-half years in present  
place. Good character.—J. HENSGOUGH, The Gardens,  
Sugnal Hall, Eccleshall, Staffordshire.

**JOURNEYMAN, Inside and Out**, in a good  
Private Garden.—Age 21; five years' experience in the  
profession. Good references.—W. G. BOND, Broomfield,  
Chelmsford, Essex.

**JOURNEYMAN, Inside or Out**.—Age 20;  
five years' good character from present situation. In-  
dustrious and obliging.—W. H., Moreton Gardens, Bideford,  
Devon.

**JOURNEYMAN, in the Houses**, age 22.—  
J. MILSON, Gardener to the Right Hon. Sir Harry  
Verney, Bart., will be pleased to recommend a young man as  
above. Five years' good character.—Claydon Gardens, Winslow,  
Bucks.

Good knowledge of Trade, especially Seed and Bulb  
Departments, Office routine, &c. Eight years' experience;  
well up in large London business. Willing to assist in any  
department. First-class references.—M., *Gardeners' Chronicle*  
Office, 41, Wellington Street, Strand, W. C.

#### Seed Trade.

**SHOP ASSISTANT**.—Age 19; five and  
a half years' experience with a leading Firm. Good  
references.—F. B., 81, Hazlewood Road, Walthamstow.

**TO FLORISTS**.—Wanted by, experienced  
young Lady, situation in Florist's shops, London or  
Suburbs. High-class references.—D. S. B., *Gardeners' Chronicle*  
Office, 41, Wellington Street, Strand, W. C.

**HOLLOWAY'S PILLS**.—Nervousness and  
want of Energy.—When first the nerves feel unstrung,  
and listlessne's supplants energy, it is the right time to take  
some alterative, as Holloway's Pills, to prevent disorder running  
into disease. These excellent Pills correct all irregularities and  
weakness. They act so kindly, yet so energetically on the func-  
tions of digestion and assimilation, that the whole body is re-  
vived, the blood is rendered richer and purer, the muscles  
become firmer and stronger, and the nervous and absorbent  
systems are invigorated. These Pills are a suitable for all classes  
and all ages. They have a most marvellous effect on persons  
who are out of condition; they soon rectify whatever is in fault,  
restore strength to the body and confidence to the mind.

# SANDER & CO.

## CYPRIPEDIUM ELLIOTTIANUM, n. sp.

This is the nearest ally of *Cypripedium Rothschildianum*. Its remarkable leaves are broader, apparently stiffer. The spikes at hand are two-flowered — Mr. J. Godseff, however, has seen them with five. The primary peduncle would appear to be much stronger, as in the named species; it is reddish and covered with very short hairs. The fine bracts are those of *Cypripedium Rothschildianum*, yet white with red dark purple longitudinal stripes. Ovaries white, with red ribs. Both sepals white, with dark red longitudinal stripes. Petals longer by one-third, with dense, short, blackish ciliae, undulate at base, white, full of Indian purple stripes and freckles, free of them at apicular end. Lip's fashion that of *Cypripedium Stonei*; colour reddish-brown. Staminode angulate, both shanks finally contiguous, well bifid at apex, hairy at major part. The best mark of distinction is the sharp bifid apicular part of staminode. I have the impression the colours are much richer, the flowers greater, the peduncle stronger, the leaves broader and stiffer. This exceedingly elegant, surprising species is dedicated to Mr. Elliott, of the firm of Young & Elliott, at New York, at the suggestion of Mr. J. Godseff, who knows the absent Mr. Sander's views. What success of the firm to have imported in so short time *Cypripedium Sanderianum*, *Rothschildianum*, and *Elliottianum*!

H. G. RCHB., F.

"Gardeners' Chronicle," November 3.  
*CYPRIPEDIUM ELLIOTTIANUM*, n. sp.

"This glorious new introduction of Messrs. Sander & Co.'s, from the Philippines is now in bloom at the St. Albans Nursery. The plant is of noble habit, resembling *C. Stonei*; leaves bright green, from 1 foot to 15 inches long, and  $1\frac{1}{2}$  to 2 in. broad; the older stout purple-dotted scape, over 1 foot in height, bore evidence of the presence of five flowers, but on that in bloom only two. The bracts are spatheaceous, and very showy, from  $1\frac{1}{2}$  inch long, whitish, with narrow chocolate lines. The 2-inch long ovaries bear handsome flowers, which call to mind the beautiful *C. Rothschildianum* and *C. praestans*, from both of which, however, it is widely distinguished. The dorsal sepal is  $1\frac{1}{2}$  inch wide and  $2\frac{1}{2}$  long, pointed, ivory-white, with fifteen dark crimson lines of various lengths; the lower sepals are similar, but smaller. The lip is nearly like that of *C. Stonei* in colour and shape, and has the same fold on the under side; ivory-white, delicately veined and tinted rose. The petals are also white, spotted in the upper portion with crimson blotches, which run into three or four narrow lines to the points, the upper portions being wavy and ciliated, much as in *C. Sanderianum*. The staminode (unless abnormal) is narrow and curved under, as in *C. Rothschildianum*. Altogether it is a very beautiful species, which seems to embody the good features of most of its section. *James O'Brien*."

"Garden," November 3.  
*CYPRIPEDIUM ELLIOTTIANUM*.

"This is the name of a grand new species of Slipper Orchid imported from the Philippines, by Mr. Sander, of St. Albans, and which opened its flowers in the case on its journey home, so that we are able to judge of its great beauty and distinctness. The collector says he has seen it with five flowers on a scape; so here is another grand beauty to add to our collection of these deservedly popular Slipper Orchids. It is a bold-growing species, the leaves being two-ranked, 18 inches long by 2 inches broad, with one obtuse apex, deep green and leathery in texture. Scape erect, bearing five flowers, which, judging from those opened in the case during the journey home, are very large; the upper and lower sepals are large, ovate, and pure white, bandled with distinct lines of rich chocolate, which extend from base to apex; the petals are broad at the base, lengthened into tail-like points. In the specimen before me they are about 4 inches long, but these delicate members have been injured in their confinement, and, I should imagine, it will prove to be one of the longest-tailed of the Eastern kinds; the colour is pure white, marked at the base with large spots and blotches of chocolate; lip somewhat in shape like that of *C. Stonei*, pure white beneath, suffused and netted with rose in front, the upper edge being yellow. The staminode is very peculiar, being bent down like a large bird's beak, bifid at the apex, with thick, mossy, chocolate hairs. The bracts on the scape are large, streaked with chocolate, like the dorsal sepal. It is a grand addition to our cultivated *Cypripediums*, and should have a great future before it."

"W. H. C."

## CYPRIPEDIUM ELLIOTTIANUM, Rchb. f.

MESSRS. PROTHEROE AND MORRIS will SELL by AUCTION, at the Central Sale Rooms, 67 and 68, Cheapside, E.C., on FRIDAY, November 16, by direction of Mr. F. SANDER, St. Albans, the entire importation, consisting of nearly 1000 Plants of this extremely magnificent CYPRIPEDIUM. See p. 526 for full particulars.

## Barnet, N.

By order of the Court of Chancery. Cornwall v. Cornwall.

**SALE** of the old-established NURSERY BUSINESS as a going concern, and also about 6 acres of FREEHOLD and COPYHOLD LAND.

**MESSRS. PROTHEROE AND MORRIS** are instructed to **SELL** by AUCTION, at the Mart, Tottenham Yard, London, E.C., on FRIDAY, November 30, at 2 o'clock precisely, the following properties:—

Lot 1.—The old-established NURSERY, SEED, and FLORISTS' BUSINESS, known as the HADLEY NURSERY, Barnet, N., occupying a good position in the best part of the High Street, within eight minutes' walk of the High Barnet Railway Station. The Property comprises about 10 acres of Ground, with eight Greenhouses, Dwelling-house, and Seed Shop, the whole held for an unexpired term of about fifteen years at the moderate rental of £265 per annum. The Goodwill of the Business carried on for so many years will be included in this lot.

Lot 2.—About 6 acres of valuable FREEHOLD and COPYHOLD BUILDING or NURSERY LAND, known as the COMMON NURSERY, Barnet Common, possessing long frontages to the main road, and to Union Lane in the rear.

Lot 3.—Two acres of LAND, opposite Lot 2, held at £7 per annum.

This Sale offers an unusual opportunity for any one desirous of embarking into the Nursery Business. The whole of the STOCK and Tools will be sold by Auction, and the Purchasers to secure only such stock as may be required for carrying on the business at unreserved auction prices.

Particulars and Conditions of Sale may be had on the Premises, of Messrs. H. and J. Pyrie, Esq., 12, Old Broad Street, E.C.; and at Barnet, Herts.; or of Messrs. MONTAGU SCOTT and BAKER, Solicitors, 10, Gray's Inn Square, W.C., and Hatfield; and of the Auctioneers, 67 and 68, Cheapside, London, E.C., and Leytonstone, E.

## Friday, December 7.

COLLYER**, Cart House Lane Nursery, Woking Station, Surrey.

## CHRYSANTHEMUMS

AT THE NATIONAL GREAT SHOW last week we were awarded the highest honours, "The Society's Silver-gilt Medal."

It is remarkable that the greater proportion of first prizes went to Kent, and from whence nearly all the best blooms came.

What is even more remarkable, of the many thousands of growers from all parts of Europe whom we have had the pleasure of supplying, not a complaint was heard; all was praise and gratitude for the fine, fresh, stout, clean cuttings and plants which carried them to victory. Send for ours, the best Illustrated and Descriptive CATALOGUE—post-free.

**H. CANNELL & SONS,**  
 Swanley, Kent.

## ROSES—20 ACRES,

Well-rooted, many-shooted, truly named, of matured vigorous growth, and of the best kinds. Bushes, R. S. & Co.'s selection, 8s. per dozen; 60s. per 100. Packing and carriage free for cash with order.

These World-famed ROSES cannot fail to give the greatest satisfaction.

Nov. 17, 1888.

# SPECIAL ISSUE OF 25,000 SHARES

Of £1 each, payable, 2s on application, 3s. on allotment, 5s. one month thereafter, and the balance of 10s. per share, if required, in Calls of not more than 5s. each, of which at least two months' notice will be given; but subscribers may pay up in full on allotment, if they so desire, with full participation in profits in proportion to the amount paid.

ONLY 10/- PER SHARE HAS BEEN CALLED UP ON FIRST ISSUE.

Applications will be received on and after MONDAY, up to 4 p.m. THURSDAY, November 22.

Three-fourths of the purchase money is in Vendors' Shares, which do not rank for Dividend until a Dividend of 10 per Cent. has been paid on the Ordinary Shares now offered for subscription.

Registered, and in operation since May, 1888. Incorporated under the Companies' Acts 1862 to 1886, whereby the liability of each Shareholder is limited to the amount remaining unpaid on his Shares.

## THE SPHINCTER GRIP

## ARMOURD HOSE COMPY. (LIMITED).

During the few months in which these Hoses have been offered in England, so great has been the demand that, with existing plant and resources, it has been found difficult to keep the market supplied; and the trade now being done shows a considerable margin of profit. Orders for this Hose are daily received by the Company, which are now being executed as rapidly as possible. Over fifty orders and contracts are now in hand.

## CAPITAL £100,000 IN SHARES OF £1 EACH.

## ABRIDGED PROSPECTUS.

**PATENTS ACQUIRED.**—The Company has purchased the well-known COULTAUS' PATENTS, for the United Kingdom and France, together with the rights for the same invention in Austria, Belgium, Holland, Denmark, Norway, Sweden, Russia, Turkey, Italy, Spain, Portugal, Australia, India, and the Colonies (except Canada), with the right to acquire the valuable German Patents, and to develop and extend the already large sale of Sphincter Hose.

The new issue of £25,000 is made for the express purpose of enabling the Company to extend and further develop its business in England, the Continent, Colonies, and other countries covered by its Patents, and to increase the existing plant to meet the demand which has ensued.

**WHAT IS THE SPHINCTER GRIP ARMOURD HOSE?**—The Sphincter Grip Armourd process differs in many essential and important features from other processes of coiling or adapting steel wires into a spiral form, either as an armour strictly speaking, or for the purpose of a spring. Under it the wire is wound around the hose, with a perfect grip, without any tendency to expand and open backwards after it has been placed in its intended position. It has been found hitherto impossible to obtain this holding tendency without fastening and securing the wire at each end, whereas Hose may be armoured under these patents in any length and in any size, and can be cut anywhere without loosening or uncoiling, the Sphincter Grip of the wire being self-holding through its entire length.

The Company's Books contain many hundred current accounts with some of the leading Noblemen and Gentry, and most important Brewers, Distillers, Railway and Steamship, Mining and Gas, and Water Companies, Town Councils, and Municipal Corporations, Builders, Contractors, Mills, and Factories, &c. (List of users to complete Prospectus.)

The Company have established Agencies in various parts of the United Kingdom, and have orders in hand or executed for Australia, India, the Cape, South America, and the Continent.

**SOME ADVANTAGES OF THE SPHINCTER GRIP HOSE OVER OTHERS.**—It cannot kink. More Hose is destroyed by the sudden concussion through kinking when a full velocity of water is rushing through it than in actual Wear. "Kinking Destroys Hose." It will stand practically unlimited pressure. The armour is a perfect protection from abrasion. It is more flexible than other hoses. The flow of water is never obstructed or interrupted. Its advantages over other so-called armoured hose are that—There is no oil or other obnoxious preparation in the manufacture of the Hose; there is no inside spiral wire to diminish and resist the flow of water; it cannot collapse in ordinary use; the Sphincter Grip Armourd Hose can be cut anywhere without loosening or uncoiling, as it is self-holding throughout its entire length. The cost to the consumer of Sphincter Grip Hose is no greater than that of ordinary first-class hose, and for high pressures will actually be less, while its lasting qualities are many times greater. As a Steam Hose it supplies a long felt want, as it will stand practically unlimited pressure, and may be used with safety and impunity.

The Company will have the virtual monopoly of this branch of the trade; and as an illustration of the profit that may be reasonably anticipated, the well-known article of Garden Hose may be introduced, of which upwards of 5,000,000 feet are annually manufactured in the United Kingdom. The armoring of even a portion of this would be a considerable source of profit on the capital employed, while the hose for Railway, Mining, Manufacturing, and other purposes, of which a far larger quantity is sold, would yield a proportionate profit. In addition to this there will be the trade profits to be realised on the hose itself, and from other works which the Company have and will embody in their undertaking.

See Complete Prospectus for other Sources of Profit and particulars as to the general business and operations of the Company.

**COST OF PRODUCTION.**—The cost of armoring hose is small. The presence of the armour imparting enormous strength renders the hose practically indestructible, and allows the use of a lighter rubber and less material than would be required in an unarmoured hose answering a similar purpose; hence this Hose can be manufactured and put in the market at as cheap a rate as any other hose.

The price paid for the Armourd Hose Patents is £5000 in cash by instalments, and £15,000 in fully paid up shares. See note above.

The Company's present plan is now in full operation, and from the Hose business alone the Directors have every reason to expect that a dividend will be declared at the next ordinary General Meeting.

No promotion money has been or will be paid.

Trade and other contracts have been entered into, particulars of which can be had on application.

Prospectuses and Forms of Application for Shares may be obtained at the offices of the Company, of the Bankers, Brokers, and Solicitors, where the Memorandum and Articles of Association can be seen. Where no allotment is made the deposit will be returned in full, and where a less number of shares are allotted than applied for, the balance of the deposit will be applied towards the payment due on allotment.

LONDON, November, 1888.

## FORM OF APPLICATION FOR SHARES, AT PAR.

To be sent to the Secretary, Mr. F. MARTEN HALE, at the Offices of the Company, 63, Ford Street, London, E.C., who will procure and forward Bankers' receipt.

ENTITLED TO BE PAID UP IN FULL.

**THE EARLY HISTORY OF VINE  
CULTURE IN ENGLAND.**

THE exact period at which the Vine was first introduced into England is uncertain, but from a remark in the *Vita Agricola* of Tacitus (ch. xiv.), to the effect that our climate was not suited to it, it is evident that it had been tried, though without success, some time before the end of the first century A.D.

Notwithstanding this failure, however, it was again brought to England about the year 280 A.D., when it appears that a licence was granted by the Emperor Probus to the provincials of England to plant vineyards; and the Britons are expressly mentioned by Vopiscus among the natives who partook of it.\* The very early existence of the Grape Vine in England is also indicated by the name of Winnall, in Hampshire—a name which is derived from the Celtic "gwinllan," a vineyard. That the cultivation of the Vine was not afterwards abandoned is proved by a passage in Bede's *Ecclesiastical History*,† (eighth century), which refers to Vine-growing in England; and by the confirmation of a grant of a vineyard by King Edwith to Glastonbury Abbey in the tenth century.‡ It seems probable, however, that some of the vineyards planted here by the Romans were afterwards neglected during the anarchy and devastation which succeeded their immediate period, since "old Vines" are not infrequently mentioned as landmarks in Anglo-Saxon charters.§ These "old Vines" were probably "survivals" of the Roman vineyards. Vineyards are also mentioned in the Laws of Alfred,|| and are not unfrequently represented in Anglo-Saxon illuminations.

\* "Gallus omnibus, et Hispanis, ac Britannis hinc permisit ut vines haberent vinumque conferuunt." *Hist. Augustae Script.*, vi., ed. Cussab. fol. Paris, 1630, p. 240.  
† *Monumenta Hist. Britan.*, fol. 1848, p. 168. "Virens etiam in quibus locis germanis."

‡ W. de Gray Birch, *Cartularium Saxonum*, vol. iii., p. 89. This vineyard was situated at Pathenesbergh, in Mera, co. Somerset. It is also mentioned in *Domesday*, vol. i., f. 90 a, col. 1.

§ See Kemble, *Codex Diplomaticus*, vol. v., 1147, 1177, &c.  
|| *LL. Anglo-Sax.*, Wilk., p. 31; *LL. Aelf.*, 28.

nated manuscripts. Thus, for instance, there is a vignette in a celebrated illuminated calendar which represents a party of Anglo-Saxon gardeners pruning their Vines with large pruning knives, and planting them in order. This operation, the calendar informs us, took place in February. Another important fact which throws some light upon the early cultivation of the Vine in this country is, that the Anglo-Saxons called the tenth month of the year, not October, but "Wynmonth"—the month in which they crushed their Grapes and made their wine.

In the *Domesday Book* thirty-eight vineyards are mentioned. They were distributed over the counties of Berks, Essex, Hampshire, Hertford, Dorset, Middlesex, Norfolk, Suffolk, Wiltshire, and Kent. Some of these vineyards, the book tells us, were in existence in Edward the Confessor's time; others were but newly planted.\* Some, we are told, bore Grapes; others did not.† The largest vineyard mentioned in *Domesday* was that situated at Bithesham, in Berkshire.‡ It consisted of twelve arpends. Another, on the property of Alberio der Ver, at Belcamp, in Essex,§ consisted of eleven arpends, though we are told that only one bore. Another, which was situated at Rageneia, in the same county, consisted of six arpends, "yielding 20 modii or barrells of wine, if the season was favourable."||

At the time of the *Domesday Survey*, vineyards were situated in the heart of London. One in Holborne belonged to William the Conqueror's chamberlain, who paid "vj. yearly for the ground whereon his vineyard is situated." It has very generally been thought that at the time of the Norman Conquest only the larger monasteries possessed vineyards. This, however, is not the fact, for several entries in the *Domesday Book* undoubtedly show that several of the laity possessed them. The accounts of Ely Church inform us that Vines were largely grown, and wine manufactured, near Ely, at the time of the Norman Conquest.¶ In fact, the Isle of Ely was so famous for its Vines about this time, that the Normans called it "L'île de Vignes."

William, of Malmesbury (twelfth century), speaking of Gloucestershire, says:—"The country is planted thicker with vineyard than any other in England, more plentiful in crops, and more pleasant in flavour. For the vines do not offend the mouth with sharpness, since they do not yield to the French in sweetness."\*\* The same author also speaks of the vineyards at Ely. Another writer of the twelfth century, Henry of Huntingdon, also mentioned that Vines were grown, and that wine was made in England in his time, but he notes that vineyards were "rare."†† In the reigns of Rufus, Henry I., and Stephen, the ground now known as East Smithfield was occupied as a vineyard, and held by the con-

stables of the Tower.\* "This land originally belonged," says Stowe (*Survey*, ed. 1589, p. 46, 124), "to the Priory of the Holy Trinity within Aldgate, and they did not recover it till the second year of Stephen, when the same was adjudged and restored to the church."

We learn from the Saxon Chronicle † that in 1137 Martin, Abbot of Peterborough, planted an extensive vineyard within the walls of his own town. In the middle of the twelfth century among the appendages to Windsor Castle was a vineyard, and the pay of the vintager and the expenses of gathering the Grapes are among the regular annual charges relating to Windsor on its Pipe Rolls from the commencement of the series in 1155. Neckham, writing at the close of the twelfth century, devotes a whole chapter to the cultivation of the Vine. John de Garlande, writing a few years later, also mentions the Vine, and notes that it was cultivated in rows.‡ Somner tells us that in the year 1285 both the abbey and priory of, and many of the manors belonging to, Canterbury, were plentifully furnished with vineyards.§

From a manuscript in the British Museum we also learn that the monks of Spalding Priory planted a vineyard for their own use about the end of the thirteenth century.|| Among other expenses of Edward I. for 1272 occur the following:—"To Richard Wolward, keeper of the King's house at Westminster, one mark to repair the King's vineyard there." Another entry on the same roll, four years later, runs:—"Pay to R. W., keeper of their house at Westminster, one mark, there to dress our Vines as heretofore in the preceding years he hath been accustomed to do." In 1265 one Vine was bought for the King's garden at Woodstock. In 1294 a lock and key (price 4d.) was bought for the "vinary" at Hampstead,¶ and in 1296 there was a vineyard belonging to the Earl of Lincoln in Holborn, which, judging from the number of men employed in it, must have been a large one.\*\*

The Vine seems also to have been extensively cultivated at Ledbury, near Hereford, by the monks under Bishop Swinfield, and that wine was made there as late as 1289, is proved by the Bishop's household accounts. From these it appears that the vineyard yielded seven pipes (*dolia*) of white wine and nearly one of verjuice.††

At the commencement of the fourteenth century the Vine was to be found in almost every burgher's garden. In 1311 a certain Hugh de Stowe raised two bars under his Vines opposite his tenement in Chero. Lambert tells us that when Edward II. was at Bockinfield in 1316, Bishop Hanson sent thither "a present of his drinks withal, both wine and Grapes of his own growth in his vinery at Haling near Rochester."‡‡ It is just possible that this vineyard was still in existence and produced excellent Grapes at the commencement of the sixteenth century, for we find in October, 1502, the Dowager Queen, Elizabeth of York §§ receiving presents of Grapes from the Bishop of Rochester. Stowe mentions that in the times of Richard II., Vines were cultivated in great plenty in the Little Park of Windsor, and remarks that there was existing in his time an old manuscript roll in the Gatehouse

of Windsor Castle, "in which, among other things is to be seen the yearly account and charges of planting the Vines."\*\* Lamberde also says, that in the records "it moreover appeareth that the tythe hath been payed of wine pressed out of the Grapes that grew in the Little Park there, to the Abbot of Waltham, which was parson both of the Old and New Wyndour, and that accounts have been made of the charges of planting the Vines that grew in the said park, as also of making the vines, whereof some partes were spent in the household and some sold for the King's profit."† The Grape Vine was also largely cultivated about Cambridge in the fourteenth century, and several interesting items referring to the vineyard occur in the accounts of the various colleges. Willis, in his *Architectural History of Cambridge*, considers that the Vine was generally planted for the sake of the shade it afforded. That this was not always so, however, is proved by many entries on the accounts which refer to the vineyards. The accounts of the Guild of Corpus Christi in 1348 contain a charge for "splentes for the vineyard," and one of the pieces of ground composing the site of the Physic Hostel included a plot of Vines (parcella des Vynes) in 1369. In the early fifteenth century vineyards were attached to several of the colleges. At King's Hall in 1418-19 a charge occurs for pruning the vineyard, and a similar charge occurs in 1452. In this instance the Vines were attached to poles which rested on forked sticks, as shown by charges for "crutches" and "rails." ‡

The culture of the Vine was carried on by the laity with equal ardour at the commencement of the fifteenth century, for the poet Lydgate tells us that it was one of his chief amusements when a boy, besides stealing Apples in "other mannes orchards,"

"To plucke Grapes in other manne's Vines."

*Minor Poems*, p. 255.

In another poem the same poet tells us of the "Vinettes running in the casements," showing that Vines were then, as now, trained over the walls of the houses. After the middle of the fifteenth century, however, Vine culture was neglected, "partly by slothfulness, not liking anything long that is painful; partly by civil discord long continuing, it was left, and so with time lost, as appeareth by a number of places in this realm, that keeps still the name of vineyard; and upon many cliffs and hills are yet to be seen roots and old remains of Vines."§ It is probable, however, that many other causes, besides this of "not liking anything long that is painful," interfered with the culture of the Vine in the middle of the fifteenth and early years of the sixteenth century. A writer in the *Biographia Britannica*—a book which was published in the seventeenth century—affirms that "we have still upon record a treaty of peace between France and England, in which it is stipulated that we should root up our vineyards, and be their customers for all our wine."|| "If such extirpation of the English vineyards was 'not owing to this,'" says another writer, "it might be to the increased intercourse with the Continent and the falling of Gascony into the hands of the English, when wine was imported cheaper and better than we could make it." The suppression of the monasteries in England in the early part of the sixteenth century must also have contributed much towards the loss of our vineyards. In the seventeenth century several attempts to cultivate the Grape Vine on a large scale for making wine were made in England, but all these attempts failed. The cause of this failure was probably carelessness, for Master Barnaby Goodge, a celebrated gardener of the period, was of the opinion, or rather of "the per-

\* As at Westminster, "four arpenni of vineyard newly planted (vinea novella)," tome i., p. 175 b.; or as at Ware, "a vineyard very lately planted (vinea nuprime plantata)," tome i., p. 138 b.

† As at Depehene, in Essex, "two arpenni of vineyard which bear (vinea portantes); and two others, which do not bear (vinea in portantes)," tome i., p. 73 b.

‡ Tome i., p. 40 b. In *Domesday* the vineyards are generally measured by the "arpenni"; but in four instances (tome i., p. 69 b., 86 b., 212, ii., p. 71), they are measured by the acre. The arpent equalled about a furlong.

§ Tome ii., p. 77. "xj arpenni vineje j portat."

¶ Tome ii., p. 43 b. "vj arpenni vineje reddit xx modios vini si bene procedit." A modius was nearly 2 gallons English measure.

‡ This, and the succeeding statement, is quoted on the authority of Holinshed. see his *Chronicles* (ed. 1587), vol. i., p. 3: confer also Gale, *History of Ely*, vol. ii., ch. ii. An entry dated 1319, in the register in the archives of Ely church relates that "7 dolia musti" were made from the vineyards that year.

suation," that "if diligence and good husbandry had been used, we might have had a reasonable good wine growing in many places of this realm." *Percy Newberry.*

# CROCOSMA AUREA VAR. MACULATA, BAKER.

REFERENCE to our illustration of the typical plant at p. 304 will serve to mark the difference between it and its finer and handsomely coloured ally, which we here portray (fig. 80), and which is in every respect the finest form of the variable *Crococsmā aurea* that has yet appeared. A glance, too, at the illustration of a bed of it at p. 305 shows what a beautiful object it is under favourable situations.

## NEW OR NOTEWORTHY PLANTS.

### LÆLIA PERRINII (Lindl.) VAR. ALBA (O'Br.), supra, p. 446.

How joyful were our about *Lælia Perrinii* nivea, and how we delighted in *Lælia Perrinii* irrorata! This plant does not produce such an *embarras de richesses* of flowers as does *Lælia* anceps. And now Mr. R. H. Measures, of the Woodlands, Streatham, S.W., has most kindly sent two inflorescences, one two, one three-flowered. These flowers are snow-white without any purple or yellow marks, and they remain snow-white. From Mr. R. H. Measures I quote what follows:—

FIG. 80.—CROCOSMĀ AUREA VAR. MACULATA: FLOWERS ORANGE, WITH A PURPLISH-RED SPOT.

After a careful search amongst numerous specimens from all parts of South and East Africa, and finding nothing like it, Mr. J. G. Baker named and described the plant in the *Gardeners' Chronicle*, p. 407, from material supplied by its introducer, Mr. James O'Brien, of Harrow-on-the-Hill, who had previously received a First-class Certificate for it at the Royal Horticultural Society. Mr. O'Brien informs us that it was in bloom for over four months, and was still in good condition. In habit it seems to be stronger than the plain yellow *Crococsmā*, and grows to a height of 3–4 feet. Single stems cut with their graceful leaves and placed in water for indoor decoration open their buds for weeks in succession. The plant is perfectly hardy in sheltered situations, and is a fine subject for the cold frame, greenhouse, or conservatory. There is one peculiarity about *C. aurea* var. *maculata* which should be noted, viz., the stalked and incurved character of the perianth segments up to the blotches, as it seems to show that it might possibly be a wild hybrid.

"A plant was obtained by one of Mr. F. Sander's collectors, and said to be absolutely white, but neither Mr. Sander nor myself believed that. I have grown it now for two seasons, and it flowers from eight leading growths, forming a sight worth taking a long journey to enjoy. The bulbs in shape are identical with those of *Lælia Perrinii*, but are pale green in colour. The leaf is much broader and larger than in *Lælia Perrinii*. It is, in fact, identical with a well grown robust leaf of *Lælia purpurata*."

To this I may add, that the lip is distinct from that shown in any sketch or portrait from any of wild-grown or garden specimens I have heard of in the genus *Lælia* Perrinii. Those altogether show remarkably well distinct side laciniae—Mr. R. H. Measures' plant, on the contrary, has a three-lobed lip, or even one which is rather confluent, hence nearly rhombic. I have also the impression that

the goitrous swellings of the ovaries are unusually prominent. *H. G. Rehb. f.*

### DECASCHISTIA FICIFOLIA, Mast., sp. nov.\*

This handsome Hibiscus-like shrub was discovered in Burmah by Mr. J. Bonham Carter. Seeds were brought home by that gentleman, and the plant has recently flowered in his garden. A flower was obligingly forwarded to us for determination, with a reference to our monograph of Indian Malvaceæ, published in Sir Joseph Hooker's *Flora of British India*, and to the Herbarium at Kew, showed that we had to do with a hitherto undescribed species. It is well adapted for stove culture, being handsome alike in foliage and in flower. The shrub is more or less hoary, the leaves are light green above, hoary beneath, wedge-shaped at the base, and dividing above the middle into three oblong remotely toothed lobes. The flower is nearly 4 inches across, and probably will become larger under cultivation. In colour it is coppery-red merging into yellow, and with a rosy spot at the base. The floral characters are those of *Decaschistia*, a genus which differs from *Hibiscus* mainly in having ten styles and a ten-celled ovary, with one ovule in each cell. Most probably an imperfect specimen collected at Rangoon by the late Dr. Maingay, and preserved in the Kew Herbarium, belongs to the same species, but this cannot at present be asserted with certainty. *M. T. M.*

The seeds of the plant in question were gathered on August 6, 1887, on a plateau composed of a red clayey soil, about 350 feet above the Irrawaddy, and about 8 miles from Thabaitkine, on the road from that place to the Ruby Mines. The plateau was sparsely timbered with poor Teak trees, and the scarcity of undergrowth was very suggestive of great poverty or very small depth of soil; indeed, besides the plant under discussion, there seemed scarcely a dozen other kinds, scattered at wide intervals, and with not even grass or weeds between them. The bushes from which I gathered the seeds were from 2–4 feet high, and seemed to have nearly done flowering, as I saw only very few blossoms; these, however, were much larger and much brighter in colour (though I should say much the same among themselves) than the flower I sent you. *J. Bonham Carter.*

### VRIESEA WITTMACKIANA, n. hyb. (= V. BARILLETHI × MORRENIANA).

This nice new *Vriesea* is a fine and interesting acquisition. It was raised by Mr. Kittel, Curator of the gardens of the Count Magnis, at Eckersdorf, near Glatz, Silesia. The *Gartenflora* gives a coloured plate (1283) of the new hybrid, as well as of the parents. An idea of the plant may be obtained if the inflorescence of *Vriesea Barilletii* be taken, giving to it the colour of *V. Morreniana* ×. Mr. Kittel raised two forms, which differ more or less in the close arrangement of the flowers. This plant is the more interesting, as *V. Morreniana* is itself a hybrid, viz., *V. psittacina* × *carinata*. *V. Morreniana* × has the delightfully bright colour of the bracts, and so has *V. Wittmackiana* ×. The latter hybrid has also on the upper half of the bracts the numerous red spots of the female parent. *Dr. Dammer.*

**LEEDS HORTICULTURAL SOCIETY.**—The Chrysanthemum show of this Society, to be held on November 21 and 22, in the Town Hall, Leeds, will, it is said, be worthy of the district, judging by the hearty support it has met with from exhibitors.

\* *Decaschistia ficifolia*, Mast., sp. nov.—Fruticosa, canomentosa; petiolis ½ poll. long.; stipulis æquilongis linearibus subulatis stellato-pilosis deciduis; foliis 5 × 4 poll. late ovatis basi cuneatis 3-nerviis (nerviis parum divergentibus), antice fere ad medium 3-lobis, lobis subæqualibus subparallelis oblongis obtusis obscure dentatis basin versus angustatis, a sece sinuatis ellipticis separatis; bracteis 10 linearibus-subulatis, sepalis dimidio brevioribus; calyce campanulato ½ poll. long.; sepalis deltatoideis-lanceolatis prominenter 3-nerviis; corolla diam. 4 poll. basi breviter tubulata superne pænit; petalis imbricatis oblongis rubro-flavidis basi purpureis. Cæct. ut in congeneribus. In Burmah detecta dom. J. Bonham Carter, inde semina reportavit plantamque nunc primo florentem horto suo coluit. *M. T. M.*

## NURSERY NOTES.

### THE FRUIT NURSERIES OF MESSRS. J. VEITCH AND SONS.

LANGLEY, SLOUGH.—Here in a position peculiarly favourable for successful fruit-tree cultivation the Chelsea firm have a nursery that is well worthy of a visit from those who have an interest in pomology. The soil is loamy, similar to that which is used for brick-making; it lies over gravel, and it is evident that the trees find in it the constituents of vigorous growth. Large quantities of fruit trees are grown, very noticeable being the quarters devoted to horizontal and fan-trained Pears, comprising all the best varieties both on Pear and Quince stocks.

In a season such as the present when, speaking generally, Apples and Pears are somewhat scarce, and not of the best quality, we have thought it well (as it may prove instructive) to give lists of those which grow and also fruit so well here, pointing out by so doing such varieties as seem best adapted for general cultivation. It may be mentioned that all the fruit has been grown without any special care or attention.

*Pears*.—These were noted in all sizes from trees having two to five and seven tiers of branches, amongst which the following varieties were noteworthy by reason of the crops of fine fruit they were carrying, viz.:—*Summer Beurré d'Arenburg*, *Winter Nelis*, one of the best late Pears, *Passe Colmar*, *Olivier de Serres*, *Jargonelle*, *Glou morçeau*, *Duchesse d'Angoulême*, *General Tottleben*, *Souvenir du Congrès*, *Beurré Giffard*, *Beurré de Jonghe*, &c. Large quarters are devoted to pyramids in all sizes, and in excellent condition, both on Quince and Pear, many being good crops of fruit, the list including the names of our best Pears, and some others which, if amateur growers would exercise a wiser discretion, would very soon be consigned to the rubbish-heap.

*Apples*.—In this section are to be seen fine quarters of horizontal-trained trees on both Crab and Paradise stocks, many bearing, for such small trees, enormous crops. The varieties most notable in the collection were those which have repeatedly been brought under notice in the accounts of the late Conference at Chiswick, and which were to be found in certain numbers in almost every collection of moderate size. We noted several large quarters of pyramid Apples on Paradise and on Crab stocks—good, stout, well-shaped trees, and in many cases heavily cropped with fine fruit. Amongst others, specially noticeable may be mentioned the following sorts: (trees only three years old were carrying good crops):—*Domino*, a good early Apple, considered to be an improvement on *Keswick Codlin*; *Baumann's Red Reinette*, very large and highly coloured, a good keeper; *Cox's Pomona*, *Niton House*, larger than the famous *Stirling Castle*, and keeping good till March, therefore valuable; *Prince Albert*, very prolific; *Warner's King*, indeed a grand Apple; *Stone's* or *Loddington Seedling*, very fine; *Ringer*, large and fragrant; *Pott's Seedling*, excellent, the coming Apple; *Frogmore Prolific*, very fine; *The Queen*, large and handsome; and *Schoolmaster*, &c.

Several quarters of Apples on Crab are being grown as standards—each quarter holding about 6000 trees—amongst others, the *Sandringham* (introduced by the firm) is very conspicuous from its clear, straight, clean stem, and compact habit. It is considered here to be one of the coming Apples for orchard planting—the fruit, too, being of good size and quality; it is of handsome appearance, is a good keeper, and may, therefore, fairly lay claim to being a valuable Apple. *Tyler's Kernel*, *Mrs. Barron*, *Barnack Beauty*, *King Harry*, *Gascogne's Seedling*, and *September Beauty*, are varieties of recent introduction which promise to be of great value to growers for market as well as private gardeners. *King of Tompkins' County* is likely to be very valuable, especially in warm districts, being large and handsome, and late in the season, and of fair quality as a

dessert Apple. *Bismarck* (another introduction of the firm) is an extraordinary bearer, last year's maidens being in many cases loaded with fine fruit. *Washington* is a very beautiful American Apple, but wants apparently a warmer climate.

A great feature at Langley is the trial border, which runs the whole length of the portion devoted to fruit trees, in which are planted, with the view of testing, the best old as well as new, about 350 varieties of Apples. Similar borders are planted with Plums (containing all the best sorts), the crops of which have been very large this season, as visitors to the Royal Horticultural Society's meetings have witnessed. *Archduke* promises to be an acquisition, fruiting freely on either standards, pyramids, or cordons, and hanging very late. Pears are being tested in the same way, also Cherries; the whole length of borders thus planted is upwards of 1000 yards.

Regarding stocks for Apple trees in use here, it may prove of interest to note that the English Paradise is that principally used. The French Paradise forms very prolific little trees, but they are subject to canker, and in dry hot seasons the fruit is apt to be covered with spots which penetrate to the centre, rendering the fruit quite useless.

Amongst miscellaneous fruits all the best Gooseberries and Currants are grown. Of Raspberries there is a good collection, including the fine new variety named *Superlative*; this is very distinct in its strong robust growth.

### THE FULHAM NURSERIES.

Pears are here found in large quantities, fan and horizontal trained, both on Pear and Quince stocks. Apples are here also grown in quantity, very noticeable being the standard trees of extra size for orchard planting, pyramids on Crab stocks, and a fine piece of young pyramids on the Paradise of the leading varieties; dessert and Morello Cherries in large fruiting trees, standard and dwarf-trained. Referring to the trained Cherries here, it is computed that if they were walled they would cover a line of wall extending from Fulham to Chiswick. Standard and half-standard maiden and one-year trained Peaches are here in large numbers; while round the walls, fences, and borders are fine fruiting trees of the latter in considerable numbers; varying from 1½ to 5½ feet stems, with heads from 5 to 10 feet wide and 4 to 6 feet in height of stem; and the trained Peaches and Nectarines are exceedingly fine healthy stock. Mulberries, standard and trained for walls, were likewise noticed.

The larger nursery at Fulham—for there are two—is called *Southfields*, to distinguish it from the one above noticed, which once formed part of the land in occupation of the late firm of Messrs. Osborn & Sons. Here, in the presence of gas and other factories, and lying in the Thames Valley close to the manufacturing districts of Wandsworth and Battersea, it would be thought that the surroundings are not such as are suitable for successful fruit culture, and yet the stock is in a wonderfully thriving condition. The greater portion of the soil is sand and humus, the remainder loam over gravel.

Horizontal trained Apples both on Crab and Paradise have borne large fruit. Trees on latter stock are very suitable for small gardens, and for soils where trees on Crab grow too vigorously, and where large and highly coloured varieties are selected such trees are very ornamental. Pyramid Apples, principally on Paradise, are here in quantity, most of which have borne well. Pears trained on Quince (quite young trees) have borne well. Pyramids on both stocks are here in quantity in all sizes. About 4 acres are used for the cultivation of Peaches and Nectarines, the soil being favourable for the production of bearing wood and fibrous roots. Large numbers of extra sized trees with fifty and in one piece up to a hundred shoots on each tree, some of which are 12 and 13 feet across, were remarked. Standard trained Peaches and Nectarines are also a grand stock from one-year trained to trees that will carry next season good crops, many of the trees

being 6 feet and 8 feet across. Plums, dwarf trained in all sizes, from young trees with nine shoots to trees 7 feet and 8 feet across, the larger being transplanted, are literally bristling with flower-buds, and many of the trees have borne finely this season. Pyramid Plums are also here in quantity—large trees and standards of fruiting sizes. Cherries on the Mahaleb stock succeeded remarkably well in the light soil here, the Morellos and a good collection of Dukes being grown on it as cordons, pyramids, and trained trees. Many of the latter are extra sized, being from 8 to 10 feet across, and have borne well in open quarters. Apricots, standard and dwarf trained, are grown in quantity, and include some large trees. Amongst cordons, Apples, Pears, Plums, and Cherries have borne well, even trees transplanted this spring bearing good fruit. The candelabra or palmette form of trained Pears and Plums is very ornamental—there are many in this nursery. Gooseberries and Currants grown as cordons have been wonderfully prolific. Pyramid Gooseberries of some sorts were very fine. A house of Peach trees in pots struck us as very remarkable from their healthy appearance and vigorous growth. Figs in pots form an especial feature, four houses being devoted to their culture. *Violette Sepor*, a new variety introduced by the firm, is a kind which by reason of its many good qualities will undoubtedly make way when more widely known.

It now only remains to be stated that the nurseries which we have of necessity so very hastily and imperfectly described are under the supervision of Mr. Morle—Messrs. Veitch's fruit foreman.

### THE AIGBURTH NURSERIES OF MESSRS. R. P. KER & SON, OF LIVERPOOL.

These enjoy a high reputation locally and generally. Starting from Basnett Street, in which the office and seed-houses are situated, a pleasant drive by Sefton Park, and along a shady road towards West Derby, brings the visitor to Aigburth, where the nursery grounds, comprising an extent of 14 acres, are situated. They are compact, convenient, and well kept. The visitor sees there the best things intelligently cultivated by the manager, Mr. Ranger and presented to view in the best condition.

On entering from the West Derby Road, the visitor sees the office on the right, and on the left a pleasant piece of flower-garden; and then, following a path lined on either side with choice evergreen and deciduous shrubs, the houses are reached, of which there are several. The contents show that a general stock of stove and greenhouse plants is maintained, including many flowering subjects suitable for cutting from. *Clethra arborea* is largely grown; it is starved in small pots, and then flowers abundantly. *Dracæna canneffolia* is noticeable; it is a good hardy type of the *D. rubra* section, and stands well; and of *D. lineata* there are some very fine specimens. There are hundreds of small decorative plants and Ferns, and *Adiantum cuneatum* is largely grown. Palms are much grown, and plants of all sizes, from exhibition specimens down to those representing model table plants, were found. *Kentia* is the species mainly grown, these plants being in so much request for decorative purpose.

From the Palm-house radiate eight or nine others, forming a kind of glazed star if looked at from above. Here are two houses of *Cyclamen persicum*, which are as fine as any found in the neighbourhood of London. Messrs. Ker & Sons have been selecting for years, their aim being to get the large flowers of the gigantum type associated with the dwarf compact habit of the *C. persicum* type. One could but look with amazement on plants of such size, and so finely developed, by the first week in August. The plants were in 6-inch, 8-inch, and 7-inch pots, and it was said the flowers are of the highest quality—equal, at least, to anything grown in the neighbourhood of London.

Greenhouse *Rhododendrons* form another leading feature, and are much in demand. For decorative purposes the best are *Duchess of Connaught*, *Duchess of Teck* (which has pale buff flowers), and *Duchess*

Royal, of a charming shade of pink. It may be said of some of them that they are almost perpetual flowerers. Next came a large batch of winter-flowering Begonias, the best being M. Lemoine's new varieties of the semperflorens section, such as *elegans*, *gigantea*, *carminea*, and *rosa*, which are the very best for winter work. Double and single varieties are also grown, and they increase in popularity year after year. *Cyperus distans* is noticeable as a fine decorative subject; it is of dense growth, and valuable for furnishing. *Pouretia* (*Puya*) *mexicana* is valuable as a house plant; it is of slow growth, and stands well. Here is the best form of *Ficus elastica* albo-variegata I have yet seen, each leaf having a distinct well-defined bordering of white on either side, young and old plants alike being well marked. It is in great demand.

In the *Lapageria* house is growing one of the original plants sent out by Messrs. Veitch & Sons to compete for the Davis Medal, and it is a very fine variety. It occupies the middle of the house, at each end being a strong plant of *L. rosea* superba. A large number of layers of the white variety had been laid down.

In the stove-houses could be seen *Eucharis candida* in flower, a quantity of *Cocos Weddelliana*, and other choice Palms requiring heat. *Coccoloba pubescens* is noticeable as a large-leaved stove-plant with bold foliage—an old West Indian plant not often met with. *Dracenas lineata* and *Drousetii* are worthy of mention as very elegant forms among the collection grown here; *Selaginella Emiliiana* is a remarkably pretty form; and *Adiantum cuneatum fragrantissimum*, a desirable scented form. *Amaryllis* of the best pedigree are a good feature also; there is a numerous collection, and among them very fine seedlings of Messrs. Ker's own raising. *Bouvardias* are also largely grown, and especially for cutting from. President Garfield and Alfred Neuner are the best doubles, and among the single varieties a recent introduction, President Cleveland, is noticeable for its fine colour and excellent habit of growth. It is only possible in a brief sketch to dwell upon the leading features in such a comprehensive collection of stove and greenhouse plants as is found in this nursery.

The most remarkable plants are the Crotons. They are growing in a span-roofed house 12 feet in width, which is glazed with 20-inch panes of glass, the bars being stronger than is usual to bear the weight, and the glass goes down to the side stages. Light is therefore admitted on all sides as well as above, and there is no stinting of it. Every species and variety appears to grow freely and colour beautifully. Thorough cleanliness appears to be a leading condition to excellence. The principle worked upon is that prevention is better than cure, and no plant is allowed to go into the house without subjecting it to a close inspection; all new varieties brought in are placed in quarantine before being allowed to join the others. Shade is given on the sunny side by means of a blind through June, July, and August, and in bright weather they are syringed about once a day.

The collection comprises over fifty sorts. Two new varieties were particularly noticeable: one is Aigburth Gem, a most elegant narrow-leaved variety; the old leaves dark crimson and Aloe-green, the younger ones green and fiery gold—a charming table plant; the other Aigburthensis, like the preceding, a free growing branching variety, with an abundance of elegant narrow leaves of a bright primrose-yellow, narrowly margined with green: an exquisite table plant. It is impossible to do justice to this department of the nursery in a sketch of this character; but out of the collection the following can be selected as fine exhibition varieties, displaying great diversity of character:—Aigburthensis, Neumanii, Queen Victoria, a grand show Croton; Hawkeri, Bergmannii, Varrent, inter-raptus aureus, Ruberrimus, Mortefontaineensis, Baron Frederic de Sellière, Baroness Rothschild, and Evansianus. I hope to refer to this collection

of Crotons again, dealing with some particulars of an interesting character.

Vines in pots are extensively cultivated, and occupy a large specimen house with hotwater-pipes underneath the stages: the main body from eyes, and a very fine lot of plants indeed. There may be differences of opinion as to which are best for planting and forcing, cut-backs, or young plants from eyes; judging from the appearance of the canes the latter appear the most promising. The Vines are not put outside, but finished off in heat. The canes are carried upright into the roof of the house, fastened to wires running the length of it. How such fine plants were developed from eyes in so short a time seems marvellous; and they certainly display high cultivation. All the leading varieties are grown.

*Outdoors Department.*—In the open nursery there is a large collection of trees and shrubs. Some very fine bushes of *Olearia Hastii* in full bloom were especially noticeable. It is a good sea-side plant, perfectly hardy, and flowering freely; quite tiny plants in cutting beds were seen in bloom. *Cornus mas variegata* stands better at Aigburth than does *Acer Negundo variegata*, and is being much used in its place in the Liverpool district for dwarf effects. *Veronica Traversi* was blooming freely, and is found to do well under the shade of trees—a fact worthy of being noted. A large specimen of *Genista atro-virens*, quite a standard tree, with the remains of its summer service of golden flowers, is worthy of mention for its summer floral service. The white-flowered *Rhododendron blandum* is largely grown because so useful in many ways, and especially as a forcer. Such varieties of *Rhododendrons* as do not readily unite with the stock when grafted are raised from layers. *Rhododendron Cynthia*, an excellent doer, bearing large trusses of crimson flowers, and having a capital habit of growth, should be noted as a plant well adapted to Lancashire. Some sorts do not set their buds well so far north. *Brayanum* and *Madame Wagner* represent varieties that always set well for bloom. *R. caucasicum* and *Cunningham's* white, though frequently confounded, are distinct. A very fine and useful variety for the district is *The Queen*. *Helen Waterer* is remarkable for its noble foliage. *R. caucasicum pictum* and *compactum* are perfectly hardy, and stand well. In selecting their collection of hardy *Rhododendrons* the Messrs. Ker have paid strict attention to sorts suitable for the county. *Skimmia oblata* makes a capital town plant for Liverpool. It is perfectly hardy, and is not affected by dust and smoke.

Of forest trees there is a large and varied collection: in a group of standard Lilacs and of herbaceous plants there is a numerous selection also. Fruit trees are to be found here also, and of Apples and Pears such varieties as are suited to the locality.

In walking round the nursery, the visitor cannot fail to notice in the shrubbery borders not a few novelties, as constant additions of new subjects are made. *Crataegus Lelandi* is noticeable as a great acquisition, as it bears clusters of rich Orange berries even on young plants. Here is *Prunus Pissardi*, its claret-purple foliage gleaming amidst green surroundings at all points. *Hodgens' Holly* is largely grown; it is a very fine plant for Lancashire—this and the Old Silver are the best for the district: the Golden and Silver Queens are found too tender. *Cytisus Alkekengi* gives racemes of yellow flowers very early in the year. *Fraxinus lentiscifolia pendula* has very elegant foliage, and makes a capital weeping tree. *Rhamnus alaternus decorus* makes a good town shrub—it is Bay-leaved, and they are of a thick leathery substance. *Genista precox* makes an excellent standard worked on the common *Laburnum*, and is a charming spring-blooming plant. *Ligustrum sinense*, *L. glabrum*, and *L. latifolium novum* are all good free-blooming Privets; *L. ovalifolium* stands best. Some make a late growth, and do not mature their foliage, and the frost cuts it back.

Standard and pyramidal Bays in tubs are a fine feature; they are numerous, and well cultivated. The Willow-leaved pendulous Pear, with its silvery

foliage, is a very attractive tree. *Limonia trifoliata*, with its long spines—and, indeed, a pretty representative of the Orange family—is found to be hardy in this locality. What a charming tree the Fern-leaved *Crataegus oxyacantha* makes! So does the transparent Crab when fruiting.

At Basnett Street, Liverpool, are the spacious shop and offices of the firm. A large seed business is done, and a considerable bulb trade; and that in agricultural seeds is rapidly increasing. *Visitor*.

## ORCHID NOTES AND GLEANINGS.

### PHALANOPSIS ANTENNIFERA, Rehb. f.

WHEN I gave my enumeration of species of *Phalanopsis* in the *Gardeners' Chronicle* (n. s., vol. xxvi., pp. 168, 212, and 276), I had not seen this decidedly pretty species; but at the present time I am more fortunate, as a good plant is now flowering in the Kew collection, and side by side with it is a plant of *P. Esmeralda*, also in flower (so that species has not been lost to cultivation, as suggested in these columns some time ago, though I cannot lay my hands on the reference at the present moment). Consequently I have been able to compare the two together, first satisfying myself that they are correctly named, by comparing them with the original original descriptions of the species. The result is that I believe *P. antennifera* is only a colour variety of the earlier described *P. Esmeralda*. The only difference in shape I am able to detect is, that in the former the stigma is a little broader than in the last-named species, and this is probably only such a minute difference as would be detected in different individuals of the same species. As to colour the two present the following differences:—*P. antennifera* has the sepals and petals light rosy-purple, the front lobe of the lip and the column deep amethyst-purple, while the side lobes of the lip are sepia-brown, inclining a little towards orange. *P. Esmeralda* can best be described by saying that every part is several shades lighter, a little inclining towards yellowish or whitish in places. The remarkable linear appendages on the stalk of the lip are precisely alike in both, while at the base, the club-shaped apex being of a deep orange. Our stock of knowledge as to the variability of many Orchids is gradually increasing, and I suspect that many variations of *P. Esmeralda* would be found in a large series of specimens. *R. A. R.*

### ARACHNANTHE CLARKEI.

A good plant of this handsome species is now flowering in the Kew collection. It was described in these columns in 1886 (n. s., vol. xxvi., p. 552) as *Esmeralda Clarkei*, *Rehb. f.* It is so closely allied to *Arachnanthe Cathartii*, that the two species must be placed together, and as *Esmeralda* is referred to *Arachnanthe* in the *Genera Plantarum*, it is clear that this species must also be placed there by those who adopt this system. Its habit very closely resembles that of the species just named, while the peduncle bears two or three very handsome flowers of over 3 inches in diameter. The sepals are linear-oblong, cuneate at the base, the lateral ones being somewhat curved in a falcate manner. The petals are a little broader, and likewise somewhat curved. In colour both these sets of organs are of a bright and warm sepia-brown, with transverse bars of light yellow, giving them a brilliant effect. The pendulous lip is articulated to the foot of the column in a very delicate manner, and a slight touch or breath of wind sets it oscillating backwards and forwards, though it moves in a small part of a circle unless violently shaken. The effect of this is very curious, and obviously has some connection with the fertilisation of the flower. The front lobe of the lip is large, broadly roundish, with a small lobule at its apex, the colour warm sepia-brown, with seven to nine radiating white raised keels, while the side-lobes are much smaller, roundish, and white with radiating broad lines. The

gland is highly curious, being exactly hippocrepiform in shape, in which respect it differs somewhat from the other species of the genus. It is a Himalayan plant, and for its discovery we are indebted to Mr. C. B. Clarke, F.R.S., the well-known Indian botanist. *R. A. Rolfe.*

#### ORCHIDS AT THE FIRS, SYDENHAM.

The collection of C. Dorman, Esq., is a very select one, and contains a number of very scarce species, but the middle of October is not the time to see a great number in flower. Of *Cattleyas* in flower I observed *Bowringiana*. The past season has seen large importations of this plant, and it may be obtained at a cheap rate. It is near to, and requires the same treatment as, *C. Skinneri*, but its growth is rather more vigorous. At the base of the stems there is a peculiar swelling, from which a number of roots proceed.

*Cattleya luteola* was in flower; it is a distinct species, and is one of the smallest growing of *Cattleyas*, grown under the name of *C. Holfordii*. It was in flower about the middle of August, and still in good condition when I saw it. Good forms of *Lælia elegans* and *L. Perralii* were in flower. The latter species requires a warm *Cattleya*-house temperature, and when well grown is a handsome plant; and always flowers in the autumn months. The handsome *Compæretia macropleuron* was in flower in the *Cattleya*-house, and is also a species that may be depended upon to flower in October; it should be grown in a basket rather than on a block, the pendulous spikes of bright rose-tinted flowers making a pleasing feature. In another house *Lælia pumila* var. *præstans* was in flower, and also *Cattleya eldorado splendens*, a handsome form of the species with rose-pink sepals and petals, and a handsome orange blotch on the lip.

In the warmest house some handsome *Cypripediums* were noteworthy; *C. Sanderianum* is quite a wonderful plant, and even more quaint in appearance than *C. caudatum*; the yellow dorsal sepal is marked with distinct purplish-brown lines; the lateral sepals have tail-like appendages, 26 inches in length; they are richly marked at the top, and when the sun shines on the flower the effect is very beautiful. *C. Warneri* was very pretty; it is a neat growing and very distinct form of *barbatum*; the dorsal sepal is rosy-purple at the base, the top part is white, lightly striped rosy. *C. purpuratum* is very pretty, and much like *C. barbatum*; it also blooms in November. There is a handsome specimen of *C. leucorrhodum* showing flower—still a rare plant, and one of the most beautiful of hybrid forms. *Vanda Sanderiana* had six handsome blooms on one spike, and there was also in this house a nice healthy lot of *Anæctochili*. There were not many species—in fact, a good collection of these beautiful foliaged plants is not now to be seen anywhere. *A. Lowii*, now classed under *Dossinia*, and grown as *D. marmorata*, had large, healthy well-marked foliage. There were two varieties of it. *A. petola*, a pretty little plant, is now *Macodes petola*; *A. Dawsonianus* also classed with *Goodyera*—this species is very free in growth. They all succeed well as grown here in a glass frame where they are by themselves, and if the leaves are kept free from insect pests, and the plants are potted on as they require it, the leaves speedily increase in numbers.

The cool-house contained a nice lot of flowering plants for this season of the year, amongst them the pretty little *Oncidium Phalaenopsis*; it has white flowers prettily spotted reddish-violet. *Odontoglossum* *Christidi majus* is a very small growing plant flowering freely, the pure white flowers, with yellow blotch on the lip, are sweetly scented and freely produced. *O. Dormanianum*, whitish and densely spotted brown; is very distinct and pretty. There was also in flower a pure white form of *O. crispum*, flowers of good form and exquisite purity. *Masdevallia Rœzlii* had not yet passed out of bloom but was producing a few of its quaint blossoms. *Lælia autumnalis* was nicely in flower, beautiful to look at but offensive to smell. *J. Douglas.*

#### ORCHIDS AT WOOLTON WOOD, LIVERPOOL.

The fact that the collection belonging to Holbrook Gaskell, Esq., is rapidly progressing into something like its former excellence, and that under the undoubted skill of Mr. Todd, who is not only a clever Orchid grower but equally good at any other branch of gardening, is likely to become better than even in its palmiest days, cannot fail to interest all concerned in Orchid growing. Generally speaking Orchids need not decline under cultivation, although unfortunately they are often allowed to do so, but that they are amenable to good culture even when in poor condition has been proven by Mr. Todd on many a valuable specimen. The Woolton Wood collection contains many rare species and varieties, and more especially among the showier genera; the houses are well adapted for Orchid culture, and under proper management they should be bright with flowers more or less all the year round. At present the plants are quite fulfilling their duties, and some noble examples are in bloom. In the centre of a group in one of the large span-houses a splendid example of our old friend, *Cattleya Loddigesi* has two dozen of fine flowers open; with it are some good masses of *Lælia Perralii*, a number of the best varieties of *Cypripedium insigne* and *C. Sedeni*, a large plant of *C. vexillarium*, *C. javanicum*, richly flowered pans of *Pleione*, *Cattleya aurea*, *Miltouia candida grandiflora*, *Oncidium pretextum*, some *Ionopsis*, *Cirrhopetalum ornatum*, with other pretty things in flower, and the handsome *Lælia superbiens* *Quelsneriana* in spike.

Passing to the next range we find in flower a splendid form of the rare *Dendrobium Phalaenopsis*, *Cypripedium Dayanum*, *C. Dominianum*, *C. ænanthum superbum*, *C. caudatum*, which bore flowers with petals 30 inches long; and the charming *Odontoglossum Londesboroughianum*, with its golden flowers, which many fail to get it to produce, but which Mr. Todd succeeds with by keeping the plants dry after maturing the growth.

In the next division *Cypripedium Spicerianum* was fine, a good batch of *Odontoglossum Rœzlii* thriving, and some interesting *Anæctochili*, *Bertolonias*, *Sonerilas*, &c., appeared.

An unshaded span-house has been used all summer for the varieties of *Lælia anceps* and other Mexican *Lælias*, which are now sending up a large quantity of flower-spikes, and with them have been kept some large specimens of *Oclogyne cristata*, which are very healthy and vigorous, notwithstanding the fact that they are supposed not to like sunlight. In the same house is a *Lælia albidia* with over fifty spikes, and some rare white *L. anceps*. *Sarracénias* occupy part of another division with good specimens in flower of *Oncidium tigrinum* and *O. unguiculatum*, and a robust lot of the fine white *Dendrobium Jamesianum*.

In another house among a profusion of healthy specimens in flower are some *Masdevallia chimera* and *M. bella*; the snow-white and fragrant *Maxillaria venusta* in large specimens; *Mesopidinium vulcanicum*, the pretty pink *Odontoglossum Cervantesi morada*, and some showy *O. grande*. The cool houses never looked better than they do now, the *Odontoglossums* are very vigorous and sound, not many of the white species are open; but of *O. crispum*, *O. Andersonianum*, &c., many are in bud; the same applies to the well grown *Masdevallias* in their house, only a stray bloom or two appearing on the bright coloured species, while that charming and rare species, *M. Gaskelliana*, which is almost perpetual flowering, bears but one. In shape it is something like *M. nycteria*, but of a cream colour prettily mottled with rosy-red, the long tails being red. It is a distinct and very pretty species, its flowers appearing all the more attractive by contrast with its narrow bright green leaves. For the rest of the garden under glass it may be said that the *Calanthes* are grown to perfection, so also the large and grandly flowered lot of *Eucharis amazonica* in the stores. The *Phalaenopsis* are improving but are still a "far cry" off their glorious condition of a few years ago before their house was altered for improvement. *Vanda Sanderiana*, too, is in bloom.

The rockery-house, as re-arranged, is one of the greatest successes which this garden has achieved. The rockery, built under Mr. Gaskell's own supervision, was always a fine one, but it was spoilt by planting miscellaneous plants. All this has been done away with, the rockery rearranged, and, with the exception of a few grand Tree Ferns, planted as a cool filmy-fernery, some grand *Todeas*, rare *Hymenophyllums*, *Trichomanes*, and such things, giving the house a most beautiful appearance, and returning a good reward for the trouble and expense of the work of renovation. Woolton Wood is a fine garden, and its owner is as great an enthusiast as ever. *J. O.B.*

#### RODRIGUEZIA SECONDA.

We find this plant to thrive best in the *Cattleya*-house in a small hanging basket, or suspended on a block of wood; but in whatever way it may be grown it should have very little soil about its roots. The drainage must be maintained in thoroughly efficient order, for although an atmosphere well charged with moisture is very conducive to its well-being, the roots prefer absorption from the air to having a quantity of wet sour material constantly about them. It requires a considerable amount of moisture during the growing season, and at no time in the year should it suffer from drought, as its diminutive bulbs cannot support it in health for any length of time without water; inattention to these small matters often causes the cultivator much loss or disappointment. This species does not like to be disturbed, so that if the plant is thriving in any particular position, allow it to remain, for frequently it is found that one part of the house is more suitable than another for different plants. It will not require re-basking often, but when this is necessary the new material should be placed about it just after new growths appear. *The Orchid Album, October.*

#### THE DOUGLAS FIR IN SCOTLAND.

(Continued from page 532.)

ALTHOUGH the Taymount plantation gives some valuable information respecting the early development of Douglas Fir compared with that of Scotch Pine, it leaves us as yet completely in the dark as to the further progress of production with advancing age. We have detailed and accurate information of the rate of increment of various European Conifers, such as Scotch Pine, Spruce and Silver Fir, but our oldest pure plantation of Douglas Fir consists of trees now only thirty-two years old. As regards the production per acre in its native home nothing reliable is available.

Hough, in his *Elements of Forestry*, (1882), tells us that the Douglas Fir reaches in Oregon to the enormous size of 200–300 feet in height, and from 15–20 feet in diameter; he adds, however, that the tree is more commonly about 150 feet high and from 4–8 feet in diameter. In America the trees are said to stand near each other, but this they certainly do not in the Scotch plantations; on the contrary, here an acre can, owing to the spreading nature of the branches, accommodate only a small number of trees compared with other species. On the whole, the matter requires considerable further investigation. This could best be done by a competent forester proceeding to North America and making suitable measurements on the spot. Such a step was actually taken, in 1885, by Dr. H. Mayr, a Bavarian forester and botanist. He visited the localities in which the Douglas Fir thrives best, and he has promised to publish the information which he has gathered. So far, however, he has only favoured us with a few notes published in forest journals, and, as he has proceeded to Japan, as Professor of Forest Botany in the Japanese Forest School, his experience of the Douglas Fir may not become available for years to come.

Pending further investigation, I may be permitted to gather together what useful information is available at present, and to draw such conclusions as may appear permissible. The following information is at my disposal:—

\* Much general information is, no doubt, available, but for the present object only actual measurements can be used.

- (1.) Measurements in the Taimount plantation.
- (2.) Height growth of two Douglas Firs on the same estate, planted in 1834.
- (3.) Information supplied by Dr. H. Mayr.
- (4.) Examination of a section of a full-grown Douglas Fir, deposited in the Cooper's Hill Forest Museum.

(Ad. 1.) The details of the measurements made in the Taimount plantation have been given above.

(Ad. 2.) The Douglas Firs, planted in the year 1834, were about four years old when planted, so that the trees were about fifty-seven years old in 1887, when they showed a height of about 90 feet.

(Ad. 3.) Dr. Mayr informs us in the *Allgemeine Forst und Jagd Zeitung* of February, 1886, p. 61, that the Douglas Fir reaches the highest degree of perfection in the moist valleys of the Cascade Range Mountains, which run parallel to the Pacific coast. He found that in those localities the average height of full-grown mature Douglas Firs, grown on soil of the best quality, amounts to 215 feet, with a diameter of 6½ feet, measured at 6½ feet above the ground. In the same locality, on gravelly soil, the trees only reached an average height of 148 feet, and a diameter of 2½ feet. Again, in the Rocky Mountains, in Montana, at the same elevation and degree of latitude as on the west coast, the Douglas Fir reaches, on best soils only, the same dimensions as on the gravelly soil of the Cascade Range Mountains, that is to say a height of 148 feet, and a diameter of about 2½ feet. The latter dimensions are not more than what our Silver Fir will attain in localities of the first quality. The part of the Cascade Range, where the Douglas Fir grows, has an annual rainfall of about 2½ feet while in Montana only 24 inches fall. Dr. Mayr believes that the development of the Douglas Fir is proportionate to the rainfall, respectively to the degree of moisture in the air.

(Ad. 4.) The cross-section in question was sent from America for exhibition in Europe; it was then made over to Kew, and by the kindness of the Director of Kew Gardens it was lately presented to the Cooper's Hill Forest Museum. The section shows a total diameter, including the bark, of 7 feet 9 inches, and the counting of the concentric rings indicates a total age of 515 years. A careful examination of the section has yielded the results exhibited in the subjoined table:—

Age in Years.	Diameter in Inches.		Sectional Area in square feet.		
	Total.	Increment during every twenty-five years.	Total.	Increment during every twenty-five years.	Increment during every 100 years.
25	10.9	10.9	0.618	0.618	
50	14.3	3.4	1.115	0.497	
75	18.4	4.1	1.817	0.732	
100	23.0	4.6	2.855	1.038	2.835
125	28.1	5.1	3.715	0.880	
150	29.5	3.4	4.746	1.031	
175	33.0	3.5	5.940	1.194	
200	36.6	3.6	7.306	1.366	
225	41.9	5.3	9.575	2.269	4.421
250	47.1	5.2	12.100	2.525	
275	51.6	4.5	14.522	2.422	
300	56.6	5.0	17.473	2.951	10.167
325	60.7	4.1	20.096	2.623	
350	65.3	4.5	23.186	3.090	
375	69.8	4.4	26.421	3.233	
400	74.8	5.0	30.516	4.095	13.043
425	77.7	2.9	33.928	2.412	
450	81.5	3.8	38.228	3.300	
475	84.6	3.1	39.036	2.808	
500	87.4	2.8	41.663	2.627	11.147
515	89.5	...	43.689		
Including the bark	93.0				

In the first place, it shows that the tree was still making good increment at an age of 515 years, which is higher than that usually attained by the European Larch, Scotch Pine, Spruce and Silver Fir. Secondly, it shows, that the enormously rapid increase of the diameter during the first twenty-five years is suddenly followed by a much smaller and an approximately even increment during each of the following nineteen periods of twenty-five years. I have represented the progress of the diameter increment graphically in the appended drawing, which will give a clear idea of it:—

DIAGRAM SHOWING THE INCREASE IN DIAMETER OF THE TRUNK OF THE DOUGLAS FIR, ACCORDING TO AGE.

Thirdly, the sectional area increases, on the whole, steadily. The periodic increment increases up to the age of 400 years, when it commences to fall. Taken by centuries, we find that the fourth century yielded the largest increment. The appended graphic representation will make this clear:—

DIAGRAM SHOWING THE PERIODIC INCREMENT OF EVERY TWENTY-FIVE YEARS IN SQUARE FEET.

Fourthly, the rate of growth indicated in the section up to the year thirty resembles that of the average tree in the Taimount plantation in a striking degree, as the following figures will show:—  
Diameter of average tree at Taimount } 12 inches.  
at 4 feet 6 inches above the ground }  
Diameter of thirty years' growth on the } 11.9 inches.  
section from America }  
*W. Schlich, Cooper's Hill.*

(To be continued.)

## FLORISTS' FLOWERS.

### THE CHRYSANTHEMUM.

BEYOND attending to the proper watering of the plants—in doing which no water should be slopped about the house—airing the plants, and removing decaying flowers and leaves, nothing more is necessary for the present. Mildew must be sharply watched for, and the sulphur put into use on its first slight appearance. In dull cold weather the plants are better for being ventilated than kept shut up; and to do this it may be needful to have a little heat in the pipes; but there is economy in it, as the flowers last longer, and the plants are healthier.

It is good practice to get the cuttings in as soon

as possible, so that the old plants may be turned out to make room for something else. It is not safe to turn the old plants out-of-doors until the cuttings have all been taken off. Put singly into small pots; they will make roots in a frame or cool greenhouse. Shy rooting varieties should be afforded a mild bottom heat.

### THE PELARGONIUM.

Now that the value of the single and double zonal varieties for winter blooming has been discovered, few gardens are found without them. When arranged with Bouvardias and Carnations they have a charming effect. What with Chrysanthemums, winter-flowering Orchids, and the above class of plants no garden need be without flowers during the next two months. Zonal Pelargoniums, Bouvardias, and perpetual flowering Carnations do well together at this season in a minimum temperature of about 55°, the ventilators being opened a little on every favourable occasion, and allowing a small amount of ventilation at the highest point of the house, at all times. The points of the growing shoots of Pelargoniums ought to be pinched out to cause the flower trusses to develop more perfectly and in greater numbers.

Specimen plants of show Pelargoniums intended to flower early should be repotted into their flowering pots, if this was not done last month. Large specimens are usually flowered in 8½ inch pots, and such plants are usually placed at first in 6 or 7-inch pots. The soil should be in a medium state of dryness, and consist of turfy loam four parts, decayed manure, one part, leaf soil one part, and some sharp sand; a sprinkling of bone-dust may be added, especially for the largest plants, as they are not naturally so vigorous as younger ones. The small-flowered fancy varieties are tenderer than the others, and like a warmer atmosphere. A little peat should also be added to the potting soil to make it lighter. Some few varieties amongst the others are more delicate in constitution, and may require a little more care. Cleanliness, and a free exposure of the plants to light and air are of prime importance. *J. Douglas.*

*VRIESIA WITTMACKIANA* X, *Gartenflora*, t. 1283, October.—A hybrid between V. Barilleti and V. Morreniana. Leaves broad, spineless, with a central two-ranked close spike of oblong boat-shaped bracts, red at the base, yellow at the tips.

## CULTURAL MEMORANDA.

### RUELLA PORTELLÆ.

This is a very useful decorative stove plant, having dark green elliptic-ovate sub-acute leaves narrowing into a slender petiole and a light green mid-rib on either side of which is a narrow white band. The flowers, of a bright rose-pink, are from 1½—2 inches long, and nearly as much broad, hairy, and terminal. The habit is dwarf and compact. It is easily propagated by cuttings put in now, and again in the spring for successional bloom. If the points of the young shoots are inserted in 3-inch pots filled with light sandy soil placed in heat, watered and kept close, they will soon root; after which the points of the shoots should be pinched out, to induce the growths from the base. Pot them off singly a week or ten days later into small 60's, and grow them on in a light position near to the glass. Thus treated nice little plants for flowering next autumn and winter will be secured.

### CENTRADENIA ROSEA.

This spring flowering stove plant is of a dwarf spreading habit and very easy culture. Small plants of it come in very useful for standing round the edges of the staging in stoves and warm greenhouses, or for intermixing with other plants in house decoration. Cuttings put in in the ordinary way, in peaty soil having a surfacing of silver-sand and placed in heat, will soon take root. They should then be potted off singly into 60's, returned to a light position in heat, and watered, afterwards shifting them into 48's as they require it. It produces close heads of pinkish-white flowers. *H. W. Ward.*

### OXALIS BOWLEY.

This pretty Wood Sorrel was commonly cultivated in gardens some years ago, but scarcely ever as a winter bloomer (see p. 501), rather to flower in early summer and on occasionally till August. The bright cerise-pink of the flowers is of a shade of colour seldom met with in greenhouse plants, and the plant on that account, and because of its easy culture, was a favourite with many. The tubers, which are elongated, Pear-shaped, and about 1½ inch long, were potted in autumn if freshly bought in, and kept in a vinery at rest, by preference, but at any rate in a place where the frost did not enter. The soil, a light peaty mixture with plenty of silver-sand in it, was maintained in a dry condition until early in the month of March, when the increasing warmth required that water should be supplied to the soil, which was best done by submerging the pots in a tub for a few moments, afterwards placing them in a greenhouse or newly-started vinery for a short time, and affording water in moderate quantities as the soil got dry. After a little foliage was made the pots were placed in a shallow pit, and kept close to the glass till flowers appeared. It is very essential that the plants be placed near the light, as the leaf-stalks rapidly become drawn when placed far from it, and the beauty of the plant spoiled.

By starting the stock of tubers at two or three times, at intervals of a fortnight, the succession of flowering plants may be extended into late summer. As a rule, tubers that have flowered had better be rested in their flowering-pots, starting them when required, as it is found that to keep a compost, and especially a peaty one, in a quite dry condition throughout the winter, does not improve its condition. The drying off of the tubers in the autumn should be practised in a gradual way, as with Achimenes and other similar subjects. *F. M.*

### PLEIONES.

During the past few weeks these plants have been

the brightest objects in the Orchid house, and as some species are now going out of flower, it may be well to remind those who cultivate them that this is the best time to repot them. Although no leaf-growth is apparent they commence to root immediately, and if disturbed later on some of the young roots are sure to be broken. A compost of loam and peat fibre (two parts of the latter to one of the former) with chopped sphagnum and a little silver-sand, is one that suits them perfectly. Well-drained pans, about 5 inches deep, are well adapted for their culture. After potting, the pans should be placed on a cool, airy shelf, and no water must be given until the young leaves are pushing from the buds, and even then very carefully. Over-watering during the earlier stages of growth is one of the greatest errors in their cultivation. When in full activity, however, Pleiones can scarcely have too much, and manure-water may be frequently given. The most useful species are *P. lagenaria*, *maculata*, and *Wallichiana*; another distinct and desirable species is *P. humilis*. All these are natives of the Himalayas. *W. B.*

### FARFUGIUM GRANDE.

This easily grown plant is propagated by division, the crowns being potted up in small pots in a mixture of three parts light sandy loam and one of sweet leaf-mould, afterwards grown on in a close pit, giving them a position near to the glass to ensure sturdy growth. Shift into larger pots before the roots become matted. It is a dwarf-growing broad-leaved subject, and the fact of its dark green surface being marbled over with yellow renders it a decorative plant of some value. It succeeds in a greenhouse, and requires copious supplies of water after the pots have become well filled with roots.

### HIBISCUS ROSA SINENSIS.

There are now many excellent varieties of this native of the South Sea Islands in cultivation, among which may be mentioned *H. rosa sinensis magnificus*, *H. rosa sinensis fulgidus*, *H. rosa sinensis kermesinus*, *H. rosa sinensis miniatum*, *H. rosa sinensis miniatus*, *H. rosa sinensis vivianus*, all of which produce flowers of great size and brilliancy of colour. The Hibiscus is a remarkably showy stove plant. It is of free growing and vigorous habit, and therefore of easy culture. Cuttings of the young growths having two or three joints, inserted round the edges of 6-inch pots filled with peaty soil, with a sprinkling of silver-sand added, plunged to the rim in sawdust, in a hand-light placed anywhere in heat, watered and kept close, will soon emit roots. They should then be pinched, and a couple of weeks later be potted off singly into 3-inch pots, returned to heat and watered, afterwards shifting them into larger pots as occasion may arise, using three parts of peat and one of fibry loam and sharp sand, and in a rougher state at each subsequent potting. After the pots have become filled with roots, an occasional surface-dressing with Beeson's bone-manure before giving water at the roots, will prove beneficial to the plants. *H. W. Ward.*

## PLANT NOTES.

### CLETHRA ARBOREA.

GREENHOUSE hard-wooded plants in general do not receive so much attention as many of them deserve; the above-named plant, for instance, is one of that class. It is easily managed, and well repays the small amount of labour that it is necessary to bestow upon it by producing an abundance of pretty white flowers borne at the ends of the branches. It is not of a dense habit, and grows from 8 to 10 feet in height. Madeira is its native country, and it belongs to the Heath family. The flowers last in perfection a length of time. Many of the plants of this genus are deciduous, but this is evergreen. It is benefited by being put out in the open in a shady part during the summer months. A mixture of rough loam, peat, and sand (peat predominating), is a suitable compost to pot it with. *W. H.*

### RICHARDIA LEHMANNI.

We received rhizomes of this plant from the Cape of Good Hope, some few months ago, under the name of *R. ethiopia* var. *rosa*. These have since flowered, and specimens have been sent to the Kew Herbarium, and Mr. N. E. Brown has referred it to the above species. We were somewhat sceptical as to its being rose-coloured with us, however permanent that colour may be in its own habitat; as many plants that hail from these bright sunny lands with most beautiful coloured and tinted flowers are quite a failure when an attempt is made to reproduce them in our ever-changing climate. Many instances might be cited of plants that are most gorgeous in colour in their own homes, but which when introduced and grown in our country are almost worthless because they lack the colour they possess in their own countries. In this plant we noticed one flower which had a slight tendency to become rose-coloured, but the rest are white, and with age have a tendency to become green. The leaves are long and narrow, tapering at each end, measuring some 14 inches in length at most, and from 1 to 4 inches in width at the widest part, the petioles being a little longer than the length of the leaves. As far as we are able to judge from our plants, they do not seem very floriferous, but we cannot say definitely as to its capabilities in this direction, as the rhizomes we received were not all of equal vigour. It certainly is a plant well worth growing, and next year we hope to be in a position to say something more of its merits. *W. Harrow, Botanic Garden, Cambridge.*

### DORONICUM PLANTAGINUM EXCELSUM.

This is by far the finest Leopard's-bane, and undoubtedly one of the most showy and useful hardy perennials we possess. It should be grown in every garden, if only for the sake of its lovely flowers for cutting—a use for which they are particularly well adapted. They last for a week in water, and their rich golden yellow colour makes them highly attractive. It has been so frequently described, that little need be added to what has been said before. I enclose a few blooms cut from an open bed, which has been in continuous flower ever since spring, and even now in November they look as gay as ever.

To procure a good supply of cut flowers in early spring, I am now potting up a number of plants in large pots, which I keep in a cool frame during the winter. In early spring I place them in a greenhouse, with but little heat, where they soon send up numerous flower-stems. Thus treated, I always manage to have an abundance of these beautiful blooms before the early spring-flowering varieties, such as *D. austriacum*, *D. caucasicum*, and others, make their appearance. *C. S.*

## GROUP OF ODONTOGLOSSUMS.

[SEE SUPPLEMENTARY SHEET.]

No genus of Orchids lends itself more readily to the skill of a tasteful arranger of plants than the Odontoglossum, it being almost impossible to arrange its arching sprays of handsome flowers in a stiff or ungraceful manner, even when set up without special skill in arranging. A few broad foliage plants at the back, a plant or two of *Adiantum Farleyense* and *A. cuneatum*, a few dwarf *Selaginellas*, some *Isoetes*, and variegated *Panicle*, or so, for the front, the floral part of the arrangement being made up with the handsome snow-white or quaintly blotched *Odontoglossum crispum* and *O. Pescatorei*, and a few rich brown and yellow *O. triumphans* and *O. Illalini*, form a display sufficiently striking to give a good excuse for the enthusiasm of any lover of Orchids. Such a group we depict in our Supplementary Sheet, and such a group is to be met with in scores of our gardens, now that Orchid growing has become a general and not an exclusive fancy in our gardens. Many photographs of effective grouping of Orchids have been sent to us, and from time to time reproduced, acknowledgment to the sender being at the same time made. Unfortun-

nately, in this case we are unable to do so, as the original bore no mark whereby to identify it; all we can say is, that we thank the sender, and shall be glad to state from whose collection the photograph came should the information be forwarded to us.

## PLANTS AND THEIR CULTURE.

**PITCAIRNIA CORALLINA.**—Many of the Bromeliaceae are worthy of more extended cultivation, as in the case of this species, with its long, arching, plicate leaves of a glaucous-green colour on the upper surface, and densely covered with a white powder on the under-side; but although thus ornamental when not flowering, it is much more so during that period. The red flowers are produced in massive racemes about 2 feet long. Both peduncle and flowers are red, and the latter is of considerable size and substance; the three inner pieces of the perianth are the largest, and edged with white. A curious point about the inflorescence is, that shortly after it emerges from the base of the plant it is suddenly bent downwards, which gives it the appearance of being pendulous, but although the raceme is thus bent down, the individual flowers are bent back towards the base of the peduncle, and therefore maintain an erect position, which gives them a singular appearance. They are thus freed from the dense mass of foliage, and are thus seen to the best advantage. The plant is of easy culture, growing freely in the stove in a free fibrous compost. It flowers at various seasons, but usually in spring; however, a large plant growing against the back wall of our Bromeliad-house is, and has been, in flower for some long time, and has had over a dozen of its beautiful racemes of blooms. It is figured in the *Bot. Mag.*, t. 6600. The plant is propagated by division, or from seeds when these are obtainable; but it is practically of caulescent habit, and is readily divided.

**Flower Forcing.**—This department will now require much forethought and energetic management where large quantities of cut flowers are required regularly. It is indispensable to success to look well ahead, and make timely provision for probable requirements. Of course it rarely happens that a quantity of forced stuff turns out just according to expectations under the best management; therefore it is well to put into heat more than are likely to be required, but to avoid over-abundance, especially when Chrysanthemums or other flowers are in season; though there should always be so much material in hand that by retarding or accelerating, as circumstances may require, an unbroken supply may be sustained. In the meantime the earliest batch of Roman Hyacinths and paper-white Narcissus may be removed from the plunging material when sufficiently rooted, and if the leaves are much advanced carefully inure them to the light, and after a few days they may be placed in the forcing house if required soon, if not place them well up to the light in the greenhouse; in either case the flower-spikes will be improved by a watering with weak liquid manure occasionally. Where bicolor potfuls are grown, see that the flower-spikes are afforded some slight support at an early stage, otherwise they will be apt to break off. Of shrubs for forcing one of the best is the common Lilac, and the white variety is usually most prized. Lilac is easily brought into bloom in an ordinary forcing or intermediate house, or other place where the temperature is kept at about 60°. But as the flowers expand care should be taken not to wet them, as they are easily spoiled. The plants should be left out until the leaves have fallen, and I think they seem to force better when they have had a good frost before being lifted. Secure a plentiful supply of Lily of the Valley and Spirea japonica; both are best when started in the dark and in plunging material, as the latter keeps them more uniformly moist at the root. *F. Ross, Pendel Court.*

## FRUITS UNDER GLASS.

**Peaches.**—The early house should now be shut up, the trees being syringed morning and afternoon—the night temperature not being allowed to rise higher than 50°, and a ridge of warm leaves in the centre of the house, will secure this amount of warmth, unless the nights be very cold. It is, however, better to force trees in pots thus early in pre-

ference to exciting permanent trees. If the requisite number of these be available, and are now plunged in warm leaves, they will speedily respond to the process of forcing. The day temperature should not exceed 55° without sun in the earlier stages, and 60° with sun-heat, and with ventilation; but should the thermometer run up to 65° for a short time after closing, and very lightly dousing be afforded with tepid water, no harm will accrue. When airing, guard against cold draughts.

**Succession-houses.**—Give attention to the thorough cleansing of the trees, and doing the little pruning which will be required. Well wash the shoots with a little petroleum, soft-soap, and warm water, laying the shoots on the palm of the left hand, and working the brush upwards. Top-dress as formerly directed, and carefully guard against a too dry state of the soil at the roots. When the trees are in bad soil, no time should be lost in having matters put right, the best plan being to lift the roots, and replant them in better soil. Let the drainage also be seen to. Avoid adding manure to the soil when replanting, but still, if the soil be of a light nature, a little well rotted manure will do no harm if the trees are of a good age; but if they are young it will produce grossness; on the contrary, if the soil be heavy, a liberal amount of charred soil should be added along with plenty of old mortar rubbish, using as a manure, bone-meal. Where the trees have been lifted during the present season and are full of young roots protection must be afforded such, else wet will seriously injure them. Recently planted trees will require a little warmth in the apparatus, with a free current of air even after the leaves may have dropped, in order to properly ripen the growth. In pruning such trees let the knife be used as little as possible even should the shoots be 4 or 5 feet long. The best plan to reduce such grossness is to divert the flow of sap into as many channels as possible, and this can be accomplished when the trees commence to grow by leaving as many side shoots as are requisite for the furnishing of the trellis; cutting back such shoots aggravates in a large measure the tendency to grossness, as the harder a tree is pruned the more does it extend itself, and as long as this tendency remains there is little certainty of obtaining a crop of fruit. On the other hand most of the lateral growths from a strong shoot will set any quantity of fruit buds. *W. M. Baillie, Luton Hoo.*

## THE HARDY FRUIT GARDEN.

**VARIETIES OF PEARS TO PLANT.**—This matter requires careful consideration, as there are many varieties which fail to give satisfaction in the open ground, and in any but very good climates, but which, when they are accorded a wall to grow on, bring their fruit to perfection. When there is in the garden much extent of wall with a southern aspect the choicer late-ripening varieties of Pears may be planted on it, whilst for earlier varieties the other aspects will suffice provided the soil is suited to Pears. The following is a list of select varieties which succeed well either as pyramids or bushes on the Quince, and which seldom fail to bear good crops, viz.:—*Souvenir du Congrès*, Colmar d'Été, *Beurré d'Amélie*, Thompson's, Louise Bonne, *Bermish Beauty*, *Beurré Hardy*, *Beurré Superin*, *Pitmaston Duchess*, *Marie Louise*, *Doyenné du Comice*, *Maréchal de la Cour*, *Durondeau*, *Seckle* and *Dana's Hovey*.

For growing against walls, as cordons, &c.:—*Beurré Giffard*, *Summer Beurré d'Arenberg*, *Beurré de l'Assomption*, *Duchesse d'Orléans*, *Jersey Gratioli*, *Bonne d'Ezée* (Brockworth Park), *Winter Nelis*, *Bergamotte d'Espérance* and *Pitmaston Duchess*. The following will be improved by planting on a south aspect:—*Gansel's Bergamotte*, *Marie Louise*, *Beurré Superin*, *Knights' Monarch*, *Glout Morceau*, *Passé Colmar*, *Olivier de Serres* and *Marie Benoist*. For growing as standards in the garden and orchard:—*Williams' Bon Chrétien*, *Windsor*, *Swan's Egg*, *Autumn Bergamotte*, *Fertility*, *Jargonelle* (this does well on west aspect in northern counties), *Beurré de Capiaumont*, and *Louise Bonne*, are about the best.

**Apples.**—This fruit is not so fastidious as to soil as the Pear, and it will grow in almost any kind of soil, providing it is not a wet one, but where Apples are not usually in England planted, is against walls; but if this can be done, a few of the choice dessert kinds so treated will repay the trouble taken. Some of the finest and most highly-coloured fruits of Ribston

Pippin and Peasgood's Nonsuch I ever saw were grown against a wall.

The following is a list of the best and most sure-cropping culinary Apples in the West, and perhaps generally over the country:—*Lord Suffield*, *Potts' Seedling*, *Stirling Castle*, *Cellini*, *Cox's Pomona*, *Small's Admirable*, *Echlinville Seedling*, *Warner's King*, *Prince Albert*, *Beauty of Kent*, *New Northern Greening*, *Mère de Ménage*, *Yorkshire Beauty*, *Winter Hawthornden*, *Hanwell Souring*, *Wellington*, *French Crab*, and *Norfolk Beaufin*; and for dessert:—*Juneating*, *Worcester Pearmain*, *Red Astrachan*, *Quarrenden*, *Fearn's Cox's Orange*, *Ribston*, and *King Pippins*; *Seek-no-Further*, *Pine-apple Reinette*, *Reinette du Canada*, *Duchess of Oldenburg*, *Herefordshire*, and *Lamb Abbey Pearmain*, *Summer*, and *Franklin's Golden Pippins*, *Ashmead's Kernel*, *Scarlet Nonpareil*, and *Blenheim Orange*.

Of newer varieties the following are worthy of a place in any collection:—*Beauty of Bath*, *Schoolmaster*, *The Queen*, *Sandringham*, *Bismarck*, *King of Tomkins County*—in warm parts of the country only; *Gascogne's Scarlet Seedling*, and *Lady Sudeley*. *A. Ward, Stoke Edith Park.*

## THE KITCHEN GARDEN.

**SMALL SALAD.**—This is easily grown during the summer months by the merest novice, but its cultivation in winter is a very different matter; even in the best regulated establishments it is capricious at times, and not always to be had when required. The best system of cultivation I have met with is to sow in boxes about 3 inches deep, and nearly of the size of large blue roofing slates; the size of the latter varies a little with the sort, and they form one of the best coverings for the seed-boxes. These should be filled with a light compost, pressing all in firmly with a brick to within three-quarters of an inch of the top, leaving a smooth even surface. A very slight sprinkling of fine soil should be evenly distributed over this, and the whole well soaked with tepid water. As soon as this has drained through the box the seed may be sown, and in doing this it is well to sow more thinly than is usual during the summer months. No soil should be placed over the seed, but the slate placed over the box at once, before the surface soil gets dry, and kept there until the young plants are almost touching it; the boxes should then be placed where they will receive a good bottom-heat—for instance, over the pipes of a forcing house, where a minimum temperature of 65° is maintained, with a couple of bricks beneath to keep them from touching the pipes. Here they should remain until the seed is germinated and ready for the slates to come off. If the latter fit the boxes closely no water should be required after the seed is sown. Damping-off, which is often very troublesome in the winter season, is almost certain to ensue if any water is given. The slates should be removed gradually by raising them a little in the first instance, so as to inure the plants by degrees to the air and light. After the slates are removed the boxes should still remain in the same house at this part of the year, as any check to the growth causes damping at once. It is very important that none but new seed should be sown during the winter months, that which is old or has been in a damp place is sure to cause disappointment. The above remarks apply to both Mustard and Cress. The former should be sown about eight days before required for use, and the latter requires three or four days longer before it is ready. *W. H. Divers, Ketton Hall, Stamford.*

**PRIZE SHOW OF ONIONS.**—Encouraged by the success of their annual shows of Leeks and Cabbages, Messrs. Stuart & Mein, seedsman, Kelso, resolved to hold a show of Onions on the same lines, viz., that the exhibits be grown from seed supplied by the firm. The competition, which took place on Friday, November 2, in Messrs. Stuart & Mein's premises, was open to the United Kingdom, and a good number of exhibits were sent from various parts of England and Scotland. Some heavy, well-matured bulbs were shown. The following were the prize-takers:—1st, Mr. E. S. Wiles, Edgemoor Gardens, Banbury; 2nd, Mr. S. Buglas, Old Town, Ayrton; 3rd, Mr. Charles Harris, Crossford, Lanark. The 1st prize lot weighed 18½ lb., averaging over 1 lb. per bulb.

Advertisers are specially requested to note, that, under no circumstances whatever, can any particular position in the paper be guaranteed for advertisements occupying less space than an entire column.

#### SUBSCRIBERS TO

**THE GARDENERS' CHRONICLE** who experience any difficulty in obtaining their Copies regularly, are particularly requested to communicate with the Publisher (in cases of delay in the delivery by post, the cover should be forwarded with complaint).

W. RICHARDS, 41, Wellington Street, Strand, W.C.

#### NOTICE TO SUBSCRIBERS AND OTHERS.

Post-office Orders and Postal Orders should be made payable at the Post Office, No. 42, DRURY LANE.

Now ready, in cloth, 11s. 6d.

**THE GARDENERS' CHRONICLE**, Vol. III., Third Series, JAN. to JUNE, 1888, W. RICHARDS, 41, Wellington Street, Strand, W.C.

### APPOINTMENTS FOR THE ENSUING WEEK.

#### MEETING.

WEDNESDAY, Nov. 21. National Chrysanthemum Society: Floral Committee.

#### SHOWS.

TUESDAY, Nov. 20. Edinburgh, Liverpool, Henley (two days each), and Oxford.

WEDNESDAY, Nov. 21. Birmingham, Rugby (two days each), Croydon, Bristol, and Banbury.

THURSDAY, Nov. 22—Hull (two days).

FRIDAY, Nov. 23. Pontefract, Bolton, and Stockport (two days each).

#### SALES.

MONDAY, Nov. 19. Dutch Bulbs, at Stevens' Rooms, Dutch Bulbs and Lily of the Valley, at Small's Rooms.

Dutch Bulbs, at Protheroe & Morris' Rooms.

TUESDAY, Nov. 20. Nursery Stock from sample, at Protheroe & Morris' Rooms. Roses, Plants, &c., at the City Auction Rooms, by Protheroe & Morris.

Dutch Bulbs, Lillium auratum, and named Standard and Dwarf Roses, at Stevens' Rooms.

WEDNESDAY, Nov. 21. Dutch Bulbs and Lily of the Valley, at Small's Rooms. Lillium auratum, Azaleas, English grown Lilies, &c., at Protheroe & Morris' Rooms.

Nursery Stock, at the Burnt Ash Hill Nurseries, Lee, by Protheroe & Morris (two days).

THURSDAY, Nov. 22. Dutch Bulbs, at Protheroe & Morris' Rooms. Leasehold Nurseries, at Finchley Road, by Protheroe & Morris.

FRIDAY, Nov. 23. Dutch Bulbs, at Protheroe & Morris' Rooms. Dutch Bulbs and Lily of the Valley, at Small's Rooms.

SATURDAY, Nov. 24. Imported Orchids, at Protheroe & Morris' Rooms. Dutch Bulbs and named Standard and Dwarf Roses, at Stevens' Rooms.

A Palliative for the Potato Disease.

A USEFUL piece of work has been accomplished at Chiswick this year, and one which illustrates our contention as to the use that may be made of the gardens as an experimental station. To make the matter intelligible we must go back to the years 1884 and 1885. In those years very elaborate experiments were carried out in order to test the value of the Jensenian system of moulding as a preventative of the spread of the Potato disease, and the results were as elaborately classified and noted under the direction and personal superintendence of a sub-committee of the Scientific Committee of the Royal Horticultural Society. A summary of the results obtained was given in our columns, January 9, 1886, p. 51, showing:—1, the methods of conducting the experiments; 2, the amount of produce under the varied conditions of the experiments; 3, the

comparative effects of long or of short periods of earthing-up or of not earthing-up at all; 4, the consequences of bending the haulm; and, 5, the results obtained from planting whole tubers and cut sets respectively. Interesting as these results were, they failed of their primary object because the development of the fungus in those years was so slight that no trustworthy information was afforded by the experiments as to the effect of the new system of moulding in preventing the spread of the disease. Discouraged by such a result, the sub-committee, consisting, as it did, of busy men, all living at a distance from the garden, and all fully occupied with their own concerns, did not attempt to repeat the experiments in 1886 or 1887; and so far it is fortunate they did not, as the amount of disease in those years was also inappreciable. This year, however, circumstances turned out somewhat differently, and what happened was detailed in a short report presented to the Scientific Committee at its meeting on Tuesday last:—

"During the present season the Potato disease set in at Chiswick with virulence about July 29. Up to that time no attempt had been made to check its course or to note the conditions under which it occurred; but, at the suggestion of Mr. PLOWRIGHT, two rows in juxtaposition were submitted to experiment on August 10. The rows were 30 yards in length, the variety selected was Schoolmaster, and the conditions were as absolutely identical as possible, except that the one row was left moulded in the ordinary way, while the other was 'high-moulded'—that is to say, banked up on one side to form a ridge, while the haulm was slightly bent over to the other side. In the ordinary system of moulding, a furrow is left along the top of the ridge into which it is surmised that the spores must fall, washed off by rain or otherwise from the foliage. The high moulding, it is supposed, obviates this by securing the fall of the spores on the ground between the rows, and not on the rows themselves.

"As the disease appeared to be equally severe on both rows, and was, moreover, far advanced, but little expectation was indulged in that the results would be of any value. Nevertheless, on September 29, the Potatoes in the two rows were lifted and examined, as dug, by Mr. BARNON and Dr. MASTERS. It speedily became apparent that there was a considerable difference between the two rows, and that the tubers from the high-moulded row afforded a cleaner and more even sample. With a view to put this general impression to a numerical test, fifty tubers from each row were taken indiscriminately, twenty-five by one observer, the remainder by the other, so as to equalise, as far as possible, the 'personal equation.'

"These hundred Potatoes were then examined with a more careful scrutiny, each one being cut open to ascertain whether or no it was diseased. The result was as follows:—

"Out of fifty taken from the row moulded in the ordinary way, thirteen were found diseased, or 26 per cent.

"Out of fifty taken from the high-moulded row five only were noted as diseased, or 10 per cent.

"No doubt a more careful examination by the microscope would have indicated a larger proportion of disease in each case, but it is not likely that it would have very materially altered the proportion either in one direction or the other. In order, however, to obtain further information upon this point, twenty-five tubers from each row were put aside for future examination, and these being examined on November 10, gave the following results:—

"Of the twenty-five taken from the row earthed up in the usual way thirteen were diseased and twelve sound.

"Of the twenty-five taken from the row earthed up in the Jensenian manner on August 10—when, as before said, the haulms of both rows appeared

equally rotten with disease—all the tubers were sound."

Of course it will be urged that this is only one experiment, and one only on a small scale, and that results might be different under other circumstances. Probably they would. Nevertheless, the experiment of 1888, surprising as it is in the uniformity of its result, is in strict accordance with the indications afforded by previous trials in the same direction at Chiswick and elsewhere, and we venture to think it is one well worthy the attention of practical men. It must further be recollected that the early experiments at Chiswick were conducted at an expenditure of time and labour which would have been quite impracticable from a commercial point of view; indeed, the cost of the experiment for the purpose of those experiments was designedly put out of consideration; but in 1888 the startling results obtained were gained by an expenditure which need not have exceeded, or only to a trifling amount, that ordinarily expended. The experiment, in fact, shows that even in the most advanced state of disease, so far as the haulm is concerned, a large proportion of the crop may be saved—one far larger than when the ordinary system is practised.

The Royal Horticultural Society.

ANYONE who chanced to look in at the Drill Hall on Tuesday last would have imagined that the old

Society was indeed at its last gasp. Anyone, however, who happened to step across the street to the offices at 111, Victoria Street, would have come to a very different conclusion. From morning till a late hour in the afternoon, business of a very serious and important character, was in progress, and that it was both serious and important was proved not only by the numbers present, but by the character of the work done. The first business of a day crowded with work was the consideration of the question as to whether the meetings, or any of them, should be held at Chiswick, or whether all the meetings (as distinguished from exhibitions) should be held in the Drill Hall, or elsewhere. The meeting was opened by a speech from the President setting forth the objects of the meeting, a speech in which the claims of Chiswick certainly were not advocated with much zeal. Probably the President's remarks were based not entirely on his own personal convictions, but on the results of certain letters from influential exhibitors and others, the general result of which may be summed up in the statement that of twenty-nine letters received, eighteen were against meeting at Chiswick for various reasons assigned, and eleven in favour. This verdict presumably came from the trade and professional exhibitors, who were naturally thinking of "big shows," and of their own interests in connection therewith. The exhibitors of this class have been such staunch supporters of the Society, and their claims are so legitimate, that there is not one word to be said against them. Nevertheless, the Society does not exist for the sake of the exhibitors, nor does it appeal for public support because it holds flower-shows in which the interests of trade and professional exhibitors are more particularly involved. These do not by any means constitute the whole, or even the greater part of the objects for which the Society exists. Nor can a word be alleged against the propriety of holding occasional shows, large and small, in more central localities, and therefore more generally accessible to the exhibitors and to the general public. If big flower-shows and the award of prizes and certificates to clever gar-

deners and successful traders were all that were aimed at, the shows might be held at the Crystal Palace, the Aquarium, or any other convenient locality. The work of organising them and of awarding them might be undertaken, as indeed, it is already, by special societies like the Rose Society, the Chrysanthemum Society, and the now numerous organisations which threaten to outgrow their original limitations and to become general in their aim. General, however, only in the flower-show sense—not general in so far as the interests of horticulture in a wide sense are concerned. But in the case of the premier society the public has a right to look for broader aims and a more comprehensive scope. If these be not forthcoming, the Society, were such an operation possible, might as well—nay, rather had much better—be dissolved. Horticulture, as far as its public manifestations are concerned, would then be reduced simply to the bazaar element. Does anyone wish this? We think not, and we are supported in our opinion, first, by the unanimous vote in support of Mr. MALCOLM DUNN's resolution at the Chiswick Apple Congress, and specially—(specially because the meeting was convened for the express purpose of taking the vote on this particular subject)—because, the same verdict, after various other proposals had been made, was pronounced on Dr. MASTERS' resolution on Tuesday last. This was to the effect, that the Council be requested to make arrangements for the holding of a certain number of meetings at Chiswick during the ensuing summer and autumn. This proposal was advocated because it does not clash with any other, but particularly on the ground that it is desirable that the Fellows and the public should have an opportunity of seeing what the Society does at Chiswick. There is ample opportunity of seeing what the exhibitors can do, either at Chiswick or anywhere else; but what the Fellows have a right to demand is, that the Society itself shall do something towards carrying out the object for which it was founded—the advancement of horticulture, and that they shall have the chance of seeing and appreciating what the Society is doing. Of course this implies that the Society is already doing something at Chiswick. Those few who frequent that establishment know that a good deal is done, but they also know and feel that a good deal more might advantageously, and we may add profitably, be done there. The articles and letters in our last and in our present issues indicate what might and ought to be done.

That this view is substantially correct and in harmony with the feeling of the general body of horticulturists is shown, as we have said, not only by the results of the meeting at the Apple Congress, but specially by the vote taken on Tuesday last. In spite of the objections and doubts raised in all good faith by the President and Secretary, Dr. MASTERS' resolution was carried with one dissentient only.

It remains now for the Council to do their utmost to develop the resources of Chiswick, and to make arrangements for the holding of certain meetings during the year in the old home of the Society. This can be done without in any way interfering with the wishes of the exhibitors as to any meetings or shows which it may be deemed desirable to hold elsewhere. It pledges the Society to nothing further than that some meetings should be held at Chiswick. It may here be stated that some meetings of the Committees are already held during the season at Chiswick to inspect the trials of flowers, fruits, and vegetables, that take place there annually. Ex-

tend these meetings, give the Fellows an opportunity of seeing and appreciating what is being done in their interests and in that of horticulture, and the desired result will be obtained; only the scheme must be entered into in no half-hearted way, but with a resolute intention to achieve success as far as that may be possible.

The meeting of the Scientific Committee on this occasion was noteworthy for the report of some recent trials of the efficacy of the Jensen system of moulding, as narrated in another article. The doings of the other two committees are also reported in another column.

Here, too, we may allude to the meeting held to confirm the bye-laws. This meeting was well attended, and various points were discussed rather unnecessarily this time, as the laws in question had been, line by line, examined and re-examined by the Council, by the Committee of Fellows, and by the solicitors. The bye-laws are not all that could be desired; exception was taken to some of them—justly, perhaps, in the abstract—but still, after the assurance that all had been done in the way of scrutiny and revision that the charter would permit, it was ill-timed to persist in raising objections against the repeated expressions of opinion of the President and Secretary, who, knowing all that had been done, were in a position to speak with authority that ought to have been beyond question. At length, however, the bye-laws were passed, and now the Society must get on as best it can till the opportunity comes for applying for a new charter. That opportunity, it is universally admitted, does not present itself at the present time.

Lastly, and by no means least, the thanks of the community are due to the Council, who have, since they took office, laboured, with an assiduity beyond all praise to put the Society on a better footing, and who have succeeded to a degree that is not only astonishing, considering the time at their disposal, but which was considered by many to be impossible.

**GIFT OF A PUBLIC PARK.**—Sir JOHN HARDY THURSNY, of Ormerod House, Burnley, who was High Sheriff of Lancashire in the Jubilee year, has presented to the town of Burnley, through the Mayor (Alderman STURCLIFFE), 28 acres of land, near the centre of the town, as the site for a public park. The value of the land is estimated at over £25,000.

**HORTICULTURAL EXHIBITION, BERLIN, 1890.**—With the year 1890 a period of five years will have elapsed since the last great exhibition of the *Vereins zur beförderung des Gartenbaues in den Preussischen Staaten* was held, and now we find before us the provisional programme of another still more extensive. In one direction the exhibition is intended to illustrate the intimate connection between architecture and horticulture, and in this department it has already received the support of many competent persons. The schedule above-mentioned falls into eight chief divisions, viz., flowers and plants, and under these are decorative group novelties of the warm-house, of the greenhouse, of open-air plants, and of Orchids. Warm-house plants take 235 classes, greenhouse and out-of-doors plants, 377 classes; nursery commodities, 81; fruit, including articles made from the same, 25; vegetables, 16; and garden plants, 5 classes. Under the head of architecture and tools, implements, engines used in horticulture, there are 36 classes. The following section of the exhibition includes in its 59 classes plant morphology, anatomy of plants, growth of plants, physiology, instruments, and methods of research; useful and poisonous fungi, official and important technical plants, seeds, plant geography, &c. The exhibition, which will be open to all nations, will be held in the large premises of the Royal Exhibition buildings at the Lehrter Railway Station.

**CHRYSANTHEMUMS AT MOOR PARK, RICKMANSWORTH.**—A fine display of nearly 1000 plants in 200 varieties has been arranged in the various large houses of this well-known garden. The most beautiful varieties of the Chrysanthemum, in reflexed, Japanese, Anemone, &c., are well represented, exhibiting a fine display of colour. The groups are edged with well-grown plants of various winter-flowering plants and bulbs, which form a tasteful finish. Lord ENURY has kindly permitted the collection to be open to inspection by the public for the next week or so—a privilege lovers of the Queen of Autumn will be delighted with many of the new sorts that Mr. MUNDELL has grown this year.

**CARNATIONS AT CHISWICK.**—We learn that the proposal made in these columns recently with respect to having a trial of border Carnations at Chiswick next summer has been duly considered, but it being thought too late to arrange for its conduct next year, it has been determined to hold such trial in 1890. In the meantime it is to be hoped that proper conditions governing the trial will be elaborated and published in due course, and thus ensure the success of what could hardly prove to be other than of exceeding interest to all horticulturists.

**BOTANICAL MAGAZINE.**—The following plants are figured in the November part:—

*Phaius Wallichii*, t. 7023.—A large-flowered terrestrial Orchid, native of tropical India, with plaited leaves, and erect racemes of flowers, perianth  $2\frac{1}{2}$  inches across, segments spreading lanceolate, chocolate-brown, with a narrow yellow edge; lip convolute, limb oblong, spreading, flat, violet, with a yellow blotch, and purple nerves. The colour of the flower is variable, as is also the tip of the lip.

*Peumus fragrans*, t. 7024.—A Myrtle-like shrub belonging to the order Monimiacaceae, and remarkable for the delicious fragrance of its foliage and wood, and much valued in Chili for the manufacture of charcoal. The aromatic fruits are eaten; they attain the size and appearance of black haws, and the bark is used for tanning purposes. Kew.

*Iris Korolkowi*, t. 7025.—A species from Turkestan, with lilac ovate-acute standards, with a purple fringe at the base, and erect, oblong-acute, lilac standards. At the same time is figured a self-coloured variety from Professor Foster.

*Calanthe striata*, t. 7026.—A Japanese species, with leaves plicated, with erect, many-flowered racemes; flowers  $1\frac{1}{2}$  inch across, segment, spreading, oblong, brown in the centre with narrow yellow margins; lip broad, roundish, deeply 3-lobed, with three projecting lobes on the central lobe. Kew.

*Agave Ellenbeckiana*, t. 7027.—Leaves narrow, lanceolate-acute, very fleshy, spineless, with a long, erect, cylindrical raceme of greenish flowers with very long projecting stamens and style. Kew.

**THE CELEBRATION OF THE CENTENARY OF THE INTRODUCTION OF THE CHRYSANTHEMUM TO EUROPE.**—It having been suggested that as the Chrysanthemum was introduced to Europe in 1789, its centenary should be celebrated, a preliminary meeting of representatives of Chrysanthemum Societies, judges and others, was held at the Crystal Palace on the 9th inst. Mr. E. SANDBERSON, President of the National Chrysanthemum, in the chair. After some discussion it was proposed by Mr. JOHN LAING, seconded by Mr. WILLIAM EARLEY, and carried unanimously:—"That considering the year 1889 is the centenary of the introduction of the Chinese Chrysanthemum to Europe, it is advisable that the National Chrysanthemum Society be requested to prepare a scheme for the proper celebration of this event."

**EXTRAORDINARY CARROTS.**—At Waereghem, in Western Flanders, according to the *Bulletin d'Arboriculture*, a Carrot has been lately exhibited 1 metre 45 centimetres long; while at Beveren, in the same province, a Turnip has been shown measuring more than 1 metre in circumference. These giants recall

the advertisements of the Mangels of such dimensions that sheep were grazing placidly on the roots while overshadowed completely by the foliage.

**TEDDINGTON CHRYSANTHEMUM SHOW.**—This was held on the 8th inst., and was well attended. Mr. G. A. Bishop, The Grove Gardens, Teddington, won the Challenge Cup, with a good stand, and other leading exhibits were from Messrs. Munro, Bates, Coombs, and Allen. In the section for fruits and vegetables the chief prizes were taken by Messrs. Bates, G. Smith, C. Garrod, W. Pain, T. Furrow, and J. Furrow. Cottagers and amateurs were well represented, and table decorations, bouquets, sprays, &c., were pretty.

**PHALÆNOPSIS AMETHYSTINA.**—Of this little gem—for such it must be described, being both small and elegant—two plants may now be seen flowering at Kew. An erect peduncle of but a few inches high is thrown out of the tuft of leaves, on which the flowers are borne. The sepals and petals are white, the front lobe of the lip rosy-purple, while the side lobes are beautifully marked with radiating lines of the same colour on a white ground. A woodcut of the plant may be found in the *Gardeners' Chronicle* for 1870, p. 1731. The native country has been somewhat vaguely stated as Sondaic Islands.

**INSECTICIDES.**—Mr. A. J. Cook, the Professor of Zoology and Entomology at the Agricultural College of Michigan, relates in the *Bulletin* of the College for September, that, "it pays remarkably well to spray" Apple trees to prevent the injuries inflicted by the Codlin moth. The poison used is arsenite of lime (London Purple), used in the proportion of one pound to 100 gallons of water. The spray should not be used till after the blossoms fall from the trees. "Spraying with insecticides is becoming exceedingly profitable," says the Professor. The pump used is a force-pump, which might be bought by one farmer and lent out to his neighbours, or purchased by co-operation. The spraying may be repeated once or twice in the course of the season. Obviously, it should not be used except when the fruit is in a very young immature state.

**JULIETTE DORDON.**—Among the new Chrysanthemums this is remarkable for the concentric way in which its colours are arranged; thus, the centre is white, surrounded by a broad belt of lilac, while the tips of the florets are white, thus forming a third circle outside the others.

**TUORO CHRYSANTHEMUM SOCIETY.**—The Tuoro people have established a society for the encouragement of the cultivation of the Chrysanthemum, and held their first exhibition on Tuesday and Wednesday, November 6 and 7. The show was regarded as a success by its authors, but the account of it sent to us would seem to point to the fact that a few cultivators took the lion's share of the prizes—a matter that will probably right itself in the future, when more competitors enter the field, and methods of growing and showing the flower are better understood.

**DEVIZES CASTLE GARDENS.**—Mr. THOMAS KING, who has had charge of these gardens for so many years, has made arrangements to take these into his own hands, for the purpose of growing fruit and flowers for market. As the present proprietor of the Castle does not at present intend to make it his residence this arrangement has been come to.

**SPHINCTER GRIP ARMOURD HOSE CO.**—This Company, with its rather grim title, is making a special issue of 25,000 shares of £1 each, in order to develop the resources of the Company, and enable it to meet the great demand upon its manufacturing capacity. The office of the Company is 63, Fore Street, E.C.

**PUBLICATIONS RECEIVED.**—*Native Flowers of New Zealand*, by Mrs. C. Hetley, part iii. (London: Sampson Low & Co.)—*Cultural Directions for the Rose*, by J. Cranston, 7th ed. (Hereford: King's Ace Nurseries).—*The Invisible Powers of Nature*, by E. M. Caillard. (London: J. Murray, Albemarle Street).—*The Orchids of the Cape Peninsula*, by Harry Bolus, F.L.S. (Cape Town, Cape of Good Hope.)

## CHISWICK.

DEAR old Chiswick, "the Kew of horticulture!" Your leading articles (p. 540), and Mr. Dyer's remarkable letter in your last issue (p. 536), will, it is to be hoped, induce the Council of the Royal Horticultural Society and the Fellows generally to strain every nerve to raise their classical old garden into an institution of national importance and utility. Some portions of Mr. Dyer's letter might have been left unwritten with advantage, especially the innuendo that "in horticulture" opinions very seldom agree, seeing that the same is quite as true "in botany" or any other pursuit, as in gardening. After all, is not a healthy, frank, and courteous difference of opinion the very life and strength of any body of men working for a common cause? While I object strenuously to some points in the letter referred to, I cordially agree with Mr. Dyer's main policy, that Chiswick should become to all intents and purposes the Kew of horticulture. This much is also, as I presume, the idea of the majority of those in any way interested in the question now raised.

Mr. Dyer's suggestions in the main are so good that I wish he had gone a step further in his suggestions, and given us his views as to the ways and means necessary for carrying out horticultural work and experiment in the Chiswick garden. Mr. Barron has done all that a man crippled for want of necessary funds could do to make Chiswick interesting, and the main difficulty with which the best friends of Chiswick have to deal is the question of funds. Money may, as wrongly applied, be "the root of all evil," but the want of it is, and has been of late years, equally against the Chiswick garden ever being "energetically worked in the spirit" which Mr. Dyer advocates so as to make of it "a really living thing." If a policy were all that the Council of the Royal Horticultural Society wanted at the present moment, Mr. Dyer's letter full as it is of acute suggestiveness, would be most satisfactory; but, as I have said, how can the requisite funds be obtained to restore Chiswick, and raise it to its proper position as an educational establishment on a par with Kew? Chiswick for gardening, and Kew for botany, is a dream we should like to wake up and find a true one. We are all very proud of Kew as the finest botanical garden in the world, and some of us know what it has cost Mr. Dyer to bring it up to its present rate of efficiency, but we do not forget that Kew has the benefit of a Government grant of £20,000 a-year, more or less. If "dear old Chiswick," under Mr. Barron's superintendence, could have had a half or a quarter of this sum annually for the past twenty years, there would have been little necessity for a policy to-day.

This brings me to a point worth some attention from the real friends of the Royal Horticultural Society at the present time. Mr. Dyer has distinctly shown that between Kew and Chiswick a division of labour and public utility could be carried on with national advantage. This being true, it follows that Chiswick may be as deserving of a Government grant on the one side as Kew is on the other. Now comes the vital question.—Can a Government grant be obtained for the Chiswick garden by the Royal Horticultural Society? Of course, I know that it will be a difficult thing to obtain; but the results are so promising, that such a subsidy from the State is worth striving for. But while working for and awaiting State aid, we must do the best we can for ourselves; and the Society must—as I believe it now really does (see p. 542)—recognise the main fact that its own claim for support and usefulness is entirely based on its garden at Chiswick and the work it can do therein. At present, I am afraid the Council of the Royal Horticultural Society are in much the same plight as the Israelites in Egypt, that is to say, we are all like the taskmasters eagerly demanding our tale of bricks, while denying the straw with which to make or bake them! The strenuous exertions made by the Council of the Royal Horticultural Society and others interested during the past year, are known only

to a few, but it is the general desire of all the friends of gardening that their efforts be successful. Amongst the failures the gloomy and deserted "Drill Hall" is, perhaps, the worst, and the one to be least regretted. My own notion is that, better attended and certainly more profitable meetings could be arranged in the Chiswick Garden—a garden, I am sorry to add, almost unknown to and unvisited by gardeners and the owners of gardens, as a body, when they take a holiday in town. The holding of meetings at Chiswick would lead to the advertisement of the Society's garden, which would soon become popular, and it might even derive some profit as a place of public resort by residents in its now populous and not unhealthy neighbourhood. It is pleasant to know that at the meeting of the Royal Horticultural Society's Council, held on October 31, the following resolution was passed—"That the Council of the Royal Horticultural Society fully appreciate the value attached to Chiswick garden, and are anxious to extend and develop its resources to the greatest possible extent for the advancement of horticulture as far as the means placed in their hands will allow." The italics are my own, and really prove, or at least indicate, pretty clearly, that a want of sufficient fund is at the bottom of the whole difficulty. F. W. Burbidge.

— Suggestions for making Chiswick Garden more useful and more attractive are now taking a practical form. We may hope that Mr. Thistleton Dyer's article in the *Gardeners' Chronicle*, and the Editor's comments upon it will be carefully considered by the Council of the Royal Horticultural Society.

While entirely agreeing with the proposals to establish trial grounds for fruit trees and vegetables, I leave this part of the subject to experts in kitchen gardening; but hardy herbaceous gardening is my particular hobby, and I cannot lose so good an opportunity of pleading for this being made a speciality at Chiswick.

There is not, as far as I know, any public garden in England where a collection of choice and uncommon hardy plants is grown in such a way as to display them to the best advantage, and to make them attractive to visitors. As Mr. Dyer says, Kew cannot be expected to supply this want. Botanic gardens must contain curious and rare as well as decorative plants, and when, for the sake of helping to instruct, specimens are grouped together in natural classes, the difficulty of making them ornamental is increased. Strangers who go to Kew only to see beautiful flowers are not edified by whole beds of Hemlocks, and Figworts, and Goosefoots, and Docks, which all the same help to make our national botanic garden contain the best collection of living hardy plants in the world. But visitors would very gladly go to Chiswick to learn what hardy plants are ornamental, and how they may be best displayed, and from Chiswick all weedy subjects would be excluded.

What I wish to propose may be done with very little expense and labour, if only sufficient space in a suitable situation can be supplied. As I have only been in Chiswick garden once in my life, I cannot from memory enter into local details, but I remember thinking that there was a great deal of room in the flower garden for more and for better flowers. This was perhaps ten years ago, and it may be different now. However, we should want for our purpose three or four long borders, either backed by shrubberies or open on both sides, and entirely free from the roots of trees. Aspect is of some importance, a long front to the east being by far the best. We will suppose these borders to be each 40 yards long, and about 3 yards wide, and four in number, so we ask for just one-tenth of an acre of surface. Allowing an average of 2 feet square for each specimen—some would take much more, and some much less—we should have room for more than 1000 plants. This would probably be twice as many varieties as we should wish to grow at once, but some kinds might be grown in more than one place. The selection of plants would be an important matter of detail; still more important would be the

amount of space assigned to each plant, to show it off to the best advantage, but the whole of each border should be planted at one time, and no vacant spaces left, but all vacancies noticed each spring should be at once filled with something suitable to them. The duration of each border should average perhaps four years; the borders should then be replanted in turn, one each year, leaving unmoved all such plants as continue in the same spot for many years without deteriorating, such as Oriental Poppies and *Fraxinellas*. This renewal of at least one of the borders each year would give the opportunity for excluding plants of doubtful merit and introducing new varieties.

There would be no difficulty in furnishing the borders. It would not, for instance, be a hard condition to make that a specimen of every hardy plant receiving a certificate from the Society should be sent to the garden; or, still better, that the plant should be proved in the garden before granting the certificate, which, of course, would be given to him who sent it first. A further question would be—what florists' flowers, if any, should be admitted to these mixed borders? Such plants as florists' Irises, as well as *Pæonies* and *Phloxes*, and all the Carnation tribe, are better when grown by themselves. Perhaps an ornamental border would hardly be complete without *Delphiniums*; if, however, room should be found for a very limited number of the choicest kinds, they should be from time to time superseded as fast as improvements take place. Nearly all bulbs should be excluded. If once introduced, it is hardly possible to prevent their becoming mixed with the soil in digging, and *Crocuses*, *Snowdrops*, *Daffodils*, and *Squills* coming up from an unknown depth all over the border, and defying extraction, spoil its appearance. Exceptions might be made in this rule.

Varieties improved by cultivation from specific types, other than florists' flowers, should be especially encouraged, and so should any hybrids of merit; but every unknown plant sent should be grown for at least a year in some spare piece of ground to test it before being promoted to show borders. The Editor of the *Gardeners' Chronicle* has shown how great an advantage it would be to have an opportunity of reducing garden plants to a uniform standard of nomenclature. The climate of Chiswick also affords a fair standard for testing their hardiness.

The cost of maintaining these borders would be small. On starting them we should want one or two tons of hurdle bar-iron, of various thickness, and cut into various lengths, worth about £7 a ton; after this the only material required annually would be a few pounds of soft string. But besides weeding and watering, a little skilled labour—that is, a simultaneous use of the hands and the head, combined with some knowledge of the habit of each plant—will be required once a week through the summer for tying up the tall specimens. Few but experts know the enormous difference in the effect produced by good and bad tying. It really takes very little more time to tie well than to tie badly, but it takes more rods. A clever hand can make his *Michaelmas Daisies* in October half cover the area of a border, where in August there seemed hardly room for their stalks to grow up amongst the other flowers.

But perhaps I have said enough for the present. I should like to have proposed the purchase of 50 tons of rough limestone, to construct a mound like those on which the *Saxifrages* are grown at Kew, so that a few hundred hardy dwarf alpine plants might be added to our collection; but this might be thought asking for too much at once. *C. Wolley Dod*.

— Mr. Dyer's note (p. 536), though no doubt unintentionally, and written with a different object, hardly, I think, does justice to the work carried on in Chiswick Garden. I entirely agree with what he writes about the great viney, and the astonishing, successfully cultivated collection of *Tomatos*. There is the additional interest attached to this last that it is grown in the old orchard-house, built out of the

surplus from the first country show held at Bury St. Edmunds, where Mr. Fish helped so well; but my proclivities rather take me to the herbaceous border, and to the long ranges of frames containing plants for distribution by ballot to the Fellows, and alpine and other hardy plants which Mr. Barron grows so well. My Wisley garden has many interesting plants which came from these frames, and I hope that they have received an equivalent from it. I also owe to them and to Mr. Barron the lesson how to grow successfully one of the prettiest of the early flowering *Saxifrages* (*S. Burseriana*). The judging flowers, fruit and vegetables, grown for comparison, has been for a long time valuable work, one or two instances in past days have fixed themselves in my memory owing to not very pleasant attendant circumstances. One was where the Fruit Committee, of which I was then a member, had on a very hot day, in a long Vine-house with a very high temperature, to taste and judge *Muscats*, with the result, if I remember rightly, of reducing the number of names from above thirty to about six. On another occasion we had to taste above a hundred sorts of Lancashire Gooseberries. I was one of those who held out to the end, but could not bear the sight of a Gooseberry for some time afterwards! Another trial, that of Peas, I mention that I may answer a question which has often been put to me, what I have to do with G. F. Wilson Pea? After the committee had selected this as one of the finest before them Messrs. Carter's (the grower's) representative asked if he might name it after the chairman? Of course I was happy to have so pleasant an association. This is all I had to do with the Pea. Some of the trials of annuals have been very good. When I visit Chiswick the impression on my mind is how much a little more money to spend, would improve matters. As to cost of labour for the work done, this is a matter in which I have had some experience, and have often wondered how Mr. Barron could get on as well as he did with the money allowed him, I believe the explanation of this to be, that his happy disposition attaches young men to him, so that he gets a good deal of active willing service without payment. Of course we are all agreed that the garden should as speedily as possible be shaped to meet the altered circumstances, and that the being clear of South Kensington requirements, will give more power for purely horticultural work. I do not fear that Chiswick will be "made a department of Kew;" these, with so great a garden on their shoulders, are not likely to wish to have the work and responsibility of another. When comparing any part of the work of the two gardens it should be remembered that one has a good Government grant and that the other has lived in a state of chronic poverty; for, even in days when a good deal of money came in from South Kensington, most of it went back again in some form or other. Though not thinking Chiswick a suitable place for the "fortnightly" shows, I have, in common with many others, a great attachment to it, from remembering it in the days of its glory, and its great exhibitions when there were no great shows to be seen elsewhere—when the Duke of Devonshire's grounds were opened to the visitors, and when my old friend Mr. Rucker used to compete with Mrs. Lawrence for the great Orchid Medal, though even this memory is not wholly pleasant. I mention this, as it shows the class and number of the visitors. Turnham Green used to be covered with waiting carriages, and as a boy I had to hunt out ours and to go under the horses heads, which was unpleasant. *George F. Wilson*.

— I have read with great interest all that has been said lately in the *Gardeners' Chronicle* about the future policy of the Royal Horticultural Society, and especially in respect to the development of the resources of Chiswick; and consider that the horticultural community is very much indebted to you for your advocacy of a reasonable line of procedure for the Society, and for a practicable application of the valuable resources which the Society commands in the Chiswick Garden. I am strongly in favour of making Chiswick the general place of meeting; in

fact, the "home of the Society," and, of course, of the "fortnightly meetings." I notice in the *Gardeners' Chronicle* for Saturday last that you think there should still be a divided "home," if I may so call it, with all the consequent expense attending it, for which there may be satisfactory reasons; although, in my ignorance of details, I am not aware of them. I notice your reference to the excellent accommodation for the Lindley Library and the ordinary business of the Council in the present offices in Victoria Street; and as they have been so recently acquired, and are found to suit the purpose so well, that undoubtedly forms a strong argument in favour of allowing them to remain where they are, at least for a time; but I may point out that a very little outlay would convert the office at Chiswick into a capital Council-room, and a small addition to the building would furnish all the needful accommodation for the whole management of the Society. The exhibits could be displayed to great advantage in the conservatory, or when it was not available, in one of the other large glass-houses: or, failing them, in a tent erected on the lawn adjoining the Council-room. Indeed, few places of the kind have so many facilities for accommodating a show of fruit, plants, flowers, or vegetables, either big or small. In respect to the locality, I am not aware of a better in or near London, and most certainly there is not one so generally popular among horticulturalists. To all of us outside of London it is quite as accessible and as easily found as the present offices in Westminster and the Drill Hall, while there is nothing to attract us at Westminster at all comparable to what Chiswick offers, and the near chance of getting a sight of Kew, not to mention the notable private gardens, market gardens, and nurseries with which the locality is so thickly strewn. Mr. Dyer's article gives a fairly good sketch of what we should like to see done at Chiswick, but of course entirely free from all Kew interference. *X.* [See also letter on p. 577. Ed.]

## FRUIT-FARMING.

READ Gladstone's advice about fruit-farming, jam, Cherries, Apples, and all the rest of it, with great interest. Why do the poor congregate in big towns, instead of doing this sort of thing in the country? So improvident! Believe there's a fortune to be made out of growing fruit and vegetables for London market, and mean to try.

Have bought a small farm. Nice light soil. Owner (who seems very anxious to get away), describes it as a "pebbly loam." More pebbles than loam, apparently. "Scratch your loam, and you find pebbles." Owner shows me orchard, paddock, cart-shed, &c., and induces me to take over his live and dead stock at valuation.

Settle at farm. Twenty miles out of town. Nearest rail  $2\frac{1}{2}$  miles; cartage to railway costs more than I expected. Have to pay gardener, too; pay *him* more (I fancy) than either of us expected. Buy some books on fruit-farming, and feel rather proud of my position. Shall talk (to friends who don't know much about me), of "my place in the country." Hope they won't come down and find me hoeing Mangel Wurzels.

Rather disappointed with perusal of the books. Find Apples don't like a "pebbly loam." Also only a few kinds of Apples have any sale nowadays. Call in a horticultural expert, and ask him to inspect my orchard.

Expert comes. Condemns orchard root and branch. Says, "only thing to be done is to grub up these 'ere trees, and plant noo ones." Well, then, what advantage do I get out of the old trees? "None whatever," he replies; "might just as well have bought a bit of meadow." Depressed. I think of riddle—"What's the good of Acres when you can't get a Bob out of them?" Riddle depresses me still further.

Give up Apples. Plant no end of Cherries and Gooseberries. Gardener says, "important for fruit to go off directly it's ripe." Mine goes off before it's

ripe. Goes off altogether; boys steal it. Also plant Cabbages and Mushrooms. Gardener says, "A fine opening for Mushrooms." Spend a month or two buying spawn, making beds, &c. What a lot of attention Mushrooms do want! Call this "small culture," indeed! Find that the opening for Mushrooms has closed when I come to sell them. Buyers offer a price which just about covers cost of carriage to town. I ask why? They explain that "public fancy has changed; Mushrooms not in vogue—Tomatoes are."

Try Tomatoes. Try 'em out-of-doors, and get 'em nipped by frost. Try again under glass. Putting up glass very expensive. Gardener suggests Grapes. After buying one or two choice varieties, find gardener doesn't understand planting them! Buy book on Grape-culture. While book coming, put Grapes-plants in cellar. Cellar doesn't suit them, it seems. Finally, when book arrives, plants have to be thrown away. Result of first year's fruit-growing—loss of £300. Not making fortune yet.

"Can small farms be made to answer?" somebody wants to know. Yes, if you don't mind the answer being "No."

This year try Asparagus in corner of large field. Very successful. Think of making a "corner" in Asparagus in London vegetable market. Gardener falls in with idea, and we keep crop back for a time. Consequence is, when we offer it nobody wants to buy! Have to eat most of it myself. Get perfectly sick of Asparagus in a week. Sick of gardener too. Dismiss him. He tells me, as he's going, that "them Petaters has the disease awful bad, and there ain't a Cherry on the trees because of caterpillars." Winds up by saying, "There's a bill coming in for 'them Sparregrasse beds,'"

There is, indeed. Such a bill! Seems that nothing will grow on the "pebbly loam," but that first one has to "make" the soil, and afterwards grow things. Always thought farms had good soil to begin with. What's the good of the Creation, if the ground has to be made all over again?

Losses increasing. As last desperate resource try jam. Erect small jam factory. Have one or two fields of Strawberries. Find a man who says he understands all about jam-making. "Get equal quantities of jam and sugar, and boil 'em up together," he says. It sounds very simple. Sugar bill enormous. When jam made, it really does look and taste very nice indeed. Send it to London. Letter in a few days from agent to say he can't sell my jam at any price. Too pure. Public like it with more "flavour" in it. And this comes of making real home-made jam. What a fool the public must be! Sell my farm at fearful sacrifice, and live in a "flat"—rather a suitable residence. Turn Tory. Understand now why poor congregate in large towns. Wonder if *they've* all been fruit-farmers like me, and made as much out of it? *Punch*.

## TREES AND SHRUBS.

### YELLOW-BERRIED YEW.

At Clontarf Castle, near Dublin, the seat of J. E. V. Vernon, Esq., D.L., there is, amongst many other rare trees and shrubs, a fine specimen of yellow-berryed English Yew, which in this neighbourhood is unique as to its golden berries. The tree is about 50 feet high, with laterals on the grass between 30 and 40 feet in length. At present the whole tree is densely covered with yellow fruit. Its beauty can easily be imagined, especially in contrast with many other varieties near it with red berries. The only difference observable in this specimen from the common English Yew is a somewhat denser growth and a lighter green colour. I have never seen or heard of a yellow-berryed Yew anywhere else in Ireland, but do not know whether it is also unique in England. *W. Watson, Clontarf Nursery, Dublin*. [The yellow-berryed yew originated, according to London, about 1817, near Dublin. The Clontarf tree above mentioned is also described by London, Arboretum, p. 2068. Ed.]

## MAXILLARIA FUSCATA.

Nor a new, but a very rare and quaint, species, is here depicted, whose likeness most orchidists will here see for the first time. The flower from which the illustration (fig. 81) was taken was from a plant which recently flowered in the collection of Sir Trevor Lawrence, Bart., which is as famous for handsome and curious things not found elsewhere. In habit and appearance *M. fuscata* resembles a small-growing *M. grandiflora*, and its flowers are numerous produced, and in the same manner. The form of the sepals is peculiar, they being curled inwards, and partly concave at the base especially the upper one, all three being milk-white at the base, the outer portion yellow, marked with chestnut-red. The petals are white outside, and yellow within, and have also a few reddish spots, so also the curiously formed labellum. Apart from its botanical interest, it is a sufficiently showy garden plant.

## VEGETABLES.

### NEAL'S NE PLUS ULTRA RUNNER BEAN.

This is a great improvement on the old Runner—in fact, upon any other variety which I have grown or seen. Last year I gave it a fair trial against the old variety, and for productiveness the *Ne Plus Ultra* is far ahead of it, producing more pods, which are straighter, longer, and more fleshy. The *Ne Plus Ultra* is a strong grower, and the plants commence to form pods much nearer to the ground than other varieties, and the flavour and colour when cooked are all that one could desire.

This new variety will, no doubt, soon become a great market favourite, the pods, in addition to being larger and of a very fleshy nature, have not such a tendency to curl round at the ends when fully grown, and they are quite devoid of the ruddy tint, which is a drawback with the old variety. Mr. Neal, the raiser, must be congratulated upon the result of his careful selection for a number of years before introducing it into commerce, and Mr. Deverill, seedsman, Banbury (of great Union notoriety), is lucky to have had the first opportunity of distributing such an acquisition. *G. H. Richards*.

## HOME CORRESPONDENCE.

 Correspondents will greatly oblige by sending early intelligence of local events likely to be of interest to our readers, or of any matters which it is desirable to bring under the notice of horticulturists.

Photographs or drawings of gardens, or of remarkable plants, trees, &c., are also solicited.

THE NATIONAL CARNATION SOCIETY.—I very much regret to observe that the executive of the National Carnation Society even proposes to take its annual shows to the Crystal Palace. No doubt the hope of getting from the Palace authorities some donation to the Society's small income is tempting, but one fails to see what connection there is between that vast place of amusement and the Carnation. I had hoped having reference to my recent advocacy of an outdoor trial of border Carnations at Chiswick; that the National Society, the assumed patron of Carnation culture in this country, would have readily supported such a proposal, and have gone a little farther and asked the sanction of the Council to hold its annual show of florists' flowers in a tent at Chiswick. The show of the pot-grown flowers in the one case and the trial of border varieties out in the garden conjointly would then have proved mutually helpful, and doubly attractive to lovers of a beautiful hardy flower. It cannot be said that the Crystal Palace is more accessible than is Chiswick. That would be an absurd suggestion. The Crystal Palace is created to furnish shareholders with dividends—the Royal Horticultural Society to promote and

foster horticulture. As to which should receive the encouragement of allied societies in such case it is not difficult to determine. *A. D.*

RHYNCHOSPERMUM (TRACHELEOSPERMUM) JASMINOIDES VARIEGATUM.—This is one of the best variegated greenhouse climbers we have, and it is very suitable to cover pillars and trellises in the conservatory. It is a plant which can be easily limited to a small space, or extended to cover a large one. I have a plant here which was planted nine years ago between two windows in the conservatory, where it now has a pleasing effect with its three coloured leaves and shoots, which keep the same colour the whole year round. It is an easily-managed plant when planted in light loam and peat; and cuttings root freely if put in sandy peat in heat. *Wm. Smyth, Basing Park, Alton*.

DIANTHUS SEGUIERI.—The Dianthus sent here-with is one of the best autumn flowers I know. I found it three years ago on the lower slopes of the hills by Riva on the Lago di Garda. It appears to me to be *Dianthus Segueri* var. *collinus*, of Koch's *Taschenbuch der Deutschen u. Schweizer Flora* = *D. collinus*, W. K. It is certainly well worthy of cultivation, being showy, hardy, and indifferent to smoke, as shown by the way it flourishes on a sandstone rockery in my garden here. *Alfred O. Walker*. [The plant is correctly named as to the species. We prefer not to give an opinion as to varieties of this kind. It is an excellent border plant. *Ed.*]

THE POTATO DISEASE.—Mr. Murphy's facts in relation to the effects of the Potato disease in Ireland shows farther, if proof were needed, that there is nothing new under the sun. He thinks the saviour of our Potato crops henceforth is to be found in early ripening sorts. The same thing was said years ago; but then such is the erratic nature of the disease visitation, that early ripeners are sometimes the chief sufferers, as this year for instance, all first and second early ripeners in the South of England were by far the worst diseased, whilst the robust late ripeners were the least injured. That fine late Potato, Abundance, diseased with Mr. Murphy 60 per cent., is with me absolutely free from disease. *Magnum Bonum*, Chancellor, Governor and some seedlings, also, were absolutely clean; Prime Minister, Schoolmaster, and a few other strong growers, nearly so; coloured Potatoes, are in the majority of cases here, the greatest sufferers, but why it would be difficult to say. The inference drawn by Mr. Murphy from certain results in field land, that soil which has recently considerably grown Potatoes, and, as he advances, has become full of the fungus spores, is hardly supported by facts. My worst disease this year was found in ground trenched last winter, which had carried flowers for three years previously, and was, in my opinion, due solely to the heavy dressing of raw manure applied in the spring. Crops of some kinds in ground which has carried Potatoes two years in succession previously, were, of sorts above named, quite free from disease, but these had no raw manure added. The remedy for the disease is more likely to be found in deep culture with an abnegation of raw manures, and the planting of sorts of known robust growth. All the same, adverse seasons tell us from time to time that no absolute rule can be devised which shall effectually cope with disease attacks. *A. D.*

BEGONIA CLARKEI.—*Appropos* of Mr. Wynne's capital Begonia book, reviewed in your last issue, the history of B. Clarkei and B. cinnabarina may be of interest, as it is rather a curious one. Two unknown tubers were one day given to me by my old ally in such things, James Carter, at his shop in Holborn. They had been sent to him by a friend in Bolivia. The said tubers grew and prospered. The first to flower was cinnabarina, which I gave in the following year to Mr. Arthur Henderson, who exhibited it with success. The next year I presented 1 to the Royal Horticultural Society a hundred seedling tubers of it. These were distributed, but the plant was difficult to grow, and soon went out of cultivation. Seeds were sent

home about the same time by Bridges, but I do not think any plants were reared from them. B. Clarke flowered the following year. I showed it to various gardening friends, but it did not attract much notice, being leggy in habit, and rather delicate; the flowers, however, had an exquisite fragrance. Subsequently I gave almost my last plant to Mr. Harry Veitch, who made some use of it in hybridising. In the same year Sir Joseph Hooker, to whom I showed it, figured and named it after myself. *R. T. Clarke.*

**LILY DISEASE.**—I have always appreciated the neat drawings of interesting fungi which Mr. Worthington G. Smith produces in such large numbers; but it was with considerable surprise that I saw the figure on p. 184 of the *Gardeners' Chronicle*, and read the remarks on the disease of Lilies which was there regarded as due to the presence of a *Peronospora*. I was surprised, in the first place, because I have had an enormous quantity of material of this Lily disease through my hands during the last three years, and have devoted much attention to it, this year especially, that it seems incredible that I should have missed a *Peronospora* had there been one present. In the second place, because the symptoms of the disease, so far as described by Mr. W. G. Smith, are just those due to the fungus I have been investigating; and when I mention that I have made more than a hundred cultures of the fungus under all kinds of conditions, besides examining some hundreds of preparations, it will be allowed that I have some claim to a hearing when I state my conviction, that the fungus in question is distinctly and positively not a *Peronospora* at all. Thirdly, because Mr. W. G. Smith's figure referred to, and the original drawing of *Ovularia elliptica* enable me to be still more definitely certain that the Lily disease is the same in all the cases, and that the (on other grounds extremely improbable) view that there are two very similar Lily diseases rife this year cannot be maintained. Moreover, the neat drawing of Mr. W. G. Smith itself bears witness to its not being a *Peronospora*—a point which, together with the paragraph about spores that "produce a convolute mass of mycelium as at b, which, on the opening of the spore, protrudes as a germinal thread;" and the sentence, "On coming to rest the zoospores in turn open and produce a germinal thread," I leave to the judgment of mycologists. No one is better aware than Mr. W. G. Smith that fungi are difficult things to deal with at sight, and it is one of the most lamentable of facts that so-called species are being introduced almost every week on crude and incomplete evidence, in just that department of botany where the greatest care is needed in getting at the truth. *H. Marshall Ward.*

**PURPLE PINK LORD LYON OR PLATO.**—At p. 474, in your issue of October 27, 1888, "R. D." alludes to this fine variety of early flowering and useful forcing Pink, and too much can hardly be said in its favour, so that Mr. Douglas was quite correct in pronouncing it to be the best purple Pink in cultivation. As stated by "R. D." it was raised by the late Mr. James Clarke, of Bury St. Edmunds, who was in his day a very successful amateur cultivator, as well as the raiser of many fine varieties of the Pink and other florists' flowers, including the well known Derby Day and many others. It may not, however, be known to "R. D., Mr. Douglas, and other admirers of this fine variety, that it, or, at least, one so like it in all respects that no one could perceive any difference, existed in Bury St. Edmunds years before Mr. Clarke raised from seed the variety sent out under the name of Lord Lyon. This variety in question was raised by Mr. Roland Dalton, an eminent surgeon in Bury St. Edmunds, as well as a very successful amateur florist, and the raiser of many fine varieties of the Pink, Carnation, and other florists' flowers, including his Isabella Dalton, a remarkably fine yellow Picotee, and many others, and these, with the Pink in question, which he named Plato, he generously distributed among his flower-loving friends. There is not the least doubt of Mr. Clarke having raised from seed the variety sent out under the name of Lord Lyon, and this, we believe, was done before he knew of the existence of Dalton's Plato or of the identity of the two. The writer of this had plants given him by Mr. Clarke of his Pink named Lord Lyon, and also plants of Plato given to him by Mr. Dalton, and grew them for years side by side, but could never perceive in them the slightest difference in flower, foliage, or habit of growth. Mr. Dalton is still alive, and although far advanced in years, still takes a lively interest in horticulture, and particularly in

florists' flowers, and could, no doubt, corroborate what has just been said regarding his favourite Pink, Plato, which was never, we believe, sent out by any member of the trade. *P. G.*

**CERTIFICATED APPLES AT CHISWICK.**—The list of Apples certificated at the recent Conference at Chiswick, whilst very interesting and valuable, must also be regarded in relation to the time any variety named in it has been in commerce. Several sorts, for instance, would hardly be exhibited by other than nurserymen, and where such get, in relation to the number of dishes shown, a good record, it may reasonably be inferred that the kind is even of greater merit than the limited number of certificates granted it indicates. Blenheim Orange, without doubt a grand Apple, and represented by no less than 170 dishes, comes out none the less so indifferently this season as to obtain only three certificates; while that splendid kind, Tyler's Kernel, out only some four or five years, and of which only a few dishes were staged, obtained as many certificates. Bismarck, again, out only about two years, gets two certificates, whilst the popular King of the Pippins, with sixty-nine dishes, gets one certificate only. Lady Sudely and Mrs. Barron, both quite new, get

FIG. 81.—*MAXILLARIA FUSCATA*: YELLOW WITH RED SPOTS.

two certificates; so also do such fine kinds as Lord Derby and Lord Grosvenor, whilst Salmarsch's Queen, Grenadier, and Potts' Seedling relatively stand well with certificates also. It may thus be inferred that, in regard to newer Apples, we are improving in appearance. Without doubt there was a desire to deal with particularly good dishes liberally in the matter of certificates, but some would have received a much larger number had the season been more favourable to the development of form and colour in the fruits. That so many fine samples of various kinds, old and new, were produced under such adverse climatic conditions as the recent season presented must be regarded at once as the dominant feature of the show of Apples, and a triumph of British hardy fruit culture. If the Conference be repeated in some five years' time, after a really favourable season, without doubt many of the more recently introduced Apples will figure largely, but no two of the number will, I think, take higher rank than will Bismarck and Tyler's Kernel. *A. D.*

**WALNUTS OF 1888.**—I find that very few of the Walnuts of the present season, grown in this neighbourhood, are of any value. The fruit from many of the trees contains no kernel, but merely an empty skin; while that from other trees contains a soft kernel with an insipid taste, and enclosed in a blue fungoid-looking skin. How far is this general?

Perhaps other readers will state their experience. *J. J. Willis, Harpenden.*

**CHISWICK** (see also p. 574).—Mr. Dyer's admirable letter in your columns last week, coming, as it does, from one occupying so distinguished a position, and from one who is also a prominent member of the Council of the Royal Horticultural Society, commands the earnest attention of all horticulturists. It is the natural corollary of your recent articles upon Chiswick, and the Council may eventually push the garden at Chiswick into prominence and usefulness. It may seem, perhaps, somewhat hypercritical to find fault with an expression, or even a term, but knowing something of the "touchiness" of the gardening community, and the sentiment of jealousy which exists, lest Chiswick should become ultimately a branch of Kew and be under Kew control, I can but regret that Mr. Dyer should have alluded to Chiswick as a horticultural Kew. That Mr. Dyer felt something the same as I do, seems evident by his closing sentence, in which he strives to define what he really means by the term, and it is exactly of the nature all reading his previous observations intelligently would arrive at. What Kew is to botany, or rather is in relation to practical educational botany, let Chiswick be made in relation to horticulture. We cannot hope that it will ever become as that is—a Government establishment, and probably it is best that it never should be so, as in such case it might fail to meet the requirements of active or progressive horticulture. Apart from the term thus taken exception to, there seems to be nothing in Mr. Dyer's letter which will not meet with universal approval. The stumbling block to progress now that sheer indifference to Chiswick no longer exists, is the financial position. The Society wants money, and in view of the nobility of the object aimed at, assuming that Mr. Dyer's proposals be accepted by the Council, it does seem as if a special Chiswick fund might be raised with considerable success. Before any appeal is made to the country, however, a scheme of an exact and practical nature, not too ambitious, but still very clear and decided in character, should be prepared and published; and with such a programme it does seem that a ready response would result. Of course, it is evident that under the proposed change Chiswick could hardly be the market garden that it now is, and must of necessity submit to a large deduction from its present income as derived from the sale of marketable produce. It is to the shame of horticulture such should be the case, but Chiswick in doing so is in good company. It is very obvious that nothing but a strong determination to make Chiswick a living and practical horticultural reality, will serve to resuscitate the Royal Horticultural Society, or to place it on that elevation which it is so desirable it should occupy. If Chiswick fails to attract support it is hard to tell through what other force it is to be secured. For that reason proposals to reorganise Chiswick, should be bold and of a thoroughly practical, yet liberal nature. Possibly the large surrounding population might be made to help in the revival, and it is to be hoped that horticulturists universally would be only too ready to help the old Society to accomplish so much good work at the old home. *Spade.*

**MINA LOBATA.**—Referring to the remarks at p. 542 of your last issue, as to the hardness of this beautiful climber, we may mention, that during the month of August we saw it growing magnificently, the plant literally covering a large piece of trellis with its pretty orange and red blossoms. The situation was quite an exposed one in the open air, near the Hartz Mountains, in Germany; we are, therefore, of the opinion that the plant will prove hardy in every part of England. *James Carter & Co.*

**THE TRIDESCIANTIAS.**—Permit me to put in a plea on behalf of this group of hardy perennials. They are hardy, distinct in character, and remarkably handsome, continuing in flower from May until September, and doing well in any good garden soil. The type is *T. virginica*, a native of South America, producing deep violet-blue flowers, with anthers of golden-yellow. Very fine clumps of this are to be found in cottage gardens, where, being left alone, they flourish and bloom amazingly. Of the varieties there are alba major, with handsome pure white single flowers; the double purple, azurea, rich deep blue, one of the very finest, and a double form of this also; rubra, deep bright carmine, very effective and showy; a double form of this, and another named delicata, soft blush-pink. This makes

eight varieties,—a very good selection indeed. Under the name of *T. subspersa*, shot-purple, is one well worth cultivating. I have seen bunches of cut flowers of *Tradescantias*, and especially of the rich deep blue variety used in stands of bunches of cut flowers of hardy perennials; the blue, white, and carmine afford an excellent contrast. At the great Whitson show at Manchester, where collections of hardy flowers are shown in pots, the *Tradescantias* play an important part. As a matter of course, nearly all of them have to be forced into flower, but the *Tradescantias* bear forcing well. As they grow to a height of from 12 to 18 inches, they should occupy about the third row in the heraceous border; but ample room should be given them, as in suitable soil they make large tufts when they are well-established. As the *Tradescantias* do not appear to seed, the sole mode of propagation is by means of division of the roots. *R. D.*

**WALL TREE BORDERS.**—There is no rule without its exception, but in the case of wall tree borders the rule is to plant the borders perpetually with vegetables or flowers, and the exception is to find the border left unoccupied. That wall trees do not suffer appreciably under such double cropping of the borders is evident from the fact that almost universally good vegetable crops are taken off the borders, which are annually dug and manured up to within 3 feet of the tree stems, and yet trees do well and produce abundant crops of fruit. There seems to be no doubt whatever that wall trees, especially the tenderer of stone-fruits, suffer far more from climatic conditions and sudden changes of temperature than from defective cultivation of fruit borders. The fact is that gardeners cannot afford, even if they would, to dispense with cropping of their wall tree borders. These, and especially the warmer ones, are invaluable for the growth of early vegetables; indeed, are indispensable. It is just possible that borders of, say, from 10 to 12 feet in width, if not thus surface moulded and cropped, would, if left constantly hard or mulched, soon become close and sour and inimical to root development (Vine borders do not become so). I know very well that at Ditton Park, Slough, with its 400 yards length of 10 feet wall, and double that length of cultivated border, the walls carrying superb trees of all ordinary kinds, and presenting, on the whole, one of the best examples of wall tree culture in the kingdom, all the borders up to within 3 feet of the trees are close cropped. Perhaps the chief secret of success there lies in the fact that prior to planting new trees, a foot depth of rubble and rough turf was always placed well below; and thus the roots were kept out of the sub-soil, and induced to run deep in the well-manured soil beneath the vegetable crop. *A. D.*

## SOCIETIES.

### LINNEAN.

THE first meeting of the session 1888–89 took place on Thursday evening, November 1, Mr. William Carruthers, F.R.S., President, in the chair. The following were elected Fellows of the Society:—William Overend Priestley, M.D., F.R.C.P.; John Way, M.D.; and John Evans, Esq.

Professor Bower exhibited and made remarks upon some adventitious buds on a leaf of *Gnetum gnemon*.

Mr. John Young exhibited (1) a rare bird, *Ptarmicus sociabilis*, unobserved for fifty years, and lately rediscovered by him in Patagonia; (2) a cluster of nests formed of lichen (*Usnea*) by a swift, as supposed of the genus *Collocalia*, from a cave in Eimes, one of the Society Islands; (3) remarkably elongated tail feathers of domestic cock (11 feet in length) artificially produced by the Japanese; (4), nest and eggs of the snow bunting (*Plectrophenax nivalis*) taken during the past summer in Scotland.

Mr. Thomas Christy exhibited a new method of transmitting light to a microscope by means of a curved rod of glass.

The Rev. R. Baron read a paper on the "Flora of Madagascar," in which he gave an interesting account of his explorations and collections in that island. In a second paper entitled, "Further Contributions to the Flora of Madagascar," Mr. J. G. Baker, F.R.S., described the principal novelties brought home by Mr. Baron, and paid a well deserved tribute to his energy and ability as a botanical explorer. The next meeting of the Society will be held on November 15.

## ROYAL HORTICULTURAL.

TUESDAY, November 13.—At this meeting of the above Society there was but a small assemblage of garden productions, apart from a trade group of Cyclamens in bloom, the interest centering in the various business mentioned elsewhere.

### Floral Committee.

Present: G. F. Wilson, Esq., in the chair; and Messrs. Rev. W. Wilks, J. O'Brien, J. Laing, J. Walker, G. Duffell, H. Herbst, B. Wynne, C. Noble, C. Pilcher, J. Dornay, H. Ballantine, H. M. Pollett.

From the Royal Gardens, Kew, came a small but beautiful collection of *Nymphaea* blooms, viz., *N. lotus devoniensis*, bright pink; *N. l. pubescens*, very light rose, anthers orange-coloured; *N. lotus*, Linn., white and yellow; *N. kewensis* x, of the colour of *N. l. devoniensis*, but with more breadth in the petal; and lastly, *N. Orgiensiensis*, flowers of light pink, with anthers of an orange hue.

Mr. H. Ballantine, Baron Schroder's gardener, exhibited *Lælia Victoria* (*L. crispata* x *L. Dominyi*). The petals and sepals are purplish-rose, lip dark purple—this colour running down into the lower end of the throat where it is margined with a yellow suffusion. The spike was twin flowered. Some beautiful flowers of warm-house *Rhododendrons* were shown by Messrs. J. Veitch & Sons, most of them being recent hybrids. We may mention a few of the best:—*Maiden's Blush*, pale flesh; *Duchess of Edinburgh*, scarlet; *Primrose*, the colour of its namesake; *Aurora*, salmon; *Empress*, crimson; *President*, orange; *Rose Perfection*, one of the choicest and with a large truss, too; *Princess Alexandra*, a pretty white; and *Princess Christian*, yellow.

Mr. W. Cummins, of The Grange, Wallington, showed *Disa graminifolia*, a slender-habited plant, with two flowers of a deep shade of blue.

From the garden of B. D. Knox, Esq., Cayersham Park, Reading (gr. Mr. Lawrence), came a small species of *Oncidium*, with a small compact spike of yellow and brown flowers, which individually measured half an inch across.

Mr. G. Stevens, nurseryman, Putney, showed Japanese *Chrysanthemum* Mr. Garner, an orange-coloured flower, with forests slightly twisted; and also the better-known *Avalanche*.

A Japanese *Chrysanthemum* named *Charles Delmas*, of a chestnut-brown colour, was shown by Messrs. J. R. Pearson, Chillwell, Notts.

Mr. W. Warren, of Norton Gardens, Isleworth, staged 240 *Cyclamens*, in good bloom—excellent market stuff.

From Dropmore came fine cones of *Pinus Lambertiana*.

### FIRST-CLASS CERTIFICATES.

*Chrysanthemum* Mr. Garner, from Mr. G. Stevens. *Chrysanthemum Avalanche*, from Mr. G. Stevens. *Lælia Victoria* x, from Baron Schroder.

### MEDALS.

*Silver Banksian*.—To Mr. W. Warren, for group of *Cyclamens*.

### Fruit Committee.

Present: H. J. Veitch, Esq., in the chair; and Messrs. P. Crowley, G. W. Cummins, R. D. Blackmore, J. Smith, W. Warren, S. Ford, A. Pearson, W. Marshall, J. Willard, J. Cheal, J. Roberts, and P. Barr.

Chiswick sent a collection of Beetroots, consisting of Egyptian, Pine-apple, Improved Black, Pragnell's, Nutting's Dwarf, and Veitch's Selected Red, Dewar's, Dell's Crimson and *Dracena*-leaved, all of these being from seeds obtained from Messrs. J. Veitch & Sons, Chelsea. Most of the roots appeared to be of good colour, and none was too large for ordinary use.

Ellecombe's *Victoria* and *Covent Garden Red* came from Messrs. Rutley & Silverlock, seedsmen, Victoria Embankment.

Dobbie & Sons' *New Purple* is a Beetroot of good colour and shape.

Chiswick likewise sent a large collection of Onions, amongst them being some few blood-red Onions which, in some instances, were raised from Messrs. Vilmorin & Co.'s seeds.

There was a remarkable similarity in shape and color amongst all of them, and the bulbs did not show to advantage when compared with the larger yellow and brown-skinned bulbs of more popular varieties of Onions. Southport red Globe (Veitch)

and Red Mezieres (Vilmorin) approached nearest to the perfection in form seen in the first-named. Thirty varieties or strains of varieties of light-skinned Onions were shown, a few being of French origin.

Mr. J. Willard, gr. to Lady Burdett Coutts-Bartlett, Holly Lodge, Highgate, exhibited some examples of the new vegetables mentioned in our columns recently.—*Asparagus Chicory*. By sowings made twice or thrice during late spring and summer a succession of edible flower-stalks can be obtained, the removal of the first stalk resulting in the formation of a number of others. It may be forced and blanched in the open by using a Skealope to cover it; but it would seem that some kind of ventilation is then necessary to preserve the plant from the effects of damp.

Messrs. J. Carter & Co., High Holborn, showed a boxful of tubers of *Stachys tubifera*; also some cooked tubers.

Mr. Tozer, Leamington, showed a seedling Potato, raised in 1887 from seed; it is a long, slender, white tuber.

W. Roupell, Esq., Streatham, showed sixty varieties of Apples and received a Bronze Banksian Medal. Some of the fruit was of remarkable goodness, notably Peasgood's Nonsuch Apple, Pitmaston, Duchesse, and Baitet Père Pears.

H. A. Lane, Esq., Mileham, Streatham, exhibited a small collection of Apples and Pears.

A seedling Grape, the produce of a cross of Gros Colmar with an unknown variety, was shown by E. H. Woodall, Esq., St. Michael's House, Scarborough. It is a large black fruit, with crisp flesh, and indifferent flavour.

### FIRST-CLASS CERTIFICATES.

*Stachys tubifera*, from Messrs. James Carter & Co. *Onion Southport Red Globe*, from Messrs. James Veitch & Son.

### MEDAL.

*Bronze Banksian*.—To Mr. W. Roupell, for collection of Apples.

## PORTSMOUTH CHRYSANTHEMUM SHOW.

NOVEMBER 7, 8, and 9.—The fourth annual exhibition of the Portsmouth Chrysanthemum Society was held as usual in the capacious Drill Hall, Landport. The entries were more numerous than on any former occasion, and the show itself was a great success.

*Cut Blooms*.—These were the most important part of the exhibition, as many as 1800 being staged in the various classes. The competition in the class for thirty-six incurved and Japanese was close, a handsome Challenge Trophy, valued at £25, and £6 in money, being the prizes for the best stand. Messrs. W. & G. Drover, Fareham, secured the 1st place rather easily, the incurved blooms being large, fresh, and well finished; the Japanese were of good quality, and were well put up. The more noticeable blooms were *E. Molyneux*, *Boale d'Or*, *M. J. M. Pigny*, *Fimbriatum*, *Madame Baco*, and *Avalanche* among Japanese varieties; the best incurved were *Lord Alcester*, the premier bloom in the show; *Golden Empress*, *Empress of India*, and *Mrs. Shipman*. 2nd, Mr. W. Neville, gr. to F. W. Flight, Esq., Twyford, Winchester, with a neat collection of smaller flowers; 3rd, Mr. Penfold, gr. to Sir F. Fitz Wygram, Leigh Park, Havant.

In the class for twenty-four incurved and Japanese varieties there were seven competitors. 1st, Mr. E. Molyneux, gr. to W. H. Myers, Esq., Swanmore Park, Bishop's Waltham, with blooms in his customary well-finished style, the varieties, however, containing no novelties; 2nd, Mr. G. Trinder, gr. to Sir Henry St. Mildmay, Bart., Dogmersfield Park, who staged well; *Boale d'Or* in this stand, taking honors as the premier Japanese bloom in the show.

For twelve Japanese blooms, distinct, 1st, Mr. Inglefield, gr. to Sir J. W. Keble, Tedworth, Marlborough, with massive clean bloom, *E. Molyneux* and *Ralph Brockbeak* being the best. Mr. E. Molyneux was a close 2nd.

For the same number of incurved varieties the last named exhibitor was 1st, with blooms of medium size, fresh, and well finished; 2nd, Messrs. Drover, whose blooms were marked by a slight want of freshness.

For twelve blooms each of Mrs. G. Rundle, Mrs. Dixon, and G. Glenny there were three competitors. The last-named exhibitors were 1st, with symmetrical and fresh blooms.

For the best twelve reflexed blooms, in not less than eight varieties, Mr. W. Woodhine, gr. to Captain Boyd, Emsworth, was 1st, the blooms being of medium size.

Messrs. Drover were easily victors in the large-flowered Anemone class against five others; the blooms were conspicuous by the fulness of their centres and their capital colour. The same firm had the best twelve Japanese Anemone blooms we have so far seen this season, notably Fabian de Mediana, Marjolaine, and Jeanne Marty.

Messrs. Neville and Russell's pompons were attractive for the quality and variety of the blooms shown.

A new class was formed for twelve bunches of fimbriated varieties, three blooms to a bunch. The exhibits of these made an attractive feature, especially the winning stand of Mr. Hatch's, Victoria Park. Chardonnet is a dark purple variety which showed to great advantage. Mr. Agate, Havant, was 2nd.

For growers on Portsea Island a Silver Cup was offered for twenty-four blooms in equal numbers of incurved, Japanese, reflexed, and Anemone varieties. The much coveted prize was taken by Mr. Hatch.

The best two blooms in separate classes were shown by Mr. E. Molyneux, who had fine examples of E. Molyneux and Empress of India.

The display made by the amateurs was extensive and the rivalry very keen.

**Plants.**—Eight specimens, one half to be Japanese and the other to be either incurved or reflexed at the option of the exhibitor.—Mr. W. Joy, nurseryman, Shirley, Southampton, was well to the front with very fine examples measuring 4 feet in diameter, neatly trained, and well flowered; 2nd, Mr. E. Wills, gr. to Mrs. Pearce, The Firs, Bassett, Southampton, with neat and smaller plants.

Twelve competed in the class for a group of Chrysanthemums arranged in a space of 50 square feet, and so very meritorious were the exhibits that six awards were made, the 1st going to Mr. N. Gate, gr. to G. Cook, Esq., Gosport, whose blooms were exceptionally fine, although the arrangement of the plants might have been improved on. Mr. Hatch was 2nd, with plants artistically arranged.

**Fruit.**—The exhibits under this head were, on the whole, creditable, and what was lacking in quantity was made up in quality. For six bunches of black and white Grapes Mr. E. Molyneux was easily 1st, with Alicante and Muscat of Alexandria. Mr. Penford, to whom was awarded the 2nd prize, depended upon Barbarossa and Muscat of Alexandria, and the latter variety was rather small in the bunch.

Mr. W. Tait, gr. to General Napier, Cosham, was 1st, for two bunches of black Grapes, the sort staged being Alicante, good both in bunch and colour.

Mr. Covell secured 1st honours for the same number of bunches of white Grapes.

A bunch of Trebbiano weighing 5 lb. 12 oz. secured the 1st prize for Mr. Molyneux in another class, and one of Black Alicante of 4 lb. in weight gained the 2nd prize for Mr. Smith, gr. to Mrs. Learmouth, Cosham.

Hardy fruits were well shown by Mr. J. Watkins, Wellington, Hereford; Mr. Jacob, Petworth; and Mr. Trinder.

The vegetables of Mr. J. Cox, gr. to R. K. Wyndham, Corhampton House, Bishop's Waltham; and those of some others were excellent.

## BATH CHRYSANTHEMUM SHOW.

NOVEMBER 7 AND 8.—The show—the fourth of the season—which the Bath Floral Fête Committee held in the Assembly Rooms on the above date, must be classed as one of the best Chrysanthemum shows held in Bath.

**Plants.**—The Veitch Memorial Medal and £5 in money, offered as 1st prize for eight plants, four Japanese and four large-flowered varieties (Anemone excluded) on one stem, was well won by R. B. Cater, Esq.; Rev. E. Handley was a good 2nd. In the class for six distinct varieties (Japanese and Anemones excluded), Mr. W. S. Tredwell was 1st. The flowers, the plants shown in this class were not fully developed. Mr. E. B. Titley had the best four plants of pompons pyramidally trained. Mr. R. B. Cater had the best specimen (Anemone excluded) showing a Mrs. G. Rundle, 7 feet high, in fine condition, but the flowers were hardly expanded. Dr. Budd was 2nd with the same variety. Mr. E. B. Titley had the best specimen Anemone, showing George Sander, Mr. T. Joly being 2nd with Fleur de Marie, which promised to be a splendid specimen a week hence. Mr. W. J. Brown was 1st for a flat-trained plant, showing a good plant of Mrs. G.

Rundle, 6 feet over; Mr. Cater being 2nd with the same variety. Mr. W. J. Brown was awarded a Silver Medal for the best Chrysanthemum plant in the show for a finely-flowered Mrs. G. Rundle.

**Groups.**—Mr. R. B. Cater had the best group of Chrysanthemum plants arranged for effect. Messrs. Cooling & Sons were a good 1st for a group of miscellaneous plants put up for effect. Mr. A. A. Walters had the best six table plants, as well as the best dozen Cyclamens, showing well in both classes. Mr. W. Pumphrey had the best six Bouvardias; and Mr. Cater had the best six plants of Orchids, staging good plants, including *Oncidium tigrinum* and *Odontoglossum Sanderianum*, with excellent spikes of flower.

**Cut Flowers.**—With twenty-four blooms, distinct varieties, (Anemones and Japanese excluded) Mr. John Aplin, gr. to Mrs. B. Baker, Hasfield Court, Gloucester, was 1st, being closely pressed by Mr. Ward, Longford Castle, and Mr. Horsfield, Heytesbury. Mr. Aplin's best blooms were Queen of England, Alfred Salter, Lord Wolsley, Lord Alcester, Golden Empress, Pink Venus, White Venus, and Mr. Bunn. Mr. Ward's best bloom was Empress of India, which won the Silver Medal given by the National Chrysanthemum Society for the best bloom in the show. Last year this medal was awarded to a bloom of Lord Alcester in the Longford stand. Mr. Horsfield was 1st, with twelve blooms of a like description to those staged in the preceding class with large solid blooms of the most popular varieties, Lord Wolsley and Golden Empress being especially good. Mr. Ward was a very close 2nd, and Mr. A. Cole a good 3rd. Six lots were put up. Major Clark and Dr. Budd were 1st and 2nd for stands of six blooms, showing well. With twenty-four blooms of Japanese, distinct, Mr. Lucas, gr. to Wilfred Marshall, Esq., Taunton, was 1st, Mr. Ward a good 2nd. Mr. Lucas' best blooms were Boule d'Or, a grand bloom with very long richly coloured florets; Baron de Prailly, Val d'Andorre, J. K. Pigny, Avalanche, W. Robinson, and Elaine. Mr. Ward's best blooms being Grandiora, E. Molyneux, Duchess of Albany, and Thunberg. With twelve blooms, Mr. Lucas was 1st, Mr. Aplin 2nd, both showing well. Mr. Ward had the best twelve blooms of large flowered Anemones, showing Fabian de Mediana, Madame Clos, Scur Dorothee Souille, &c.

**Miscellaneous.**—Primulas were shown well by Mr. W. S. Tredwell who was 1st, staging large well flowered plants. With six plants, any colour, single flower, Mr. J. Inwick was 1st, and Mr. Inwick was also 1st for four doubles. Mr. E. E. Bryant was 1st for six ornamental foliage plants, his best being Crotons.

**Fruit** was plentiful and of first-rate quality. Grapes being shown in fine condition and finish. Mr. Taylor, gr. to Mr. Alderman Chaffin, Bath, was 1st, for four bunches, showing two grand clusters of Muscat of Alexandria, weighing about 3 lb. each, well coloured but slightly shrivelled; Alicante and Lady Downe's, splendidly coloured. 2nd, Mr. J. Jones, showing two well coloured Gros Colmar, one fairly well coloured Alnwick Seedling, and one Lady Downe's.

For three bunches of black Grapes Mr. Pym, gr. to Mrs. Goldsmith, Trowbridge, was 1st, staging very large bunches of Gros Colmar, splendidly coloured; Mr. Jones being 2nd, with good examples of Black Alicante.

With three bunches of white Grapes, Mr. Taylor and Mr. Green, gr. to Earl Cowley, were 1st and 2nd, both showing Muscats.

Mr. Pratt, gr. to the Marquis of Bath, Longleat, was 1st for a collection of fruit, showing large well coloured bunches of Alicante and Muscat Grapes, Late Admirable Peaches, Coe's Golden Drop Plums, &c.

Messrs. Pragnell, Weaver, E. Hall, Pinder, Payne, and Aplin exhibited excellent examples of Pears and Apples; and the first-named gardener was very successful with vegetables.

## CRYSTAL PALACE.

NOVEMBER 9 AND 10.—This was the last Chrysanthemum show of the year at this place. The blooms were generally of good quality, and the competition close in some cases.

**Cut Blooms.**—In the large class for forty-eight cut blooms, twelve incurved and twelve Japanese, Messrs. W. & G. Drover, Fareham, led, with uniformly good blooms; the Japanese were of fine size too, but the incurved were not very large, but even and clean, the

most conspicuous blooms being Belle Poule, Ralph Brocklebank, E. Molyneux, Boule d'Or (deep colour), J. Delaux, Lord Alcester, Golden Empress, Barbara (fine), Prince Alfred, and Empress Eugenie. Mr. J. Horsfield, gr. to Lord Heytesbury, Heytesbury, Wilts, was 2nd, also with good blooms; Jeanne d'Arc was very fine here, and Barbara, Lord Alcester, Jardin des Plantes, Queen of England, Val d'Andorre, Carew Underwood, E. Molyneux, and Belle Poule. Messrs. W. Ray & Co., Sittingbourne, were 3rd, having Jardin des Plantes, Refulgens, Roi de Japonais, and Criterion as their finest.

Mr. M. Sullivan, gr. to D. B. Chapman, Esq., Downshire House, Roehampton, was the leader for eighteen incurved blooms, distinct, with rather small but fair samples, Mr. Bunn, J. Salter, Empress, and Jardin des Plantes were shown. 2nd, Mr. A. G. Hookings, gr. to Sir H. Thompson, West Moulsey, who followed closely, having Lord Alcester, Cherub, Empress of India, and Jardin des Plantes as his best.

There were fifteen entries of six blooms (one variety), Mr. J. Doughty, gr. to Mrs. Tomlin, Angley Park, Crabbrook, leading, with fine blooms of Golden Empress, of large size; and Mr. Hewett, gr. to H. Mackeson, Esq., Hythe, was a close 2nd, with Lord Alcester, in fine form.

The best eighteen Japanese were from Mr. W. Packman, gr. to C. E. Shea, Esq., The Elms, Foot's Cray, Kent, who had bright even blooms of fair size, embracing the usual most popular varieties; a very close 2nd was Mr. T. Glen, gr. to Mrs. Montifore, Worth Park, Crawley, with uniformly bright blooms slightly smaller than the foregoing. Messrs. W. & G. Drover were the most successful (out of fourteen competitors) in the class for six Japanese, one variety, with fine blooms of Boule d'Or, and Mr. Doughty with Belle Poule, very finely coloured, was 2nd. Messrs. Drover were also 1st in the three classes for reflexed, Anemone and Japanese Anemone blooms, showing well in each instance.

For twelve pompons and also for twelve pompon Anemones, Mr. Duncan, gr. to C. T. Lucas, Esq., Warnham Court, Horsham, was placed 1st with bright flowers of good size in both cases, and Mr. E. Chadwick, gr. to E. M. Nelson, Esq., Hanger Hill House, Woking, was similarly placed, leading easily, for twelve single varieties, staging a very pretty stand of blooms.

**Pot Plants.**—These were well shown on the whole, but the competition was not close. Messrs. Davis & Jones, Camberwell, had a neat group of well-flowered incurved varieties, in which class they were the only exhibitors, and the 1st place was justly accorded. For a group of Japanese flowered plants, Messrs. J. Laing & Sons, Forest Hill, S.E., led well with a number of large flowered plants, in which besides the popular varieties there was Mons. Bernard, a long petalled reflexed Jap., after the style of Madame de Sévén, but of deeper colour. Among other recent introductions Messrs. Davis & Jones were 2nd, with the ordinary varieties in smaller flowered specimens. The best group from an amateur was that of Mr. F. Ball, gr. to Sir H. Doulton, The Woodlands, Tooting Common, with tall grown plants bearing large, bright, and clean blooms—Lord Alcester, Empress, and Peter the Great being prominent. Mr. J. Gravett, gr. to Dr. Hetley, Upton Norwood, was a fair 2nd with several good Japanese specimens.

Six trained incurved plants were very good from Mr. E. Cherry, gr. to Mr. Gabriel, Norfolk House, Streatham, who had bush-trained plants, strong and well flowered, Golden Empress and Queen of England being the best, and the same exhibitor led again for six trained Japanese, and for six trained pompons, with low trained plants in both instances. Of the Japanese, L'île des Plaisirs, Lady Selbourne, and Cossack were the best; all, however, being strong, well-flowered, and healthy. Mr. W. Clarke, gr. to J. H. Lile, Esq., Devon House, Brixton Hill, was 2nd for Japanese with very fine plants of Margot and Source d'Or.

**Primulas.**—Mr. J. Rodbourn, gr. to Baroness Hath, Coombe House, Croydon, led for twelve Chinese Primulas red, and for the same number of doubles, having well-flowered plants. Mr. A. Carter, gr. to Alderman Evans, Ewell Grove, Ewell, Surrey, occupying the 1st place, for white Primulas, with the best lot of all, the plants bearing large flowers of good clean colour.

**Special Prices.**—These were offered by Messrs. Sutton & Sons, Reading; Messrs. J. Carter & Co., High Holborn, London; and by Mr. C. Fidler, Reading. Mr. W. H. Smith, Horpit Warborough, Shrivernham, took the leading prizes offered for Potatoes by Messrs. Sutton, with clean and sound

tubers; and Mr. Cherry and Mr. G. Goldsmith, grs. to Sir E. G. Loder, Bart., Flore, Weedon, were 2nd in different classes, the last-named leading for Onions with large bulbs but rather soft. Mr. Ridgewell, Histon Road, Cambridge, took both the 1st's offered by Mr. Fidler for Potatoes, showing sound healthy tubers.

**Non-competing Exhibits.**—A centre of attraction here was a large collection of Apples grown in Nova Scotia (Port William), and exhibited by Messrs. Nothard & Lowe, Toley Street, London. They were samples of fruit now arriving for sale in the English market, and were remarkable for their high colouring; the following were the leading varieties:—Gravenstein, Willoughby, Yellow Bellefleur, King Pippin, Blenheim Orange, Two Once Pippin, Emperor Alexander, Baldwin, Bailey's Golden, Ribston Pippin, Pennock, and Northern Spy.

An extensive collection of Potatoes was sent from Messrs. Sutton & Sons, embracing a large number of varieties, all well-grown and clean.

Mr. Fidler also sent a collection of Potatoes, and Messrs. Sutton, and also Messrs. Carter had *Stachys tubifera*.

Messrs. H. Cannell & Sons, Swanley, Kent, had Dahlias, Pelargoniums, and Begonias.

Apples were shown by Messrs. J. Laing & Sons, and by Messrs. J. Cheal & Sons, Crawley, both having clean and well-grown fruits. Messrs. Cheal also had Pears.

### HITCHIN CHRYSANTHEMUM.

Nov. 9.—This Society held its third annual exhibition of Chrysanthemums in the Corn Exchange on Nov. 9. There was a fair amount of entries; and perhaps the best lot of blooms that has ever been shown at Hitchin was on this occasion put up by Mr. R. Adams, gr. to G. B. Hodson, Esq., Frogmore Hall, Hertford. Mr. J. Kipling, gr. to the Earl of Lytton, Knebworth, also showed well.

For forty-eight incurred, 1st, Mr. Adams; 2nd, Mr. Kipling. For forty-eight Japanese, 1st, Mr. Adams; 2nd, Mr. Springham, gr. to J. H. Tuke, Esq., Hinton. For twenty-four Japanese, Mr. J. Anning, gr. to W. S. Brown, Esq., Digswell House, Welwyn, 1st; 2nd, Mr. Fowle, incurred, 1st, Mr. Jos. Upchurch, gr. to T. S. Lucas, Esq.; 2nd, Mr. Anning. For six trained specimens in pots, Mr. Springham was 1st, Mr. Upchurch 2nd. For three trained specimens, Mr. Millard, gr. to W. Ransome, Esq., was 1st. For twelve Japanese, Mr. E. Osman was 1st, and Mr. Sharp 2nd.

In the amateurs class, Mr. Wm. Abbiss was 1st, with three specimens; Mr. W. G. P. Clark, was 1st for nine incurred; Mr. E. Catton, 2nd. Mr. Wm. Abbiss was 1st for six incurred; Mr. A. E. Halsey, 2nd. Mr. G. P. Clark was 1st with nine Japanese; and Mr. W. Abbiss, 2nd.

**Groups.**—These were nicely arranged, and most of the plants were loaded with fine flowers.—1st, E. Mr. Osman; 2nd, Mr. W. Springham.

**Medals.**—Mr. Adams was awarded the Silver Medal for the best bloom in the show. There was some difference of opinion as to which should take it, the Japanese or the incurred; it was in the end given for a nice bloom Empress of India. Mr. Springham had a similar award for the best plant in the show; and for the best bloom in the amateurs class, Mr. W. G. P. Clark took the Bronze Medal for Golden Emperor. *A Correspondent.*

### TWICKENHAM HORTICULTURAL.

NOVEMBER 13.—Favoured with almost summer-like weather this show was held in the Twickenham Town Hall, on the above date. The entries showed some falling off, but the exhibits were excellent. Amongst material not for competition were an interesting collection of *Lycastes* and *Cypripediums*, backed by African Marigolds in pots, sent by Mr. Henry Little, which received high commendation. Mr. Bates, Poulett Lodge Gardens, had a fine *Cypripedium* insignine, some decorative plants, and a fine lot of blooms of Japanese and incurred Chrysanthemums, one flower of Maiden's Blush being half bluish and half rich yellow. Mr. Howard, Teddington, exhibited four fine plants of *Calanthe vesita*, carrying numerous spikes of bloom. Messrs. Hooper & Co., Twickenham, had a box of twenty-four bunches of *Gloxinia* flowers from late-sown seedlings, wonderfully rich in colour and marking—a very fine strain.

Mr. Fordham, a local florist, showed a group of

Chrysanthemums faced with foliage and flowering plants, and specially pleasing, a quantity of *Pernettyas* in pots, very fully berried.

Mr. Walker, of Whitton, and Mr. Warren, of Isleworth, both exhibited plants of their fine strains of *Cyclamen* in bloom. The latter showed fully a hundred plants in numerous colours.

Very remarkable as well as interesting were the fine collections of Apples and Pears, with vegetables, shown by Mr. Walter Mann and Mr. W. Poupert, market growers, of Twickenham. Mr. Mann had superb Market Red Celery, Cauliflowers, Beet, Tomatoes, &c., and many dishes of fruits. Mr. Poupert showed fifty dishes of Apples, all leading market kinds, and twenty-five sorts of Pears, as also some of his famous Celery.

In the competitive classes the 1st prize for an arranged group of plants, here neatly faced with Ferns, fell to Mr. J. Parsons, gr. to T. Twining, Esq., Twickenham, whose grouping was as excellent as his flowers were good. Mr. Street, gr. to Lady Freake, was 2nd, his plants having capital flowers, being too crowded, and Mr. Waldie, gr. to J. Bigwood, Esq., M.P., was 3rd. The best trained plants came from Mr. Fallows, gr. to the Misses Vaughan, who had Mrs. G. Rundle, George Glenn, Lord Wolseley, and L'le des Plaisirs. Scarlet Pelargoniums, Chinese Primroses, and *Cyclamen* were moderate in quality.

Table plants were excellent, the best six coming from Mr. Parsons. Mr. Filsell was placed 1st, with a table-stand of flowers, but Mr. W. Brown's seemed to be the more elegant. A very charming stand of berries and hardy foliage from Miss Redstep, St. Margarets, took 1st place in its class.

The chief places in the cut flower competitions were taken by Mr. Coombs, gr. to W. Farze, Esq., Teddington, who was in form with incurred flowers, and Mr. Munro, gr. to J. D. Paul, Esq., Twickenham, who was equally strong in Japanese. Mr. Coombs was 1st, and Mr. Munro 2nd, with twenty-four flowers, half incurred, and half Japanese. Mr. Coombs also came 1st with twelve fine incurred flowers, Mr. Davis being 2nd; and Mr. Coombs also took 1st place in the class for six incurred, one variety with purple flowers of Queen of England, Mr. Munro coming 2nd with White Empress. Mr. Munro was 1st for twelve Japanese, in two classes, all beautiful flowers; and also had the best six of one variety in grand flowers of Boule d'Or.

Of fruits, Mr. Street had the best Grapes in Alicante. Mr. Hardham, fruiterer, showed grand Gros Colman, but not for competition. Mr. Smith, Whitton Park Gardens, had the best four dishes of Apples; Mr. Fitzwater, gr. to H. Labouchere, Esq., M.P., being 2nd—all capital samples. Mr. Davis was 1st for four dishes of Pears, with Mr. Garrod, gr. to J. R. Tindall, Esq., 2nd.

The best collection of vegetables, really capital samples, came from the Metropolitan Police Orphanage, Mr. Stroud, Superintendent, being the exhibitor.

### MOLESEY CHRYSANTHEMUM SHOW.

THE annual exhibition under the auspices of the East and West Molesey and Hampton Court Chrysanthemum Society was held at the Conservative Hall, Walton Road, East Molesey, on Tuesday and Wednesday, Nov. 13 and 14. The finest group of Chrysanthemums was shown by Mr. Hookings, gr. to Sir H. Thompson, while Mr. Peters, gr. to A. Keeling, Esq., was next best. In the class for smaller groups Mr. Brazier, gr. to H. Jenkins, Esq., came off 1st; Mr. A. Masters, gr. to R. E. Bap, Esq., 2nd; and Mr. Larrant, gr. to Mrs. Gilliot, 3rd. The class for twenty-four blooms, distinct, (twelve incurred and twelve Japanese) produced keen competition. Mr. Hookings was again successful, Mr. Turner, gr. to F. Francis, Esq., taking 2nd place. The former collection included fine specimens of Maiden's Blush, Japonais, Ralph Brockelbank, Golden Empress of India, and Prince of Wales. Mr. Turner's two dozen had among them commendable specimens.

Mr. Hookings was also the winner of the 1st prizes in the class for the best six incurred blooms of one variety, and that for Japanese ditto. Empress of India was the winner of the first-mentioned; and of the Japanese, Madame C. Audiguier.

The amateur and cottager's classes produced some interesting exhibits; and some fine fruit was shown, Messrs. Turner, Gower, Brazier, and Hayes being to the fore in the latter department.

Several local gardeners lent plants, &c., not for competition.

### BRIGHTON AND HOVE CHRYSANTHEMUM.

NOVEMBER 13 AND 14.—The above exhibition was, without doubt, the best the Society has ever brought together, the flowers and plants being of great merit, and strong competition ruled throughout.

**Cut Blooms.**—In the highest class, that for forty-eight, half to be Japanese, and half incurred, W. & G. Drover, florists, Fareham, were 1st—Edwin Molyneux, A. Valance, being amongst the fine Japanese varieties shown; whilst the incurred contained the usual fine varieties. This was a good all-round exhibit, with scarcely a weak bloom in it. Mr. Hopkins, gr. to Robert Thornton, Esq., High Cross, Framfield, was 2nd, his best blooms being Thunberg, Carew Underwood, and Belle Etoile; and John Salter, Bronze Queen, and Golden Empress in incurves. There were eight competitors.

For twenty-four incurred, the last-named exhibitor was 1st, with even blooms, John Salter being again in fine condition; 2nd, Mr. M. Russell, gr. to Dr. Lewis, Henfield. The same number competed as in the former class.

Twenty-four, Japanese.—1st, Messrs. Drover, with another extra fine lot of blooms; the 2nd prize going to Mr. F. Glen, gr. to Mrs. Montefiore, Worth Park, Crawley, for an exhibit scarcely inferior. There were seven entries.

For twelve incurred, 1st, Mr. Fowler, gr. to Mrs. Hall, Henfield, with very even flowers. Nine competed. The same exhibitor was also the winner for twelve Japanese with another extra strong lot. Thunberg was very fine—Mr. Jupp, gr. to G. Boulton, Esq., Torfield, Eastbourne; and Mr. Snow, South Park, Wadish, taking two respective 2nd prizes.

For six incurred, Mr. Hall was again 1st, and for a similar number of Japanese Mr. Snow was 1st, his Duchess of Albany and Edwin Molyneux being extra fine.

Messrs. Drover took another 1st for six reflexed blooms in the best known varieties.

Mr. Glen won the 1st for six Japanese, any variety, with grandly developed blooms of Mlle. Lacroix. Mr. A. W. Fieldwick, an amateur grower, also showed well in this class.

For twelve pompons Mr. Russell was a strong 1st, with remarkably fine blooms in trusses of three each. With an excellent bouquet Mr. Miller, Southdown Nursery, Shoreham, stood 1st, with an arrangement devoid of formality. Mr. Geere, Hurstpierpoint, was a good 2nd. There were thirteen entries.

For table decorations in Chrysanthemums, Mr. Kent was 1st, and Mr. Spottiswood, gr. to Mrs. Duddell, Queen's Park, Brighton, 2nd.

The several classes provided for amateur growers brought forth many examples, scarcely inferior to those shown by professional gardeners.

**Plants.**—For four dwarfs, 1st, Mr. Meachen, gr. to Mrs. Wickham, Withdeane, with a well-grown lot in abundant bloom, the best being Source d'Or and Bouquet Fait; 2nd, Mr. Hill, gr. to M. Wallis, Esq., Withdeane, who had a fine plant of Princess of Wales.

Mr. Hill was 1st for a fine set of four standards; Roseum superbum, Mrs. Dixon, and Peter the Great were extra good. 2nd, Mr. Scutt, gr. to G. T. Jenkins, Esq., Burgess Hill, for four that were very freely flowered, but scarcely good enough in quality.

Mr. Meachen again won with four capital pyramids, and Mr. Hill for a single specimen of the same.

With groups there was also a strong competition. In the larger class (100 square feet), arranged in a semi-circle, Mr. Bunney, gr. to W. Campion, Esq., Danny Park, Hurst, came off victorious, with an effective group, composed of plants that displayed the best of culture—Source d'Or, Mlle. Lacroix, Val d'Andorre, and Mrs. Geo. Rundle were here used to the best advantage; Mr. Taylor, gr. to Major W. Wick Hall, Hove, following, with a capital exhibit of the best decorative kinds, including, besides those already mentioned, good plants of Callingsfordii.

In the smaller class of groups (60 feet), Mr. G. House, gr. to F. Mowatt, Esq., Withdeane Hall, was 1st, and staged many plants therein with extra fine blooms; 2nd, Mr. W. Collins, gr. to R. Clowes, Esq., Hassocks, with a group containing an abundant display of bloom.

Pompons in six varieties were shown in good order and abundantly bloomed by Mr. Godby, gr. to Dr. Moore, Burgess Hill; and Mr. Bunney was again 1st, this time for twelve plants in 6 inch pots with excellent examples of decorative plants.

Primulas, single and double, were shown in large

numbers. For the former Mr. Wickham, gr. to J. Humphrey, Esq., Keymer, was 1st, with twelve whites in capital order.

For double kinds, Mr. Tullett, foreman at the West Brighton Nurseries (Mr. W. Miles), was placed 1st, with twelve grandly flowered plants; Mr. Bunney being a good 2nd.

For twelve Cyclamens, Mr. Tullett was an easy winner, with very floriferous examples of the best strains. Mr. Meachen secured a 1st for six pots of Mignonette among several good exhibits.

With six table plants, Mr. Snow gained the 1st award, with plants of medium size; Mr. Turner being 2nd, with very light examples.

**Fruit: Grapes.**—Muscat of Alexandria was shown in fine condition by Mr. Goldsmith, gr. to Mrs. C. A. Hoare, Kelsey Manor, Beckenham; being followed by Mr. Spottiswood, with larger bunches, but not quite so well up in colour.

Black Grapes were best represented by Black Alicante, the 1st award going to Mr. Buxton, gr. to J. Butler, Esq., Withdrane; Mr. George Miles, Victoria Nursery, following him closely. Some well-kept Black Hamburgs were shown by Mr. Godby.

Mr. Goldsmith was 1st with four dishes of Pears, showing fine examples of Pitmaston Duchess, Duchesse d'Angoulême, Durocheau, and Beurré Dié; Mr. Cornwall, gr. to F. G. Courthouse, Esq., Lewes, being a good 2nd.

With dessert Apples, Mr. Goldsmith was 1st, showing standard varieties, in good form. Messrs. Goldsmith, Duncan, and Bunney showed good fruit.

**Vegetables.**—These were shown in large numbers, and of first-rate quality, the 1st prize winners being Mr. W. May, gr. to G. Neame, Esq., Littlehampton, who was strong in roots; and by Mr. Goldsmith, who had a good all-round collection in the class for Messrs. Sutton & Sons' prizes; in the latter class Mr. Spottiswood staged a capital lot, and secured the 2nd prize.

**Miscellaneous Exhibits** were shown in good numbers, the chief of which were a group of large decorative plants, in which some finely grown Tree Ferns were most conspicuous. These were finished off with small flowering and foliage plants, and formed the central point of decoration in the dome on the orchestral platform, and came from the West Brighton Nurseries, being arranged by Mr. Longhurst.

Messrs. Balchin, of Cliftonville and Hassocks, had groups of finely-grown Ericas, foliage plants, and some forty or more dishes of the best varieties of Apples of Sussex growth.

Messrs. Cheal & Son also showed from their Crawley Nurseries between eighty and ninety dishes of Apples and Pears of the best kinds.

Some fine Grapes and a huge cross in white Chrysanthemums came from Mr. W. Miles; the cross being arranged on black velvet, produced a splendid effect.

The Colonies were represented by many fine dishes of Apples, remarkable for their colour; these were exhibited by Mr. Starr, of Port William, Nova Scotia.

### DEVIZES CHRYSANTHEMUM.

NOVEMBER 13.—This took place as usual in the Corn Exchange, in connection with the annual bazaar in aid of the Benevolent Society, the exhibits being as usual admirably arranged by Mr. T. King, of Devizes Castle Gardens. The exhibition has to be kept within certain bounds, but the plants were very fine indeed, and the cut flowers, both incurved and Japanese, highly finished.

**Plants.**—The best four specimens, grandly grown and flowered, came from Mr. Hale, gr. to C. N. May, Esq., The Elms, Devizes, the varieties Empress of India, Mrs. Dixon, G. Glenny, and Lord Alcester; 2nd, Mr. Clark, gr. to C. E. Colston, Esq., Roundway Park, Devizes, his best specimens being Barbara and Mrs. G. Rundle. Mr. May was also 1st with a plant each of Mrs. G. Rundle, Mrs. Dixon, and G. Glenny, superbly grown and bloomed. Mr. Colston being 2nd. With four specimens of Japanese varieties Mr. May was again 1st, having admirable grown and flowered specimens of Blanche Fleurie, Bouquet Fait, Soleil Levant, and Madame Bertha Rendatler. 2nd, Mr. Colston, his two best specimens being Madame Sévin and Madame Bertha Rendatler. Mr. May had the best four specimen Pompons; the varieties being Mdle. Marthe, Golden Mdle. Marthe, Scour Melaine, and Black Douglas. 2nd, Mr. Colston.

**Cut Blooms.**—There were six collections of twenty-

four blooms of incurved varieties in eighteen varieties, and here Messrs. W. and G. Drover, nurserymen, Fareham, were placed 1st, having large and finely finished flowers of Lord Alcester, Alfred Salter, Empress of India, Queen of England, Golden Queen, Lord Wolsley, Jeanne d'Arc, Princess of Wales, Nil Desperandum, and Mr. W. Shipman. 2nd, Mr. J. Horsefield, gr. to Lord Heytesbury, Wiltshire, who also had some excellent blooms, his best flowers being Empress of India, Jeanne d'Arc, Golden Empress, Queen of England, Bronze Queen, Mrs. W. Shipman, Mrs. Heale, Jardin des Plantes, and Alfred Salter.

The best twelve varieties, distinct, came from Mr. W. Thomas, gr. to Wilfrid Marshall, Esq., Taunton, a very good lot, the leading varieties Golden Queen, Jeanne d'Arc, Baron Beust, Lord Wolsley, &c.; 2nd, Mr. G. Ingleford, gr. to Sir J. W. Kelk, Bt., Tedworth, Wilts.

Mr. May had the best twelve shown with 4 inches of stem and foliage, having excellent examples, some of the varieties already named, including Mr. Bunn. There was no other exhibitor in this class.

Mr. May also exhibited the twelve best Anemone-flowered varieties, not less than four varieties, showing good blooms of Lady Margaret, Fabian de Mediana, Sœur Dorothee Souille, Gluck, and Mrs. Pethers.

The cut blooms of Japanese varieties were numerous and very fine. Messrs. W. & G. Drover were again 1st, with finely finished blooms of Marguerite Marrouch, Glorioso, Belle Paule, Jean Delaux, Edwin Molyneux, Ralph Brocklebank, Aylanche, &c.; 2nd, Mr. G. Inglefield.

Mr. May also had the best twelve reflexed varieties, showing some very fine blooms of Amy Ruzé, Chevalier Domage, King of Crismons, Cullingfordi, Mr. Forsyth, and Dr. Sharpe; 2nd, Mr. W. Allen, The Gardens, Shallowfield Park, Reading.

Baskets of hardy autumn foliage, including berries, were a charming feature, a goodly number of baskets being prettily arranged. The best came from Mr. Thomas Lewis, Devizes; Messrs. K. J. Medlicott, Devizes, being 2nd.

Primulas, both single and double-flowered, formed a pleasing exhibition of themselves, but space forbids our mentioning the names of the exhibitors of these.

### THE BRITISH FRUIT GROWERS' ASSOCIATION.

A MEETING of the above Association was held in the Royal Aquarium, on Thursday last, November 8, to discuss the subject of railway rates in relation to fruit transit. Mr. T. F. Rivers took the chair at 5 P.M. In the course of a few introductory remarks the Chairman congratulated the Association on the encouraging success which has attended its formation.

Mr. Rivers, he said, succeeded in drawing public attention to the necessity of thoroughly examining the possible outcome of the decrease of industrial fruit-growing in this country, and I hope of arresting the serious loss which would undoubtedly occur if measures were not taken to arrest such loss before the evil had gone too far to mend. It is proposed in the ensuing year to hold meetings in the provincial districts to invite the co-operation of all who are willing to help us in the good work by reading papers and assembling to discuss matters which are of vital importance to this particular industry. We intend to deal with matters of important interest in a thoroughly impartial spirit. One of the important points is the cost of the conveyance of fruit, and we shall be glad if we can, by obtaining information, enable growers, handicapped by distance from the centres of distribution, to compete with those more happily situated. We trust that we shall be able to obtain by reports from competent persons sufficient knowledge on this head to submit our case to the Board of Trade. There are good grounds for believing that the cost of the transport of fruit is much greater than it need be, and that this cost presses heavily on one of our native industries. I must remind those who make the reports that the facts must be accurate, and that a case which is to be submitted to the Board of Trade must be very clear and distinct.

We also hope by inquiry and discussion to raise the standard of quality of fruits sent to market, and as planting is likely to be carried on for some years on a more extensive scale than has hitherto been known, any information as to the relative value of sorts in different districts will be of very great importance to the planter, and it will, I hope, be one of the aims and objects of the Society to classify

and determine as far as possible the suitability of sorts of fruits to different localities; the fewer sorts the better, both for the fruit tree grower and the planter. It is, I think, known to many that a very decided liking is exhibited by certain fruits to particular districts. I may instance the Winesap Plum in Yorkshire, the Apple orchards of Herefordshire and Devonshire, the Bullaces of East Anglia, and in my own district the singular success of the Early Prolific Plum. A society which can visit the different fruit-growing districts will be able to gather more facts than a society which is fixed permanently in any one locality, and will, I imagine, much extend its sphere of usefulness.

Mr. Watkins of Hereford remarked in a letter that the present rates are amongst the greatest hindrances to the extension of fruit-cultivation. Mr. J. Udale, Tamworth, wrote—"Railway rates for the transit of fruit and vegetables under some circumstances are quite prohibitive. Twelve months ago I was in the habit of sending all classes of fruit to two fruiterers in Birmingham. Choice fruit was sent by passenger train, coarse fruit and vegetables by goods train, thinking it would be much cheaper. However, after our consignments had been delivered at the ordinary goods rate, I received notice from my customer that the railway company had a higher tariff for fruit and vegetables, and that they demanded extra payment of either 1s. 3d. or 1s. 6d. on previous payments for the same weight of the same class of goods in the same hamper. This additional charge, in conjunction with the rate upon returned empties, caused me to cease sending such goods to Birmingham, and I dispose of them nearer home. This excessive charge by the railway company causes a direct loss to four classes of the community:—1st, the grower; 2nd, the railway companies themselves; 3rd, the fruiterer; 4th, the public. My experience is, that the railway rates are prohibitive of the rapid transport and wider distribution of all classes of garden produce except fruit and flowers of the highest quality, beyond a distance of twenty miles; and I have long been of opinion that the time had come when it was desirable that growers should combine for the purposes of dealing with railway rates, selecting the most suitable markets, and disposing of their own produce, if possible, direct to the consumer."

From Mr. W. E. Bear a suggestive letter was received in which he said—"It seems to me that the only really important thing for your Association to do in this connection, is to form a Parliamentary Committee, and to get the Association recognised as a body entitled to be represented before the Board of Trade. All members who have real grievances should send details to the Committee, and those that prove on examination to be valid should be brought before the Board of Trade. It is no use to read a paper showing that rates on fruit are too high; everybody knows that. The time has come to get such rates reduced."

Mr. Albert Bath said he had made some careful comparisons between the rates per ton for fruit conveyed by rail from different stations at an equal distance from London, and he showed, by a series of figures, the extraordinary disproportion that existed on some lines. He contended that a system of equalisation was needed in the interest of growers who had to send their fruit long distances.

Mr. R. Dean followed with some facts and figures relating to the irregularities of railway charges, showing how the foreign preferential rates press very heavily on the home producer, the difference in a railway rate often meaning the whole of the profit. It was stated that English Potatoes and fruit cost 23s. 4d. per ton to bring from Selling (near Faversham) to London, yet foreign produce of the same character were brought to London *via* Selling for 20s. per ton.

Mr. Figures of the Railway Clearing Office, remarked that the railway companies were mostly willing to make any reasonable concessions, and that there was a danger if rates were much decreased it would have a tendency to flood some markets, with a consequent reduction in prices to the producers. He thought the best plan was to encourage people to send their goods to the nearest markets. The business of the meeting was concluded by a resolution, to the effect "that the Executive Committee of the British Fruit Growers' Association be requested to collect all available information on the subject of railway rates in fruit transit and distribution, to enter into communication for this object with the Railway and Canal Traders' Association, and to submit the results in the form of a report at the earliest convenient meeting."

## THE WEATHER.

[Accumulated temperature indicates the combined amount and duration of the excess or defect of temperature above or below 32° F. for the period named, and is expressed in Day-degrees—a "Day-degree" signifying 1° continued for twenty-four hours, or any other number of degrees for an inversely proportional number of hours.]

## THE PAST WEEK.

The following summary record of the weather for the week ending Nov. 12, is furnished from the Meteorological Office:—

"The weather has continued very cloudy or dull in almost all parts of the kingdom. In the extreme north of Scotland, however, it has been fair, with scarcely any rain, but in most parts of England and Ireland very heavy rain fell during the latter part of the period, and the conditions were rough and squally generally.

"The temperature has been rather above the mean over Ireland, Scotland, the 'Channel Islands,' and 'England, S.W.," but a little below it over the greater part of England. The highest of the maxima, which were registered in most places on the 12th, ranged from 51° in 'Scotland, E.' to 58° in 'England, S.W.," and the 'Channel Islands.' During the earlier days of the period the daily

maxima were low over central and 'England, S.E.," the highest readings on the 7th varying between 36° and 38°. The lowest of the minima were generally recorded either on the 7th or 8th, when they ranged from 30° in 'England, N.W.," to 34° in 'England, N.E.," 'Scotland, W.," and 'Ireland, N.," to 37° in 'Ireland, S.," and to 42° in the 'Channel Islands.'

"The rainfall has been much less than the mean in 'Scotland, N.," and rather less in 'England, E.," but in nearly all other districts a very considerable excess is shown. Over central and south-western England, the fall has been more than twice as much as the average value. At Culhampton the fall during the 8th amounted to 2.29 inches.

"Bright sunshine has again been very little prevalent excepting in 'Scotland, N.," The percentage of the possible amount of duration ranged from 5 to 24 over the kingdom generally, but in 'Scotland, N.," it was 35."

## SEEDS.

LONDON: Nov. 14.—Messrs. John Shaw & Sons, seed merchants, of 37, Mark Lane, E.C., report that the market thin, attended with scarcely any business doing: With regard to Clover-seeds a not

unhealthy lull has taken place; the recent speculative fever having for the time abated. American red Clover seed shows a substantial reduction from the highest point. There is no quotable variation in either Alsike, white, or Trefoil. For bird seed the sale is slow. Fine large blue Peas are inquired for; prices keep firm. In Haricot Beans the tendency continues upwards. Linsed is dearer.

## CORN.

Averages.—Official statement showing the average price of British corn, imperial measure, in the week ended November 10:—Wheat, 31s. 8d.; Barley, 28s. 2d.; Oats, 16s. 2d. For the corresponding week in 1887:—Wheat, 31s. 5d.; Barley, 28s. 6d.; Oats, 15s. 5d.

## FRUIT AND VEGETABLES.

SPIITALFIELDS: Nov. 14.—There were abundant supplies to-day, and the trade dull, causing prices to rule low. Potato trade fair for best samples, but for inferior sorts. Quotations:—Peas, 2s. 6d. to 3s. 6d. per bushel; English Apples, 3s. to 5s. do.; do., 1s. 6d. to 2s. 6d. per half-bushel; American do., 9s. to 18s. per barrel; Cauliflowers, 2s. to 5s. per tally; Savoyis, 1s. to 3s. do.; Cabbages, 1s. 3d. to 2s. do.; Brussels Sprouts, 1s. to 1s. 6d. per half-sieve; Greens, 1s. to 1s. 3d. per dozen bunches; Turnips, 1s. 6d. to 2s. do.; Carrots, 1s. 3d. to 1s. 9d. do.; Parsley, 1s. 6d. to 2s. do.; Horseradish, 10d. to 1s. 2d. per bundle; Celery, 4s. to 12s. per dozen bundles; English Onions, 4s. to 10s. 6d. per cwt.; Dutch Onions, 2s. 6d. to 3s. per bag; Belgian Onions, 2s. 3d. to 2s. 9d. do.; pickling Onions, 4s. to 5s. do.; Endive, 1s. 6d. to 2s. per dozen; Cos Lettuce, 4d. to 8d. per score of 22; Carrots, 20s. to 30s. per ton.

STRAITFORD, Nov. 13.—Both trade and supply have been good during the past week. Cabbages, 2s. to 2s. 6d. per tally; Savoyis, 3s. to 3s. 6d. do.; Greens, 1s. 3d. to 1s. 6d. dozen; Turnips, 30s. to 40s. ton; Carrots, household, 35s. to 40s. do.; Mangels, 14s. to 21s. do.; Swedes, 16s. to 22s. do.; Onions, Dutch, 2s. 6d. to 3s. 6d. per bag; Watercress, 6d. per doz.; Apples, 2s. 9d. to 6s. per bushel; Pears, 2s. 6d. to 4s. do.; Chestnuts, 7s. to 10s. per bag; Walnuts, 3s. 9d. to 4s. 9d. do.; Sprouts, 2s. to 2s. 6d. per half-sieve; Celery, 10d. to 1s. per roll.

## POTATOES.

BOROUGH AND SPIITALFIELDS: Nov. 13.—Supplies on offer are in moderate compass, and a steady trade is passing. Best samples tend rather dearer.—Regents, Scotch, 80s. to 100s.; English, 60s. to 100s.; Hebrons, 60s. to 110s.; Magnum Bonums, 60s. to 100s. per ton.

SPIITALFIELDS: Nov. 14.—Quotations:—Beauty of Hebron, 80s. to 100s.; Magnums, 65s. to 90s.; Imperators, 80s. to 90s.; Champions, 55s. to 70s.; Regents, 60s. to 90s. per ton.

STRAITFORD: Nov. 13.—Quotations:—Beauty of Hebron, 60s. to 80s.; White Elephants, 70s. to 90s.; Light-land Magnums, 65s. to 85s.; dark-land do., 60s. to 70s. per ton.

Imports.—The following are the imports into London during the past week:—9479 bags from Hamburg, 210 bags from Bremen, 11 bags from Amsterdam, 20 packages from Flushing, and 110 sacks from Stettin.

## HAY.

Averages.—The following are the averages of the prices obtained at the various metropolitan markets during the past week:—Clover, prime, old, 120s. to 150s.; new, 80s. to 110s.; inferior, 45s. to 84s.; prime meadow hay, 120s. to 130s.; good new hay, 80s. to 100s.; old straw, 42s. to 48s.; new, 30s. to 44s. per load.

## NOTICES TO CORRESPONDENTS.

ADIANTUM HYBRID: W. H. H. It is a very robust plant, and may have a value in certain positions.

BOOKS: Student. Apply to Messrs. W. Rider & Son, 14, Bartholomew Close, E.C.

CATTLEYA MOSSIE: C. E. H. We cannot explain the reason that your plants have two leaves springing from the pseudobulb. It must be an improvement in appearance, and you should not look for a

remedy for the redundancy. Moreover, there is none.

**CORRECTIONS.**—In our report of the National Chrysanthemum Society, in our last issue, p. 547 (miscellaneous Exhibits), for G. Bunyard & Co., read, T. Bunyard, Asford, had a collection of Apples; and on the same page in the twelve Japanese blooms, Metropolitan class, for Buck read Beech.

**FRUIT FOR PROFIT.** *G. C. W.* We cannot, in these pages, afford you the special information you seek, but refer you to the recent numbers of the *Gardeners' Chronicle* dealing with this matter, viz., the issues for October 6, 13, 20 and 27.

**GRAPES.** *P. D. W.* They appear to have been rubbed severely with the hand, or to have been syringed heavily continuously. Red-spider will damage Grapes sometimes by consuming the bloom on the berries.

**"LUFFTENTLICHESLEDE."** *Dr. L.* We are quite unable to surmise what is meant. There is, probably, some error in transcription.

**MISTARD AND CRESS.** *T. Smith.* See our "Kitchen Garden" calendar in this issue.

**NAMES OF FRUIT.** *D. E.* 1, local Cider Apple; 2, Blenheim Orange.—*W. P.* 1, rotten; 2, Beurré Capiaumont; 3 and 4, not recognised; 5, Ribston Pippin; 6, Warner's King.—*M. J. D.* 1, Hawthorn; 2, Fearn's Pippin; 3, not recognised; 4, Cox's Orange Pippin.—*W. N.* 1, Grange's Pearmain; 2, unknown; 3, Scarlet Nonpareil; 4, Wadhurst Pippin; 5, Golden Reinette; 6, Royal Russet.—*G. S.* Apples: 1, Peasgood's Nonsuch; others unknown.—*S. D.* 1, Marie Louise d'Ucle; 2, Beurré Gris; 3, Thompson's; 4, Emile d'Heyst; 5, Beurré Bosc; 6, unknown.—*J. T. Pear.* King Edward.—*S. Pope.* 1, Wadhurst Pippin; 2, Warner's King; 3, Hambleton Deux Ans.—*W. W.* 1, Beurré Capiaumont; 2, Passe Colmar.

**NAMES OF PLANTS.** *P. D. W.* Embotrium coccineum; Athrotaxis laxifolia; Thunia gigantea.—*F. S. M.* Single flower, Odontoglossum tripudians; the other is Oncidium pretextum.—*H. G. E.* Crinum Mooreanum.—*J. Fisher.* 1, Epidendrum sp., cannot determine without flower; 2, Brassavola Digbyana. Your other question next week.—*J. B. Way.* 1, Eria pubescens; 2, Catasetum fuliginosum; 3, Cattleya Dowiana aurea.—*G. Martin.* 1, Goodyera sp.: send a leaf with flower, otherwise we cannot determine the species; 2, Phalenopsis Esmeralda; 3, Odontoglossum grande (fine flower).—*T. Gell.* Matricaria multiflora (South Africa).—*F. H. 3.* Erica propendens (a rare plant); 4, E. spumosa.—*P. H. Gosse.* Polylaga chamebuxus.—*Constant Reader.* The Oak is one of the innumerable seedling forms of the common Evergreen Oak.—*A. C. H.* Both *Picea Morinda*.—*J. H.* Cybiumidum Lowianum.—*South Devon.* 1, Thuopsis nutkaensis (borealis); 2, Juniperus recurva; 3, Cupressus, next week; 4, Laminium purpureum, golden-leaved variety; 5, Geranium sanguineum.—*E. M.* Pleione, next week.

**PERVERSION OF FRENCH NAMES.** *E. P. W.* It is not fair to expect an ordinary gardener to be a French scholar, and we do not think your proposed scheme would do anything to lessen the torturings of which you complain. As you are going to try the effect of inducing your gardener to pronounce Dupuis Jamin as "Dupwee Jam-mang," and Gloire de Dijon as "Glowore de Dejon," and so forth, you will soon be enabled to judge for yourself how your proposed plan will work; but we are quite certain no Frenchman would recognise French as you propose it should be spoken in English gardens, any better than according to present arrangements.

**PLANTING SANDBILLS.** *A. D. W.* The MS. is mislaid, and if found it shall be returned to you.

**POULTRY.** *W. Chiffy.* The articles you would supply do not come within the scope of the paper.

**SOLANUMS.** *G. H.* We suppose you mean the ordinary berried species, which is easily raised from seed or cuttings. Young plants raised from either may be planted out in moderately good ground in the full sunshine, or they may be kept in pots, giving only slight shifts as they seem to require them. Let the pots stand on a bed of coal-ashes, or plunge them in the same to the rim. The essentials are—syringing to keep down red-spider, careful watering, and not permitting them to suffer from dryness at the root, which is fatal to leaf and bloom. The drainage of the pot should be efficient,

and the compost, sandy loam and leaf-mould. After August is out, the plants in the open ground should be potted, and all of them be put into frames, so as to be quite under control. From November onwards treat them as greenhouse plants, and some, even a little warmer, if the berries are wanted to colour early. They require in the winter months plenty of light and ventilation, but not draughts of cold air.

**THE HEAVIEST BUNCH OF GRAPES.** *F. H. F.* On September 16, 1875, at Glasgow show, Mr. Carron showed a bunch of Trebbiano of 26 lb. 4 oz. in weight.

**TOMATO CULTURE.** *A. N. I. W.* There is no book which treats of this subject, nor is there any need of one. Any book on gardening matters treats the subject explicitly enough.

**VINES.** *E. M.* They are not, as you suppose, affected with Phylloxera, but seem to have suffered at the root from some deleterious substance, or from excessive heat at the root. Your note gives no clue as to cause, and we cannot assist you further.

### CATALOGUES RECEIVED.

**LITTLE & BALLANTYNE,** Carlisle—Trees and Shrubs, **WILLIAM EATHERINGTON,** The Gardens, Swanscombe, Kent—Chrysanthemums.

*Correspondents sending plants or fruits to be named, or asking questions demanding time and research for their solution, must not expect to obtain an answer to their enquiries in the current week.*

**THE CORK INDUSTRY IN SPAIN.**—The British consul at Barcelona, in a report just published, states that during the past year there has been much improvement in the cork industry, because there has been an extraordinary demand for the superior kinds of corks for champagne. The export of corks to England, the Continent, and the United States, has been greater than in former years. Gerona is the most important centre of the cork industry in Spain, and an idea of the magnitude of the manufacture may be gathered from the following figures:—In 1885 the export of cork in pieces amounted to 15,883 cwt., while the number of corks exported was 1,137,217,000, representing a total value of about £600,000. In 1886 this increased to 19,635 cwt. of pieces, 16,357 squares, and 1,194,902,000 corks, of a total value of £710,000. The corks are made with diminutive machines of the simplest kind. Hundreds of factories are scattered over the province of Gerona, the town of Palamos alone having fifty. In some places the Cork trees have been suffering from the invasion of a pest which threatened to destroy them. A voracious caterpillar, or worm, appeared by millions in the Cork forests, and in a very short time stripped the trees of all the leaves from the tips of the branches to the trunks. These worms are now in their turn attacked and devoured by another insect, a species of beetle of a dark green colour, and armed with a horn with which it cuts the worms up. Another insect in the form of a crab (*xangro*) pursues the worms and destroys them. Moreover, when the caterpillar has passed through its metamorphosis, and the butterflies have deposited their eggs, another insect, until now unknown, attacks and pierces the bags containing the new germs, and destroys them. It is hoped that by means of these three agencies the complete extinction of the destructive caterpillars may be accomplished.

## GARDEN REQUISITES.

**Quality, THE BEST in the Market.** (All sacks included.)  
PEAT, best brown fibrous ... 5s. per sack for 22½ bush.  
PEAT, best black fibrous ... 4s. 6d. ... 5 sacks for 20s.  
PEAT, extra selected Orchard ... 7s. 6d. ... 5 sacks for 35s.  
LOAM, PREPARED COMPOST 1½ per bush, 3s. per sack  
LEAF, or PEAT MOULD ... 1½ (sacks included).  
SILVER SAND, coarse, 1s. 6d. per bush, 14s. half-ton, 24s. ton.  
RAFFIA FIBRE, best only ... 1s. per lb.  
TOBACCO CLOTH, or PAPER ... 1s. lb.; 2½, 27s.  
SPHAGNUM MOSS, all selected, 3s. per bush, 5s. per sack.  
CHUBB'S "PERFECT" FER-  
TILIZER (the Best Food for  
all kinds of Plants, Flowers,  
Fruits, Vegetables, &c.) ... 1½ 3/8 5/8 14½ 16½ 17½ 19½ 21½ 22½ 24½ 26½ 28½ 30½ 32½ 34½ 36½ 38½ 40½ 42½ 44½ 46½ 48½ 50½ 52½ 54½ 56½ 58½ 60½ 62½ 64½ 66½ 68½ 70½ 72½ 74½ 76½ 78½ 80½ 82½ 84½ 86½ 88½ 90½ **Estate Sales.**  
The best County medium for Advertising Sales of  
Estates is  
**THE WORCESTER HERALD**, the largest  
and leading County paper. Extensive circulation among  
the upper and middle classes in Worcestershire and adjoining  
counties. Advertisers would do well to forward for reference  
and distribution, plans and particulars of Estates, Catalogues  
of Machinery, Furniture, Books, and other property advertised  
in the columns of the *Worcester Herald*. Specimen copies sent  
free. Published Friday for Saturday, price 2d.  
Offices, 72, High Street, Worcester.

**Sales of Stock and Agricultural Effects.**  
**THE WORCESTER HERALD** is the most  
effective organ for giving publicity to announcements  
of this class. It is the largest and leading Agricultural paper  
in the county, and circulates most extensively among Agri-  
culturalists in and around Worcestershire. Specimen copies free.  
Published Friday for Saturday, price 2d.  
Offices, 72, High Street, Worcester.

**Farms to be Let.**  
LAND AGENTS, ESTATE MANAGERS, and all having Farms  
to Let, would do well to advertise in  
**THE WORCESTER HERALD**, the Largest  
and Leading County Paper. Specially adapted for  
bringing such notices before Tenant Farmers. Large Circula-  
tion, moderate charge. Specimen free. Price 2d. Published  
Friday for Saturday.  
Offices, 72, High Street, Worcester.

**REVUE DE HORTICULTURE BELGE**  
et **ETRANGER** (Belgian and Foreign Horticultural  
Review)—18th year.—Among the principal Contributors are:—  
A. Allard, E. André, C. Ballet, F. Burvenich, F. Crépin,  
O. de Kerchove de Denterghem, P. E. de Puydt, A. M. C.

Ghent.

## DR. SMILES'S WORKS.

**LIVES OF THE ENGINEERS.** Illustrated.  
5 vols. 7s. 6d. each.  
"We cannot but refer to the captivating and instructive  
volumes, which Dr. Smiles has devoted to the 'Lives of the  
Engineers,' a record not before attempted of the  
achievements of a race of men who have conferred the  
highest honour and the most extensive benefits on their  
country."—*Edinburgh Review*.  
**LIFE OF GEORGE STEPHENSON.** With  
Illustrations. 21s. 6d.  
"We have read this book with unmingled satisfaction.  
We hardly ever remember to have read a biography so  
thoroughly unaffected. . . . It is an artless attempt  
to set out the character and career of one of the most in-  
genious, honest, resolute, hardy, and kind-hearted of  
human beings. The entire style of the work is unambig-  
uous, lucid, thoroughly manly, and good."—*Saturday  
Review*.

**JAMES NASMYTH, ENGINEER: AN AUTO-  
BIOGRAPHY.** Illustrated. 6s.  
"The whole range of literary biography may be searched  
in vain for a more interesting record of an active, useful,  
successful, and happy life, than is presented by the deli-  
cious autobiography of James Nasmyth."—*Edinburgh Review*.  
A few copies of the Life, with Edition, with Portrait  
etched by Rajen, 8vo, 18s., may still be obtained.

**LIFE AND LABOUR; OR, CHARACTERISTICS  
OF MEN OF INDUSTRY, TALENT, AND GENIUS.** 6s.  
**MEN OF INVENTION AND INDUSTRY.** 6s.

6s. each.  
**SELF-HELP. THRIFT.  
CHARACTER. DUTY.**  
**SELF-HELP IN FRENCH.** 5s.

**INDUSTRIAL BIOGRAPHY.** 6s.  
**LIFE OF THOMAS EDWARD, SCOTCH  
NATURALIST.** Illustrated by GEORGE REID, R.S.A. 6s.  
**LIFE OF ROBERT DICK: GEOLOGIST AND  
BOTANIST.** Illustrated. 12s.

**JOHN MURRAY, Albermarle Street, W.**

"Destined to become the fruit garden of the  
Universe."—*The Times*.  
**THE AUSTRALIAN IRRIGATION  
COLONIES.** Illustrated: 3s. 6d., all Bookellers.  
CHAFFEY BROS. (Ltd.), 35, Queen Victoria Street, E.C.  
Pamphlet free.

### GARDENING APPOINTMENTS.

MR. McDUGALL, lately with Mr. C. R. LAWSON, Nunnykirk Hall Gardens, Morpeth, has been appointed Head Gardener to L. E. AMES, Esq., Linden Hall, Morpeth.

MR. F. SINGLETON, for the past four years Foreman at Inwood House Gardens, Henstridge, Bradford, has been engaged as Gardener to J. M. BURRAB, Esq., Mastic Hall, Bournemouth.

MR. JOHN BRACHER, for the past six years in the gardens at Inwood House, has been engaged as Gardener to H. B. BATTEN, Esq., Hollands House, Yeovil, Somerset.

### WANT PLACES.

Letters addressed "Poste Restante" to initials or to fictitious names are not forwarded, but are at once returned to the writers.

**NOTICE TO ADVERTISERS.**—In many instances Remittances in Payment of Repeat Advertisements are received without name, address, or anything beyond the postmark on envelope by which to identify the sender; this in all cases causes a very great deal of trouble, and frequently the sender cannot be identified at all.

Advertisers are requested when desiring to give their Names and Addresses, and also a Reference to the Advertisement which they wish repeated.

**POSTAL ORDERS.**—To Advertisers, Subscribers, and Others.—It is very important in Remitting by Postal Order that it should be payable to No. 42, *THE LANCET*, 17, to W. RICHARDS, as, unless the number of a Postal Order is known, and it has been made payable at a particular office, and to a particular person, it is impossible to prevent any person into whose hands it may fall from negotiating it.

N.B.—The best and safest means of Remitting is by POST-OFFICE ORDER.

Gardeners, Foresters, Land Stewards.
